

# Vulkan® 1.1.129 - A Specification (with all registered Vulkan extensions)

The Khronos® Vulkan Working Group

Version 1.1.129, 2019-11-24 13:26:36Z

# Table of Contents

1. Introduction .....	3
1.1. Document Conventions .....	3
2. Fundamentals .....	5
2.1. Host and Device Environment .....	5
2.2. Execution Model .....	5
2.3. Object Model .....	7
2.4. Application Binary Interface .....	11
2.5. Command Syntax and Duration .....	12
2.6. Threading Behavior .....	13
2.7. Errors .....	24
2.8. Numeric Representation and Computation .....	44
2.9. Fixed-Point Data Conversions .....	46
2.10. Common Object Types .....	47
3. Initialization .....	49
3.1. Command Function Pointers .....	49
3.2. Instances .....	52
4. Devices and Queues .....	62
4.1. Physical Devices .....	62
4.2. Devices .....	82
4.3. Queues .....	94
5. Command Buffers .....	102
5.1. Command Buffer Lifecycle .....	102
5.2. Command Pools .....	104
5.3. Command Buffer Allocation and Management .....	110
5.4. Command Buffer Recording .....	114
5.5. Command Buffer Submission .....	121
5.6. Queue Forward Progress .....	135
5.7. Secondary Command Buffer Execution .....	136
5.8. Command Buffer Device Mask .....	139
6. Synchronization and Cache Control .....	142
6.1. Execution and Memory Dependencies .....	142
6.2. Implicit Synchronization Guarantees .....	159
6.3. Fences .....	161
6.4. Semaphores .....	185
6.5. Events .....	211
6.6. Pipeline Barriers .....	224
6.7. Memory Barriers .....	230
6.8. Wait Idle Operations .....	239

6.9. Host Write Ordering Guarantees . . . . .	240
6.10. Synchronization and Multiple Physical Devices . . . . .	241
6.11. Calibrated timestamps . . . . .	241
7. Render Pass . . . . .	245
7.1. Render Pass Creation . . . . .	246
7.2. Render Pass Compatibility . . . . .	295
7.3. Framebuffers . . . . .	295
7.4. Render Pass Commands . . . . .	305
8. Shaders . . . . .	326
8.1. Shader Modules . . . . .	326
8.2. Shader Execution . . . . .	330
8.3. Shader Memory Access Ordering . . . . .	330
8.4. Shader Inputs and Outputs . . . . .	331
8.5. Task Shaders . . . . .	331
8.6. Mesh Shaders . . . . .	332
8.7. Vertex Shaders . . . . .	332
8.8. Tessellation Control Shaders . . . . .	333
8.9. Tessellation Evaluation Shaders . . . . .	333
8.10. Geometry Shaders . . . . .	334
8.11. Fragment Shaders . . . . .	334
8.12. Compute Shaders . . . . .	336
8.13. Interpolation Decorations . . . . .	336
8.14. Ray Generation Shaders . . . . .	338
8.15. Intersection Shaders . . . . .	338
8.16. Any-Hit Shaders . . . . .	338
8.17. Closest Hit Shaders . . . . .	339
8.18. Miss Shaders . . . . .	339
8.19. Callable Shaders . . . . .	339
8.20. Static Use . . . . .	339
8.21. Invocation and Derivative Groups . . . . .	340
8.22. Subgroups . . . . .	340
8.23. Cooperative Matrices . . . . .	342
8.24. Validation Cache . . . . .	346
9. Pipelines . . . . .	353
9.1. Compute Pipelines . . . . .	354
9.2. Graphics Pipelines . . . . .	363
9.3. Pipeline destruction . . . . .	379
9.4. Multiple Pipeline Creation . . . . .	380
9.5. Pipeline Derivatives . . . . .	381
9.6. Pipeline Cache . . . . .	381
9.7. Specialization Constants . . . . .	388

9.8. Pipeline Binding .....	391
9.9. Dynamic State .....	394
9.10. Pipeline Shader Information .....	395
9.11. Pipeline Compiler Control .....	407
9.12. Ray Tracing Pipeline .....	407
9.13. Pipeline Creation Feedback .....	415
10. Memory Allocation .....	418
10.1. Host Memory .....	418
10.2. Device Memory .....	425
11. Resource Creation .....	489
11.1. Buffers .....	489
11.2. Buffer Views .....	498
11.3. Images .....	503
11.4. Image Layouts .....	536
11.5. Image Views .....	540
11.6. Resource Memory Association .....	558
11.7. Resource Sharing Mode .....	587
11.8. Memory Aliasing .....	589
11.9. Acceleration Structures .....	591
12. Samplers .....	606
12.1. Sampler Y'CbCr conversion .....	615
13. Resource Descriptors .....	625
13.1. Descriptor Types .....	625
13.2. Descriptor Sets .....	629
13.3. Physical Storage Buffer Access .....	699
14. Shader Interfaces .....	702
14.1. Shader Input and Output Interfaces .....	702
14.2. Vertex Input Interface .....	706
14.3. Fragment Output Interface .....	706
14.4. Fragment Input Attachment Interface .....	707
14.5. Shader Resource Interface .....	708
14.6. Built-In Variables .....	716
15. Image Operations .....	744
15.1. Image Operations Overview .....	744
15.2. Conversion Formulas .....	748
15.3. Texel Input Operations .....	749
15.4. Texel Output Operations .....	765
15.5. Derivative Operations .....	767
15.6. Normalized Texel Coordinate Operations .....	768
15.7. Unnormalized Texel Coordinate Operations .....	775
15.8. Integer Texel Coordinate Operations .....	776

15.9. Image Sample Operations .....	777
15.10. Texel Footprint Evaluation .....	781
15.11. Image Operation Steps .....	783
16. Fragment Density Map Operations .....	785
16.1. Fragment Density Map Operations Overview .....	785
16.2. Fetch Density Value .....	785
16.3. Fragment Area Conversion .....	786
17. Queries .....	788
17.1. Query Pools .....	788
17.2. Query Operation .....	793
17.3. Occlusion Queries .....	812
17.4. Pipeline Statistics Queries .....	813
17.5. Timestamp Queries .....	815
17.6. Performance Queries .....	818
17.7. Transform Feedback Queries .....	821
17.8. Intel performance queries .....	822
18. Clear Commands .....	835
18.1. Clearing Images Outside A Render Pass Instance .....	835
18.2. Clearing Images Inside A Render Pass Instance .....	840
18.3. Clear Values .....	844
18.4. Filling Buffers .....	846
18.5. Updating Buffers .....	847
19. Copy Commands .....	850
19.1. Common Operation .....	850
19.2. Copying Data Between Buffers .....	851
19.3. Copying Data Between Images .....	853
19.4. Copying Data Between Buffers and Images .....	861
19.5. Image Copies with Scaling .....	872
19.6. Resolving Multisample Images .....	881
19.7. Buffer Markers .....	885
20. Drawing Commands .....	888
20.1. Primitive Topologies .....	889
20.2. Primitive Order .....	895
20.3. Programmable Primitive Shading .....	896
20.4. Conditional Rendering .....	929
20.5. Programmable Mesh Shading .....	933
21. Fixed-Function Vertex Processing .....	945
21.1. Vertex Attributes .....	945
21.2. Vertex Input Description .....	950
21.3. Vertex Attribute Divisor in Instanced Rendering .....	955
21.4. Example .....	957

22. Tessellation .....	959
22.1. Tessellator .....	959
22.2. Tessellator Patch Discard .....	961
22.3. Tessellator Spacing .....	961
22.4. Tessellation Primitive Ordering .....	962
22.5. Tessellator Vertex Winding Order .....	962
22.6. Triangle Tessellation .....	963
22.7. Quad Tessellation .....	964
22.8. Isoline Tessellation .....	966
22.9. Tessellation Point Mode .....	966
22.10. Tessellation Pipeline State .....	967
23. Geometry Shading .....	970
23.1. Geometry Shader Input Primitives .....	970
23.2. Geometry Shader Output Primitives .....	971
23.3. Multiple Invocations of Geometry Shaders .....	971
23.4. Geometry Shader Primitive Ordering .....	971
23.5. Geometry Shader Passthrough .....	971
24. Mesh Shading .....	974
24.1. Task Shader Input .....	974
24.2. Task Shader Output .....	974
24.3. Mesh Generation .....	974
24.4. Mesh Shader Input .....	974
24.5. Mesh Shader Output Primitives .....	974
24.6. Mesh Shader Per-View Outputs .....	975
24.7. Mesh Shader Primitive Ordering .....	975
25. Fixed-Function Vertex Post-Processing .....	976
25.1. Transform Feedback .....	976
25.2. Viewport Swizzle .....	984
25.3. Flat Shading .....	986
25.4. Primitive Clipping .....	987
25.5. Clipping Shader Outputs .....	989
25.6. Controlling Viewport W Scaling .....	989
25.7. Coordinate Transformations .....	992
25.8. Controlling the Viewport .....	992
26. Rasterization .....	998
26.1. Discarding Primitives Before Rasterization .....	1003
26.2. Controlling the Vertex Stream Used for Rasterization .....	1003
26.3. Rasterization Order .....	1005
26.4. Multisampling .....	1006
26.5. Custom Sample Locations .....	1009
26.6. Shading Rate Image .....	1012

26.7. Sample Shading . . . . .	1025
26.8. Barycentric Interpolation . . . . .	1025
26.9. Points . . . . .	1027
26.10. Line Segments . . . . .	1028
26.11. Polygons . . . . .	1037
27. Fragment Operations . . . . .	1047
27.1. Early Per-Fragment Tests . . . . .	1047
27.2. Discard Rectangles Test . . . . .	1047
27.3. Scissor Test . . . . .	1051
27.4. Exclusive Scissor Test . . . . .	1053
27.5. Sample Mask . . . . .	1056
27.6. Early Fragment Test Mode . . . . .	1057
27.7. Late Per-Fragment Tests . . . . .	1057
27.8. Mixed attachment samples . . . . .	1057
27.9. Multisample Coverage . . . . .	1058
27.10. Depth and Stencil Operations . . . . .	1059
27.11. Depth Bounds Test . . . . .	1060
27.12. Stencil Test . . . . .	1061
27.13. Depth Test . . . . .	1068
27.14. Representative Fragment Test . . . . .	1069
27.15. Sample Counting . . . . .	1070
27.16. Fragment Coverage To Color . . . . .	1070
27.17. Coverage Reduction . . . . .	1071
28. The Framebuffer . . . . .	1078
28.1. Blending . . . . .	1078
28.2. Logical Operations . . . . .	1096
28.3. Color Write Mask . . . . .	1098
29. Dispatching Commands . . . . .	1100
30. Device-Generated Commands . . . . .	1111
30.1. Features and Limitations . . . . .	1111
30.2. Binding Object Table . . . . .	1113
30.3. Indirect Commands Layout . . . . .	1123
30.4. Indirect Commands Generation . . . . .	1132
31. Sparse Resources . . . . .	1140
31.1. Sparse Resource Features . . . . .	1140
31.2. Sparse Buffers and Fully-Resident Images . . . . .	1141
31.3. Sparse Partially-Resident Buffers . . . . .	1142
31.4. Sparse Partially-Resident Images . . . . .	1142
31.5. Sparse Memory Aliasing . . . . .	1150
31.6. Sparse Resource Implementation Guidelines . . . . .	1150
31.7. Sparse Resource API . . . . .	1152

31.8. Examples .....	1177
32. Window System Integration (WSI) .....	1183
32.1. WSI Platform .....	1183
32.2. WSI Surface .....	1183
32.3. Presenting Directly to Display Devices .....	1205
32.4. Querying for WSI Support .....	1231
32.5. Surface Queries .....	1235
32.6. Full Screen Exclusive Control .....	1259
32.7. Device Group Queries .....	1260
32.8. Display Timing Queries .....	1265
32.9. WSI Swapchain .....	1271
32.10. Hdr Metadata .....	1310
33. Ray Tracing .....	1312
33.1. Ray Tracing Commands .....	1312
33.2. Shader Binding Table .....	1318
33.3. Acceleration Structures .....	1320
34. Extending Vulkan .....	1329
34.1. Instance and Device Functionality .....	1329
34.2. Core Versions .....	1329
34.3. Layers .....	1331
34.4. Extensions .....	1335
34.5. Extension Dependencies .....	1338
34.6. Compatibility Guarantees (Informative) .....	1338
35. Features .....	1343
35.1. Feature Requirements .....	1390
36. Limits .....	1392
36.1. Limit Requirements .....	1436
36.2. Additional Multisampling Capabilities .....	1449
37. Formats .....	1451
37.1. Format Definition .....	1451
37.2. Format Properties .....	1492
37.3. Required Format Support .....	1500
38. Additional Capabilities .....	1517
38.1. Additional Image Capabilities .....	1517
38.2. Additional Buffer Capabilities .....	1539
38.3. Optional Semaphore Capabilities .....	1541
38.4. Optional Fence Capabilities .....	1547
38.5. Timestamp Calibration Capabilities .....	1551
39. Debugging .....	1553
39.1. Debug Utilities .....	1556
39.2. Debug Markers .....	1574

39.3. Debug Report Callbacks .....	1581
39.4. Device Loss Debugging .....	1589
Appendix A: Vulkan Environment for SPIR-V .....	1592
Versions and Formats .....	1592
Capabilities .....	1592
Validation Rules within a Module .....	1598
Precision and Operation of SPIR-V Instructions .....	1606
Compatibility Between SPIR-V Image Formats And Vulkan Formats .....	1611
Appendix B: Memory Model .....	1613
Agent .....	1613
Memory Location .....	1613
Allocation .....	1613
Memory Operation .....	1613
Reference .....	1614
Program-Order .....	1614
Scope .....	1615
Atomic Operation .....	1615
Scoped Modification Order .....	1616
Memory Semantics .....	1616
Release Sequence .....	1618
Synchronizes-With .....	1618
System-Synchronizes-With .....	1620
Private vs. Non-Private .....	1620
Inter-Thread-Happens-Before .....	1620
Happens-Before .....	1621
Availability and Visibility .....	1621
Availability, Visibility, and Domain Operations .....	1623
Availability and Visibility Semantics .....	1624
Per-Instruction Availability and Visibility Semantics .....	1624
Location-Ordered .....	1625
Data Race .....	1626
Visible-To .....	1626
Acyclicity .....	1626
Shader I/O .....	1627
Deallocation .....	1627
Informative Descriptions .....	1628
Tessellation Output Ordering .....	1628
Cooperative Matrix Memory Access .....	1629
Appendix C: Compressed Image Formats .....	1630
Block-Compressed Image Formats .....	1631
ETC Compressed Image Formats .....	1632

ASTC Compressed Image Formats .....	1633
PVRTC Compressed Image Formats .....	1635
Appendix D: Core Revisions (Informative) .....	1636
Version 1.1 .....	1636
Appendix E: Layers & Extensions (Informative) .....	1646
List of Current Extensions .....	1646
List of Deprecated Extensions .....	2001
Appendix F: API Boilerplate .....	2096
Vulkan Header Files .....	2096
Window System-Specific Header Control (Informative) .....	2098
Appendix G: Invariance .....	2101
Repeatability .....	2101
Multi-pass Algorithms .....	2101
Invariance Rules .....	2101
Tessellation Invariance .....	2103
Glossary .....	2105
Common Abbreviations .....	2130
Prefixes .....	2132
Appendix H: Credits (Informative) .....	2133
Working Group Contributors to Vulkan 1.1 and 1.0 .....	2133
Working Group Contributors to Vulkan 1.1 .....	2135
Working Group Contributors to Vulkan 1.0 .....	2137
Other Credits .....	2139

## Copyright 2014-2019 The Khronos Group Inc.

This Specification is protected by copyright laws and contains material proprietary to Khronos. Except as described by these terms, it or any components may not be reproduced, republished, distributed, transmitted, displayed, broadcast or otherwise exploited in any manner without the express prior written permission of Khronos. Khronos grants a conditional copyright license to use and reproduce the unmodified Specification for any purpose, without fee or royalty, EXCEPT no licenses to any patent, trademark or other intellectual property rights are granted under these terms.

Khronos makes no, and expressly disclaims any, representations or warranties, express or implied, regarding this Specification, including, without limitation: merchantability, fitness for a particular purpose, non-infringement of any intellectual property, correctness, accuracy, completeness, timeliness, and reliability. Under no circumstances will Khronos, or any of its Promoters, Contributors or Members, or their respective partners, officers, directors, employees, agents or representatives be liable for any damages, whether direct, indirect, special or consequential damages for lost revenues, lost profits, or otherwise, arising from or in connection with these materials.

This Specification has been created under the Khronos Intellectual Property Rights Policy, which is Attachment A of the Khronos Group Membership Agreement available at [https://www.khronos.org/files/member\\_agreement.pdf](https://www.khronos.org/files/member_agreement.pdf), and which defines the terms 'Scope', 'Compliant Portion', and 'Necessary Patent Claims'. Parties desiring to implement the Specification and make use of Khronos trademarks in relation to that implementation, and receive reciprocal patent license protection under the Khronos Intellectual Property Rights Policy must become Adopters and confirm the implementation as conformant under the process defined by Khronos for this Specification; see <https://www.khronos.org/adopters>.

This Specification contains substantially unmodified functionality from, and is a successor to, Khronos specifications including OpenGL, OpenGL ES and OpenCL.

Some parts of this Specification are purely informative and so are EXCLUDED from the Scope of this Specification. The [Document Conventions](#) section of the [Introduction](#) defines how these parts of the Specification are identified.

Where this Specification uses [technical terminology](#), defined in the [Glossary](#) or otherwise, that refer to enabling technologies that are not expressly set forth in this Specification, those enabling technologies are EXCLUDED from the Scope of this Specification. For clarity, enabling technologies not disclosed with particularity in this Specification (e.g. semiconductor manufacturing technology, hardware architecture, processor architecture or microarchitecture, memory architecture, compiler technology, object oriented technology, basic operating system technology, compression technology, algorithms, and so on) are NOT to be considered expressly set forth; only those application program interfaces and data structures disclosed with particularity are included in the Scope of this Specification.

For purposes of the Khronos Intellectual Property Rights Policy as it relates to the definition of Necessary Patent Claims, all recommended or optional features, behaviors and functionality set forth in this Specification, if implemented, are considered to be included as Compliant Portions.

Where this Specification includes [normative references to external documents](#), only the specifically identified sections of those external documents are INCLUDED in the Scope of this Specification. If not created by Khronos, those external documents may contain contributions from non-members of Khronos not covered by the Khronos Intellectual Property Rights Policy.

This document contains extensions which are not ratified by Khronos, and as such is not a ratified Specification, though it contains text from (and is a superset of) the ratified Vulkan Specification. The ratified versions of the Vulkan Specification can be found at <https://www.khronos.org/registry/vulkan/specs/1.1/html/vkspec.html> (core only) and <https://www.khronos.org/registry/vulkan/specs/1.1-khr-extensions/html/vkspec.html> (core with KHR extensions).

Vulkan and Khronos are registered trademarks of The Khronos Group Inc. ASTC is a trademark of ARM Holdings PLC; OpenCL is a trademark of Apple Inc.; and OpenGL and OpenGL ES are registered trademarks of Hewlett Packard Enterprise, all used under license by Khronos. All other product names, trademarks, and/or company names are used solely for identification and belong to their respective owners.

# Chapter 1. Introduction

This document, referred to as the “Vulkan Specification” or just the “Specification” hereafter, describes the Vulkan Application Programming Interface (API). Vulkan is a C99 API designed for explicit control of low-level graphics and compute functionality.

The canonical version of the Specification is available in the official [Vulkan Registry](https://www.khronos.org/registry/vulkan/) (<https://www.khronos.org/registry/vulkan/>). The source files used to generate the Vulkan specification are stored in the [Vulkan Documentation Repository](https://github.com/KhronosGroup/Vulkan-Docs) (<https://github.com/KhronosGroup/Vulkan-Docs>). The source repository additionally has a public issue tracker and allows the submission of pull requests that improve the specification.

## 1.1. Document Conventions

The Vulkan specification is intended for use by both implementors of the API and application developers seeking to make use of the API, forming a contract between these parties. Specification text may address either party; typically the intended audience can be inferred from context, though some sections are defined to address only one of these parties. (For example, [Valid Usage](#) sections only address application developers). Any requirements, prohibitions, recommendations or options defined by [normative terminology](#) are imposed only on the audience of that text.

*Note*

Structure and enumerated types defined in extensions that were promoted to core in Vulkan 1.1 are now defined in terms of the equivalent Vulkan 1.1 interfaces. This affects the Vulkan Specification, the Vulkan header files, and the corresponding XML Registry.

### 1.1.1. Normative Terminology

Within this specification, the key words **must**, **required**, **should**, **recommended**, **may**, and **optional** are to be interpreted as described in [RFC 2119 - Key words for use in RFCs to Indicate Requirement Levels](https://www.ietf.org/rfc/rfc2119.txt) (<https://www.ietf.org/rfc/rfc2119.txt>). These key words are highlighted in the specification for clarity. In text addressing application developers, their use expresses requirements that apply to application behavior. In text addressing implementors, their use expresses requirements that apply to implementations.

In text addressing application developers, the additional key words **can** and **cannot** are to be interpreted as describing the capabilities of an application, as follows:

#### **can**

This word means that the application is able to perform the action described.

#### **cannot**

This word means that the API and/or the execution environment provide no mechanism through which the application can express or accomplish the action described.

These key words are never used in text addressing implementors.

#### Note

There is an important distinction between **cannot** and **must not**, as used in this Specification. **Cannot** means something the application literally is unable to express or accomplish through the API, while **must not** means something that the application is capable of expressing through the API, but that the consequences of doing so are undefined and potentially unrecoverable for the implementation (see [Errors](#)).

Unless otherwise noted in the section heading, all sections and appendices in this document are normative.

### 1.1.2. Technical Terminology

The Vulkan Specification makes use of common engineering and graphics terms such as **Pipeline**, **Shader**, and **Host** to identify and describe Vulkan API constructs and their attributes, states, and behaviors. The [Glossary](#) defines the basic meanings of these terms in the context of the Specification. The Specification text provides fuller definitions of the terms and may elaborate, extend, or clarify the [Glossary](#) definitions. When a term defined in the [Glossary](#) is used in normative language within the Specification, the definitions within the Specification govern and supersede any meanings the terms may have in other technical contexts (i.e. outside the Specification).

### 1.1.3. Normative References

References to external documents are considered normative references if the Specification uses any of the normative terms defined in [Normative Terminology](#) to refer to them or their requirements, either as a whole or in part.

The following documents are referenced by normative sections of the specification:

IEEE. August, 2008. *IEEE Standard for Floating-Point Arithmetic*. IEEE Std 754-2008. <https://dx.doi.org/10.1109/IEEESTD.2008.4610935>.

Andrew Garrard. *Khronos Data Format Specification, version 1.2* (March, 2019). <https://www.khronos.org/registry/DataFormat/specs/1.2/dataformat.1.2.html>.

John Kessenich. *SPIR-V Extended Instructions for GLSL, Version 1.00* (February 10, 2016). <https://www.khronos.org/registry/spir-v/>.

John Kessenich, Boaz Ouriel, and Raun Krisch. *SPIR-V Specification, Version 1.4, Revision 1, Unified* (December 14, 2018). <https://www.khronos.org/registry/spir-v/>.

Jon Leech and Tobias Hector. *Vulkan Documentation and Extensions: Procedures and Conventions* (July 20, 2019). <https://www.khronos.org/registry/vulkan/specs/1.1/styleguide.html>.

*Vulkan Loader Specification and Architecture Overview* (August, 2016). <https://github.com/KhronosGroup/Vulkan-Loader/blob/master/loader/LoaderAndLayerInterface.md>.

# Chapter 2. Fundamentals

This chapter introduces fundamental concepts including the Vulkan architecture and execution model, API syntax, queues, pipeline configurations, numeric representation, state and state queries, and the different types of objects and shaders. It provides a framework for interpreting more specific descriptions of commands and behavior in the remainder of the Specification.

## 2.1. Host and Device Environment

The Vulkan Specification assumes and requires: the following properties of the host environment with respect to Vulkan implementations:

- The host **must** have runtime support for 8, 16, 32 and 64-bit signed and unsigned two-complement integers, all addressable at the granularity of their size in bytes.
- The host **must** have runtime support for 32- and 64-bit floating-point types satisfying the range and precision constraints in the [Floating Point Computation](#) section.
- The representation and endianness of these types on the host **must** match the representation and endianness of the same types on every physical device supported.

*Note*

Since a variety of data types and structures in Vulkan **may** be accessible by both host and physical device operations, the implementation **should** be able to access such data efficiently in both paths in order to facilitate writing portable and performant applications.

## 2.2. Execution Model

This section outlines the execution model of a Vulkan system.

Vulkan exposes one or more *devices*, each of which exposes one or more *queues* which **may** process work asynchronously to one another. The set of queues supported by a device is partitioned into *families*. Each family supports one or more types of functionality and **may** contain multiple queues with similar characteristics. Queues within a single family are considered *compatible* with one another, and work produced for a family of queues **can** be executed on any queue within that family. This Specification defines four types of functionality that queues **may** support: graphics, compute, transfer, and sparse memory management.

*Note*

A single device **may** report multiple similar queue families rather than, or as well as, reporting multiple members of one or more of those families. This indicates that while members of those families have similar capabilities, they are *not* directly compatible with one another.

Device memory is explicitly managed by the application. Each device **may** advertise one or more heaps, representing different areas of memory. Memory heaps are either device local or host local,

but are always visible to the device. Further detail about memory heaps is exposed via memory types available on that heap. Examples of memory areas that **may** be available on an implementation include:

- *device local* is memory that is physically connected to the device.
- *device local, host visible* is device local memory that is visible to the host.
- *host local, host visible* is memory that is local to the host and visible to the device and host.

On other architectures, there **may** only be a single heap that **can** be used for any purpose.

A Vulkan application controls a set of devices through the submission of command buffers which have recorded device commands issued via Vulkan library calls. The content of command buffers is specific to the underlying implementation and is opaque to the application. Once constructed, a command buffer **can** be submitted once or many times to a queue for execution. Multiple command buffers **can** be built in parallel by employing multiple threads within the application.

Command buffers submitted to different queues **may** execute in parallel or even out of order with respect to one another. Command buffers submitted to a single queue respect [submission order](#), as described further in [synchronization chapter](#). Command buffer execution by the device is also asynchronous to host execution. Once a command buffer is submitted to a queue, control **may** return to the application immediately. Synchronization between the device and host, and between different queues is the responsibility of the application.

### 2.2.1. Queue Operation

Vulkan queues provide an interface to the execution engines of a device. Commands for these execution engines are recorded into command buffers ahead of execution time. These command buffers are then submitted to queues with a *queue submission* command for execution in a number of *batches*. Once submitted to a queue, these commands will begin and complete execution without further application intervention, though the order of this execution is dependent on a number of [implicit and explicit ordering constraints](#).

Work is submitted to queues using queue submission commands that typically take the form `vkQueue*` (e.g. `vkQueueSubmit`, `vkQueueBindSparse`), and optionally take a list of semaphores upon which to wait before work begins and a list of semaphores to signal once work has completed. The work itself, as well as signaling and waiting on the semaphores are all *queue operations*.

Queue operations on different queues have no implicit ordering constraints, and **may** execute in any order. Explicit ordering constraints between queues **can** be expressed with [semaphores](#) and [fences](#).

Command buffer submissions to a single queue respect [submission order](#) and other [implicit ordering guarantees](#), but otherwise **may** overlap or execute out of order. Other types of batches and queue submissions against a single queue (e.g. [sparse memory binding](#)) have no implicit ordering constraints with any other queue submission or batch. Additional explicit ordering constraints between queue submissions and individual batches can be expressed with [semaphores](#) and [fences](#).

Before a fence or semaphore is signaled, it is guaranteed that any previously submitted queue operations have completed execution, and that memory writes from those queue operations are

[available](#) to future queue operations. Waiting on a signaled semaphore or fence guarantees that previous writes that are available are also [visible](#) to subsequent commands.

Command buffer boundaries, both between primary command buffers of the same or different batches or submissions as well as between primary and secondary command buffers, do not introduce any additional ordering constraints. In other words, submitting the set of command buffers (which **can** include executing secondary command buffers) between any semaphore or fence operations execute the recorded commands as if they had all been recorded into a single primary command buffer, except that the current state is [reset](#) on each boundary. Explicit ordering constraints **can** be expressed with [explicit synchronization primitives](#).

There are a few [implicit ordering guarantees](#) between commands within a command buffer, but only covering a subset of execution. Additional explicit ordering constraints can be expressed with the various [explicit synchronization primitives](#).

*Note*

Implementations have significant freedom to overlap execution of work submitted to a queue, and this is common due to deep pipelining and parallelism in Vulkan devices.

Commands recorded in command buffers either perform actions (draw, dispatch, clear, copy, query/timestamp operations, begin/end subpass operations), set state (bind pipelines, descriptor sets, and buffers, set dynamic state, push constants, set render pass/subpass state), or perform synchronization (set/wait events, pipeline barrier, render pass/subpass dependencies). Some commands perform more than one of these tasks. State setting commands update the *current state* of the command buffer. Some commands that perform actions (e.g. draw/dispatch) do so based on the current state set cumulatively since the start of the command buffer. The work involved in performing action commands is often allowed to overlap or to be reordered, but doing so **must** not alter the state to be used by each action command. In general, action commands are those commands that alter framebuffer attachments, read/write buffer or image memory, or write to query pools.

Synchronization commands introduce explicit [execution and memory dependencies](#) between two sets of action commands, where the second set of commands depends on the first set of commands. These dependencies enforce that both the execution of certain [pipeline stages](#) in the later set occur after the execution of certain stages in the source set, and that the effects of [memory accesses](#) performed by certain pipeline stages occur in order and are visible to each other. When not enforced by an explicit dependency or [implicit ordering guarantees](#), action commands **may** overlap execution or execute out of order, and **may** not see the side effects of each other's memory accesses.

The device executes queue operations asynchronously with respect to the host. Control is returned to an application immediately following command buffer submission to a queue. The application **must** synchronize work between the host and device as needed.

## 2.3. Object Model

The devices, queues, and other entities in Vulkan are represented by Vulkan objects. At the API

level, all objects are referred to by handles. There are two classes of handles, dispatchable and non-dispatchable. *Dispatchable* handle types are a pointer to an opaque type. This pointer **may** be used by layers as part of intercepting API commands, and thus each API command takes a dispatchable type as its first parameter. Each object of a dispatchable type **must** have a unique handle value during its lifetime.

*Non-dispatchable* handle types are a 64-bit integer type whose meaning is implementation-dependent, and **may** encode object information directly in the handle rather than acting as a reference to an underlying object. Objects of a non-dispatchable type **may** not have unique handle values within a type or across types. If handle values are not unique, then destroying one such handle **must** not cause identical handles of other types to become invalid, and **must** not cause identical handles of the same type to become invalid if that handle value has been created more times than it has been destroyed.

All objects created or allocated from a `VkDevice` (i.e. with a `VkDevice` as the first parameter) are private to that device, and **must** not be used on other devices.

### 2.3.1. Object Lifetime

Objects are created or allocated by `vkCreate*` and `vkAllocate*` commands, respectively. Once an object is created or allocated, its “structure” is considered to be immutable, though the contents of certain object types is still free to change. Objects are destroyed or freed by `vkDestroy*` and `vkFree*` commands, respectively.

Objects that are allocated (rather than created) take resources from an existing pool object or memory heap, and when freed return resources to that pool or heap. While object creation and destruction are generally expected to be low-frequency occurrences during runtime, allocating and freeing objects **can** occur at high frequency. Pool objects help accommodate improved performance of the allocations and frees.

It is an application’s responsibility to track the lifetime of Vulkan objects, and not to destroy them while they are still in use.

The ownership of application-owned memory is immediately acquired by any Vulkan command it is passed into. Ownership of such memory **must** be released back to the application at the end of the duration of the command, so that the application **can** alter or free this memory as soon as all the commands that acquired it have returned.

The following object types are consumed when they are passed into a Vulkan command and not further accessed by the objects they are used to create. They **must** not be destroyed in the duration of any API command they are passed into:

- `VkShaderModule`
- `VkPipelineCache`
- `VkValidationCacheEXT`

A `VkRenderPass` object passed as a parameter to create another object is not further accessed by that object after the duration of the command it is passed into. A `VkRenderPass` used in a command buffer follows the rules described below.

A `VkPipelineLayout` object **must** not be destroyed while any command buffer that uses it is in the recording state.

`VkDescriptorSetLayout` objects **may** be accessed by commands that operate on descriptor sets allocated using that layout, and those descriptor sets **must** not be updated with `vkUpdateDescriptorSets` after the descriptor set layout has been destroyed. Otherwise, a `VkDescriptorSetLayout` object passed as a parameter to create another object is not further accessed by that object after the duration of the command it is passed into.

The application **must** not destroy any other type of Vulkan object until all uses of that object by the device (such as via command buffer execution) have completed.

The following Vulkan objects **must** not be destroyed while any command buffers using the object are in the [pending state](#):

- `VkEvent`
- `VkQueryPool`
- `VkBuffer`
- `VkBufferView`
- `VkImage`
- `VkImageView`
- `VkPipeline`
- `VkSampler`
- `VkSamplerYcbcrConversion`
- `VkDescriptorPool`
- `VkFramebuffer`
- `VkRenderPass`
- `VkCommandBuffer`
- `VkCommandPool`
- `VkDeviceMemory`
- `VkDescriptorSet`
- `VkObjectTableNVX`
- `VkIndirectCommandsLayoutNVX`

Destroying these objects will move any command buffers that are in the [recording or executable state](#), and are using those objects, to the [invalid state](#).

The following Vulkan objects **must** not be destroyed while any queue is executing commands that use the object:

- `VkFence`
- `VkSemaphore`
- `VkCommandBuffer`
- `VkCommandPool`

In general, objects **can** be destroyed or freed in any order, even if the object being freed is involved in the use of another object (e.g. use of a resource in a view, use of a view in a descriptor set, use of

an object in a command buffer, binding of a memory allocation to a resource), as long as any object that uses the freed object is not further used in any way except to be destroyed or to be reset in such a way that it no longer uses the other object (such as resetting a command buffer). If the object has been reset, then it **can** be used as if it never used the freed object. An exception to this is when there is a parent/child relationship between objects. In this case, the application **must** not destroy a parent object before its children, except when the parent is explicitly defined to free its children when it is destroyed (e.g. for pool objects, as defined below).

`VkCommandPool` objects are parents of `VkCommandBuffer` objects. `VkDescriptorPool` objects are parents of `VkDescriptorSet` objects. `VkDevice` objects are parents of many object types (all that take a `VkDevice` as a parameter to their creation).

The following Vulkan objects have specific restrictions for when they **can** be destroyed:

- `VkQueue` objects **cannot** be explicitly destroyed. Instead, they are implicitly destroyed when the `VkDevice` object they are retrieved from is destroyed.
- Destroying a pool object implicitly frees all objects allocated from that pool. Specifically, destroying `VkCommandPool` frees all `VkCommandBuffer` objects that were allocated from it, and destroying `VkDescriptorPool` frees all `VkDescriptorSet` objects that were allocated from it.
- `VkDevice` objects **can** be destroyed when all `VkQueue` objects retrieved from them are idle, and all objects created from them have been destroyed. This includes the following objects:
  - `VkFence`
  - `VkSemaphore`
  - `VkEvent`
  - `VkQueryPool`
  - `VkBuffer`
  - `VkBufferView`
  - `VkImage`
  - `VkImageView`
  - `VkShaderModule`
  - `VkPipelineCache`
  - `VkPipeline`
  - `VkPipelineLayout`
  - `VkSampler`
  - `VkSamplerYcbcrConversion`
  - `VkDescriptorSetLayout`
  - `VkDescriptorPool`
  - `VkFramebuffer`
  - `VkRenderPass`
  - `VkCommandPool`
  - `VkCommandBuffer`
  - `VkDeviceMemory`
  - `VkValidationCacheEXT`
- `VkPhysicalDevice` objects **cannot** be explicitly destroyed. Instead, they are implicitly destroyed

when the `VkInstance` object they are retrieved from is destroyed.

- `VkInstance` objects **can** be destroyed once all `VkDevice` objects created from any of its `VkPhysicalDevice` objects have been destroyed.

### 2.3.2. External Object Handles

As defined above, the scope of object handles created or allocated from a `VkDevice` is limited to that logical device. Objects which are not in scope are said to be external. To bring an external object into scope, an external handle **must** be exported from the object in the source scope and imported into the destination scope.

*Note*

The scope of external handles and their associated resources **may** vary according to their type, but they **can** generally be shared across process and API boundaries.

## 2.4. Application Binary Interface

The mechanism by which Vulkan is made available to applications is platform- or implementation-defined. On many platforms the C interface described in this Specification is provided by a shared library. Since shared libraries can be changed independently of the applications that use them, they present particular compatibility challenges, and this Specification places some requirements on them.

Shared library implementations **must** use the default Application Binary Interface (ABI) of the standard C compiler for the platform, or provide customized API headers that cause application code to use the implementation’s non-default ABI. An ABI in this context means the size, alignment, and layout of C data types; the procedure calling convention; and the naming convention for shared library symbols corresponding to C functions. Customizing the calling convention for a platform is usually accomplished by defining [calling convention macros](#) appropriately in `vk_platform.h`.

On platforms where Vulkan is provided as a shared library, library symbols beginning with “vk” and followed by a digit or uppercase letter are reserved for use by the implementation. Applications which use Vulkan **must** not provide definitions of these symbols. This allows the Vulkan shared library to be updated with additional symbols for new API versions or extensions without causing symbol conflicts with existing applications.

Shared library implementations **should** provide library symbols for commands in the highest version of this Specification they support, and for [Window System Integration](#) extensions relevant to the platform. They **may** also provide library symbols for commands defined by additional extensions.

### Note

These requirements and recommendations are intended to allow implementors to take advantage of platform-specific conventions for SDKs, ABIs, library versioning mechanisms, etc. while still minimizing the code changes necessary to port applications or libraries between platforms. Platform vendors, or providers of the *de facto* standard Vulkan shared library for a platform, are encouraged to document what symbols the shared library provides and how it will be versioned when new symbols are added.

Applications **should** only rely on shared library symbols for commands in the minimum core version required by the application. `vkGetInstanceProcAddr` and `vkGetDeviceProcAddr` **should** be used to obtain function pointers for commands in core versions beyond the application's minimum required version.

## 2.5. Command Syntax and Duration

The Specification describes Vulkan commands as functions or procedures using C99 syntax. Language bindings for other languages such as C++ and JavaScript **may** allow for stricter parameter passing, or object-oriented interfaces.

Vulkan uses the standard C types for the base type of scalar parameters (e.g. types from `<stdint.h>`), with exceptions described below, or elsewhere in the text when appropriate:

`VkBool32` represents boolean `True` and `False` values, since C does not have a sufficiently portable built-in boolean type:

```
typedef uint32_t VkBool32;
```

`VK_TRUE` represents a boolean `True` (integer 1) value, and `VK_FALSE` a boolean `False` (integer 0) value.

All values returned from a Vulkan implementation in a `VkBool32` will be either `VK_TRUE` or `VK_FALSE`.

Applications **must** not pass any other values than `VK_TRUE` or `VK_FALSE` into a Vulkan implementation where a `VkBool32` is expected.

`VkDeviceSize` represents device memory size and offset values:

```
typedef uint64_t VkDeviceSize;
```

`VkDeviceAddress` represents device buffer address values:

```
typedef uint64_t VkDeviceAddress;
```

Commands that create Vulkan objects are of the form `vkCreate*` and take `Vk*CreateInfo` structures with the parameters needed to create the object. These Vulkan objects are destroyed with

commands of the form `vkDestroy*`.

The last in-parameter to each command that creates or destroys a Vulkan object is `pAllocator`. The `pAllocator` parameter **can** be set to a non-`NULL` value such that allocations for the given object are delegated to an application provided callback; refer to the [Memory Allocation](#) chapter for further details.

Commands that allocate Vulkan objects owned by pool objects are of the form `vkAllocate*`, and take `Vk*AllocateInfo` structures. These Vulkan objects are freed with commands of the form `vkFree*`. These objects do not take allocators; if host memory is needed, they will use the allocator that was specified when their parent pool was created.

Commands are recorded into a command buffer by calling API commands of the form `vkCmd*`. Each such command **may** have different restrictions on where it **can** be used: in a primary and/or secondary command buffer, inside and/or outside a render pass, and in one or more of the supported queue types. These restrictions are documented together with the definition of each such command.

The *duration* of a Vulkan command refers to the interval between calling the command and its return to the caller.

### 2.5.1. Lifetime of Retrieved Results

Information is retrieved from the implementation with commands of the form `vkGet*` and `vkEnumerate*`.

Unless otherwise specified for an individual command, the results are *invariant*; that is, they will remain unchanged when retrieved again by calling the same command with the same parameters, so long as those parameters themselves all remain valid.

## 2.6. Threading Behavior

Vulkan is intended to provide scalable performance when used on multiple host threads. All commands support being called concurrently from multiple threads, but certain parameters, or components of parameters are defined to be *externally synchronized*. This means that the caller **must** guarantee that no more than one thread is using such a parameter at a given time.

More precisely, Vulkan commands use simple stores to update the state of Vulkan objects. A parameter declared as externally synchronized **may** have its contents updated at any time during the host execution of the command. If two commands operate on the same object and at least one of the commands declares the object to be externally synchronized, then the caller **must** guarantee not only that the commands do not execute simultaneously, but also that the two commands are separated by an appropriate memory barrier (if needed).

*Note*

Memory barriers are particularly relevant for hosts based on the ARM CPU architecture, which is more weakly ordered than many developers are accustomed to from x86/x64 programming. Fortunately, most higher-level synchronization primitives (like the pthread library) perform memory barriers as a part of mutual exclusion, so mutexing Vulkan objects via these primitives will have the desired effect.

Similarly the application **must** avoid any potential data hazard of application-owned memory that has its [ownership temporarily acquired](#) by a Vulkan command. While the ownership of application-owned memory remains acquired by a command the implementation **may** read the memory at any point, and it **may** write non-**const** qualified memory at any point. Parameters referring to non-**const** qualified application-owned memory are not marked explicitly as *externally synchronized* in the Specification.

Many object types are *immutable*, meaning the objects **cannot** change once they have been created. These types of objects never need external synchronization, except that they **must** not be destroyed while they are in use on another thread. In certain special cases mutable object parameters are internally synchronized, making external synchronization unnecessary. One example of this is the use of a `VkPipelineCache` in `vkCreateGraphicsPipelines` and `vkCreateComputePipelines`, where external synchronization around such a heavyweight command would be impractical. The implementation **must** internally synchronize the cache in this example, and **may** be able to do so in the form of a much finer-grained mutex around the command. Any command parameters that are not labeled as externally synchronized are either not mutated by the command or are internally synchronized. Additionally, certain objects related to a command's parameters (e.g. command pools and descriptor pools) **may** be affected by a command, and **must** also be externally synchronized. These implicit parameters are documented as described below.

Parameters of commands that are externally synchronized are listed below.

## Externally Synchronized Parameters

- The `instance` parameter in `vkDestroyInstance`
- The `device` parameter in `vkDestroyDevice`
- The `queue` parameter in `vkQueueSubmit`
- The `fence` parameter in `vkQueueSubmit`
- The `queue` parameter in `vkQueueWaitIdle`
- The `memory` parameter in `vkFreeMemory`
- The `memory` parameter in `vkMapMemory`
- The `memory` parameter in `vkUnmapMemory`
- The `buffer` parameter in `vkBindBufferMemory`
- The `image` parameter in `vkBindImageMemory`
- The `queue` parameter in `vkQueueBindSparse`
- The `fence` parameter in `vkQueueBindSparse`
- The `fence` parameter in `vkDestroyFence`
- The `semaphore` parameter in `vkDestroySemaphore`
- The `event` parameter in `vkDestroyEvent`
- The `event` parameter in `vkSetEvent`
- The `event` parameter in `vkResetEvent`
- The `queryPool` parameter in `vkDestroyQueryPool`
- The `buffer` parameter in `vkDestroyBuffer`
- The `bufferView` parameter in `vkDestroyBufferView`
- The `image` parameter in `vkDestroyImage`
- The `imageView` parameter in `vkDestroyImageView`
- The `shaderModule` parameter in `vkDestroyShaderModule`
- The `pipelineCache` parameter in `vkDestroyPipelineCache`
- The `dstCache` parameter in `vkMergePipelineCaches`
- The `pipeline` parameter in `vkDestroyPipeline`
- The `pipelineLayout` parameter in `vkDestroyPipelineLayout`
- The `sampler` parameter in `vkDestroySampler`
- The `descriptorsetLayout` parameter in `vkDestroyDescriptorSetLayout`
- The `descriptorPool` parameter in `vkDestroyDescriptorPool`
- The `descriptorPool` parameter in `vkResetDescriptorPool`
- The `descriptorPool` member of the `pAllocateInfo` parameter in `vkAllocateDescriptorSets`
- The `descriptorPool` parameter in `vkFreeDescriptorSets`

- The `framebuffer` parameter in `vkDestroyFramebuffer`
- The `renderPass` parameter in `vkDestroyRenderPass`
- The `commandPool` parameter in `vkDestroyCommandPool`
- The `commandPool` parameter in `vkResetCommandPool`
- The `commandPool` member of the `pAllocateInfo` parameter in `vkAllocateCommandBuffers`
- The `commandPool` parameter in `vkFreeCommandBuffers`
- The `commandBuffer` parameter in `vkBeginCommandBuffer`
- The `commandBuffer` parameter in `vkEndCommandBuffer`
- The `commandBuffer` parameter in `vkResetCommandBuffer`
- The `commandBuffer` parameter in `vkCmdBindPipeline`
- The `commandBuffer` parameter in `vkCmdSetViewport`
- The `commandBuffer` parameter in `vkCmdSetScissor`
- The `commandBuffer` parameter in `vkCmdSetLineWidth`
- The `commandBuffer` parameter in `vkCmdSetDepthBias`
- The `commandBuffer` parameter in `vkCmdSetBlendConstants`
- The `commandBuffer` parameter in `vkCmdSetDepthBounds`
- The `commandBuffer` parameter in `vkCmdSetStencilCompareMask`
- The `commandBuffer` parameter in `vkCmdSetStencilWriteMask`
- The `commandBuffer` parameter in `vkCmdSetStencilReference`
- The `commandBuffer` parameter in `vkCmdBindDescriptorSets`
- The `commandBuffer` parameter in `vkCmdBindIndexBuffer`
- The `commandBuffer` parameter in `vkCmdBindVertexBuffers`
- The `commandBuffer` parameter in `vkCmdDraw`
- The `commandBuffer` parameter in `vkCmdDrawIndexed`
- The `commandBuffer` parameter in `vkCmdDrawIndirect`
- The `commandBuffer` parameter in `vkCmdDrawIndexedIndirect`
- The `commandBuffer` parameter in `vkCmdDispatch`
- The `commandBuffer` parameter in `vkCmdDispatchIndirect`
- The `commandBuffer` parameter in `vkCmdCopyBuffer`
- The `commandBuffer` parameter in `vkCmdCopyImage`
- The `commandBuffer` parameter in `vkCmdBlitImage`
- The `commandBuffer` parameter in `vkCmdCopyBufferToImage`
- The `commandBuffer` parameter in `vkCmdCopyImageToBuffer`
- The `commandBuffer` parameter in `vkCmdUpdateBuffer`
- The `commandBuffer` parameter in `vkCmdFillBuffer`

- The `commandBuffer` parameter in `vkCmdClearColorImage`
- The `commandBuffer` parameter in `vkCmdClearDepthStencilImage`
- The `commandBuffer` parameter in `vkCmdClearAttachments`
- The `commandBuffer` parameter in `vkCmdResolveImage`
- The `commandBuffer` parameter in `vkCmdSetEvent`
- The `commandBuffer` parameter in `vkCmdResetEvent`
- The `commandBuffer` parameter in `vkCmdWaitEvents`
- The `commandBuffer` parameter in `vkCmdPipelineBarrier`
- The `commandBuffer` parameter in `vkCmdBeginQuery`
- The `commandBuffer` parameter in `vkCmdEndQuery`
- The `commandBuffer` parameter in `vkCmdResetQueryPool`
- The `commandBuffer` parameter in `vkCmdWriteTimestamp`
- The `commandBuffer` parameter in `vkCmdCopyQueryPoolResults`
- The `commandBuffer` parameter in `vkCmdPushConstants`
- The `commandBuffer` parameter in `vkCmdBeginRenderPass`
- The `commandBuffer` parameter in `vkCmdNextSubpass`
- The `commandBuffer` parameter in `vkCmdEndRenderPass`
- The `commandBuffer` parameter in `vkCmdExecuteCommands`
- The `commandBuffer` parameter in `vkCmdSetDeviceMask`
- The `commandBuffer` parameter in `vkCmdDispatchBase`
- The `commandPool` parameter in `vkTrimCommandPool`
- The `ycbcrConversion` parameter in `vkDestroySamplerYcbcrConversion`
- The `descriptorUpdateTemplate` parameter in `vkDestroyDescriptorUpdateTemplate`
- The `descriptorSet` parameter in `vkUpdateDescriptorSetWithTemplate`
- The `surface` parameter in `vkDestroySurfaceKHR`
- The `surface` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`
- The `oldSwapchain` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`
- The `swapchain` parameter in `vkDestroySwapchainKHR`
- The `swapchain` parameter in `vkAcquireNextImageKHR`
- The `semaphore` parameter in `vkAcquireNextImageKHR`
- The `fence` parameter in `vkAcquireNextImageKHR`
- The `queue` parameter in `vkQueuePresentKHR`
- The `surface` parameter in `vkGetDeviceGroupSurfacePresentModesKHR`
- The `surface` parameter in `vkGetPhysicalDevicePresentRectanglesKHR`
- The `display` parameter in `vkCreateDisplayModeKHR`

- The `mode` parameter in `vkGetDisplayPlaneCapabilitiesKHR`
- The `commandBuffer` parameter in `vkCmdSetDeviceMaskKHR`
- The `commandBuffer` parameter in `vkCmdDispatchBaseKHR`
- The `commandPool` parameter in `vkTrimCommandPoolKHR`
- The `commandBuffer` parameter in `vkCmdPushDescriptorSetKHR`
- The `commandBuffer` parameter in `vkCmdPushDescriptorSetWithTemplateKHR`
- The `descriptorUpdateTemplate` parameter in `vkDestroyDescriptorUpdateTemplateKHR`
- The `descriptorSet` parameter in `vkUpdateDescriptorSetWithTemplateKHR`
- The `commandBuffer` parameter in `vkCmdBeginRenderPass2KHR`
- The `commandBuffer` parameter in `vkCmdNextSubpass2KHR`
- The `commandBuffer` parameter in `vkCmdEndRenderPass2KHR`
- The `swapchain` parameter in `vkGetSwapchainStatusKHR`
- The `yCbCrConversion` parameter in `vkDestroySamplerYcbcrConversionKHR`
- The `commandBuffer` parameter in `vkCmdDrawIndirectCountKHR`
- The `commandBuffer` parameter in `vkCmdDrawIndexedIndirectCountKHR`
- The `callback` parameter in `vkDestroyDebugReportCallbackEXT`
- The `object` member of the `pTagInfo` parameter in `vkDebugMarkerSetObjectTagEXT`
- The `object` member of the `pNameInfo` parameter in `vkDebugMarkerSetObjectNameEXT`
- The `commandBuffer` parameter in `vkCmdBindTransformFeedbackBuffersEXT`
- The `commandBuffer` parameter in `vkCmdBeginTransformFeedbackEXT`
- The `commandBuffer` parameter in `vkCmdEndTransformFeedbackEXT`
- The `commandBuffer` parameter in `vkCmdBeginQueryIndexedEXT`
- The `commandBuffer` parameter in `vkCmdEndQueryIndexedEXT`
- The `commandBuffer` parameter in `vkCmdDrawIndirectByteCountEXT`
- The `commandBuffer` parameter in `vkCmdDrawIndirectCountAMD`
- The `commandBuffer` parameter in `vkCmdDrawIndexedIndirectCountAMD`
- The `commandBuffer` parameter in `vkCmdBeginConditionalRenderingEXT`
- The `commandBuffer` parameter in `vkCmdEndConditionalRenderingEXT`
- The `commandBuffer` parameter in `vkCmdProcessCommandsNVX`
- The `commandBuffer` parameter in `vkCmdReserveSpaceForCommandsNVX`
- The `objectTable` parameter in `vkDestroyObjectTableNVX`
- The `objectTable` parameter in `vkRegisterObjectsNVX`
- The `objectTable` parameter in `vkUnregisterObjectsNVX`
- The `commandBuffer` parameter in `vkCmdSetViewportWScalingNV`
- The `swapchain` parameter in `vkGetRefreshCycleDurationGOOGLE`

- The `swapchain` parameter in `vkGetPastPresentationTimingGOOGLE`
- The `commandBuffer` parameter in `vkCmdSetDiscardRectangleEXT`
- The `objectHandle` member of the `pNameInfo` parameter in `vkSetDebugUtilsObjectNameEXT`
- The `objectHandle` member of the `pTagInfo` parameter in `vkSetDebugUtilsObjectTagEXT`
- The `messenger` parameter in `vkDestroyDebugUtilsMessengerEXT`
- The `commandBuffer` parameter in `vkCmdSetSampleLocationsEXT`
- The `validationCache` parameter in `vkDestroyValidationCacheEXT`
- The `dstCache` parameter in `vkMergeValidationCachesEXT`
- The `commandBuffer` parameter in `vkCmdBindShadingRateImageNV`
- The `commandBuffer` parameter in `vkCmdSetViewportShadingRatePaletteNV`
- The `commandBuffer` parameter in `vkCmdSetCoarseSampleOrderNV`
- The `commandBuffer` parameter in `vkCmdWriteBufferMarkerAMD`
- The `commandBuffer` parameter in `vkCmdDrawMeshTasksNV`
- The `commandBuffer` parameter in `vkCmdDrawMeshTasksIndirectNV`
- The `commandBuffer` parameter in `vkCmdDrawMeshTasksIndirectCountNV`
- The `commandBuffer` parameter in `vkCmdSetExclusiveScissorNV`
- The `commandBuffer` parameter in `vkCmdSetLineStippleEXT`

There are also a few instances where a command **can** take in a user allocated list whose contents are externally synchronized parameters. In these cases, the caller **must** guarantee that at most one thread is using a given element within the list at a given time. These parameters are listed below.

## Externally Synchronized Parameter Lists

- The `buffer` member of each element of the `pBufferBinds` member of each element of the `pBindInfo` parameter in [vkQueueBindSparse](#)
- The `image` member of each element of the `pImageOpaqueBinds` member of each element of the `pBindInfo` parameter in [vkQueueBindSparse](#)
- The `image` member of each element of the `pImageBinds` member of each element of the `pBindInfo` parameter in [vkQueueBindSparse](#)
- Each element of the `pFences` parameter in [vkResetFences](#)
- Each element of the `pDescriptorSets` parameter in [vkFreeDescriptorSets](#)
- The `dstSet` member of each element of the `pDescriptorWrites` parameter in [vkUpdateDescriptorSets](#)
- The `dstSet` member of each element of the `pDescriptorCopies` parameter in [vkUpdateDescriptorSets](#)
- Each element of the `pCommandBuffers` parameter in [vkFreeCommandBuffers](#)
- Each element of the `pWaitSemaphores` member of the `pPresentInfo` parameter in [vkQueuePresentKHR](#)
- Each element of the `pSwapchains` member of the `pPresentInfo` parameter in [vkQueuePresentKHR](#)
- The `surface` member of each element of the `pCreateInfos` parameter in [vkCreateSharedSwapchainsKHR](#)
- The `oldSwapchain` member of each element of the `pCreateInfos` parameter in [vkCreateSharedSwapchainsKHR](#)

In addition, there are some implicit parameters that need to be externally synchronized. For example, all `commandBuffer` parameters that need to be externally synchronized imply that the `commandPool` that was passed in when creating that command buffer also needs to be externally synchronized. The implicit parameters and their associated object are listed below.

## Implicit Externally Synchronized Parameters

- All `VkQueue` objects created from `device` in `vkDeviceWaitIdle`
- Any `VkDescriptorSet` objects allocated from `descriptorPool` in `vkResetDescriptorPool`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkBeginCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkEndCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindPipeline`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetViewport`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetScissor`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetLineWidth`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBias`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetBlendConstants`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDepthBounds`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilCompareMask`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilWriteMask`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetStencilReference`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindDescriptorSets`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindIndexBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindVertexBuffers`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDraw`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexed`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndirect`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexedIndirect`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatch`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatchIndirect`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBlitImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyBufferToImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyImageToBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdUpdateBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdFillBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdClearColorImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdClearDepthImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdClearIndexImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdClearStencilImage`

## [vkCmdClearDepthStencilImage](#)

- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdClearAttachments`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResolveImage`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetEvent`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResetEvent`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWaitEvents`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPipelineBarrier`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginQuery`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndQuery`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdResetQueryPool`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdWriteTimestamp`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdCopyQueryPoolResults`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPushConstants`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginRenderPass`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdNextSubpass`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndRenderPass`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdExecuteCommands`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDeviceMask`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatchBase`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDeviceMaskKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDispatchBaseKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPushDescriptorSetKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdPushDescriptorSetWithTemplateKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginRenderPass2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdNextSubpass2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndRenderPass2KHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndirectCountKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexedIndirectCountKHR`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDebugMarkerBeginEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDebugMarkerEndEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDebugMarkerInsertEXT`

- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindTransformFeedbackBuffersEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginTransformFeedbackEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndTransformFeedbackEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginQueryIndexedEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndQueryIndexedEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndirectByteCountEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndirectCountAMD`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawIndexedIndirectCountAMD`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginConditionalRenderingEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndConditionalRenderingEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdProcessCommandsNVX`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdReserveSpaceForCommandsNVX`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetViewportWScalingNV`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetDiscardRectangleEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBeginDebugUtilsLabelEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdEndDebugUtilsLabelEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdInsertDebugUtilsLabelEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetSampleLocationsEXT`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindShadingRateImageNV`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetViewportShadingRatePaletteNV`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetCoarseSampleOrderNV`

- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdDrawMeshTasksIndirectCountNV`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetExclusiveScissorNV`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetCheckpointNV`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetPerformanceMarkerINTEL`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetPerformanceStreamMarkerINTEL`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetPerformanceOverrideINTEL`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetLineStippleEXT`

## 2.7. Errors

Vulkan is a layered API. The lowest layer is the core Vulkan layer, as defined by this Specification. The application **can** use additional layers above the core for debugging, validation, and other purposes.

One of the core principles of Vulkan is that building and submitting command buffers **should** be highly efficient. Thus error checking and validation of state in the core layer is minimal, although more rigorous validation **can** be enabled through the use of layers.

The core layer assumes applications are using the API correctly. Except as documented elsewhere in the Specification, the behavior of the core layer to an application using the API incorrectly is undefined, and **may** include program termination. However, implementations **must** ensure that incorrect usage by an application does not affect the integrity of the operating system, the Vulkan implementation, or other Vulkan client applications in the system. In particular, any guarantees made by an operating system about whether memory from one process **can** be visible to another process or not **must** not be violated by a Vulkan implementation for **any memory allocation**. Vulkan implementations are not **required** to make additional security or integrity guarantees

beyond those provided by the OS unless explicitly directed by the application's use of a particular feature or extension.

*Note*

For instance, if an operating system guarantees that data in all its memory allocations are set to zero when newly allocated, the Vulkan implementation **must** make the same guarantees for any allocations it controls (e.g. `VkDeviceMemory`).

Similarly, if an operating system guarantees that use-after-free of host allocations will not result in values written by another process becoming visible, the same guarantees **must** be made by the Vulkan implementation for device memory.

If the [protected memory](#) feature is supported, the implementation provides additional guarantees when invalid usage occurs to prevent values in protected memory from being accessed or inferred outside of protected operations, as described in [Protected Memory Access Rules](#).

Validation of correct API usage is left to validation layers. Applications **should** be developed with validation layers enabled, to help catch and eliminate errors. Once validated, released applications **should** not enable validation layers by default.

### 2.7.1. Valid Usage

Valid usage defines a set of conditions which **must** be met in order to achieve well-defined run-time behavior in an application. These conditions depend only on Vulkan state, and the parameters or objects whose usage is constrained by the condition.

Some valid usage conditions have dependencies on run-time limits or feature availability. It is possible to validate these conditions against Vulkan's minimum supported values for these limits and features, or some subset of other known values.

Valid usage conditions do not cover conditions where well-defined behavior (including returning an error code) exists.

Valid usage conditions **should** apply to the command or structure where complete information about the condition would be known during execution of an application. This is such that a validation layer or linter **can** be written directly against these statements at the point they are specified.

#### Note

This does lead to some non-obvious places for valid usage statements. For instance, the valid values for a structure might depend on a separate value in the calling command. In this case, the structure itself will not reference this valid usage as it is impossible to determine validity from the structure that it is invalid - instead this valid usage would be attached to the calling command.

Another example is draw state - the state setters are independent, and can cause a legitimately invalid state configuration between draw calls; so the valid usage statements are attached to the place where all state needs to be valid - at the draw command.

Valid usage conditions are described in a block labelled “Valid Usage” following each command or structure they apply to.

### 2.7.2. Implicit Valid Usage

Some valid usage conditions apply to all commands and structures in the API, unless explicitly denoted otherwise for a specific command or structure. These conditions are considered *implicit*, and are described in a block labelled “Valid Usage (Implicit)” following each command or structure they apply to. Implicit valid usage conditions are described in detail below.

#### Valid Usage for Object Handles

Any input parameter to a command that is an object handle **must** be a valid object handle, unless otherwise specified. An object handle is valid if:

- It has been created or allocated by a previous, successful call to the API. Such calls are noted in the Specification.
- It has not been deleted or freed by a previous call to the API. Such calls are noted in the Specification.
- Any objects used by that object, either as part of creation or execution, **must** also be valid.

The reserved values `VK_NULL_HANDLE` and `NULL` **can** be used in place of valid non-dispatchable handles and dispatchable handles, respectively, when *explicitly called out in the Specification*. Any command that creates an object successfully **must** not return these values. It is valid to pass these values to `vkDestroy*` or `vkFree*` commands, which will silently ignore these values.

#### Valid Usage for Pointers

Any parameter that is a pointer **must** be a *valid pointer* only if it is explicitly called out by a Valid Usage statement.

A pointer is “valid” if it points at memory containing values of the number and type(s) expected by the command, and all fundamental types accessed through the pointer (e.g. as elements of an array or as members of a structure) satisfy the alignment requirements of the host processor.

## Valid Usage for Strings

Any parameter that is a pointer to `char` **must** be a finite sequence of values terminated by a null character, or if *explicitly called out in the Specification*, **can** be `NULL`.

## Valid Usage for Enumerated Types

Any parameter of an enumerated type **must** be a valid enumerant for that type. A enumerant is valid if:

- The enumerant is defined as part of the enumerated type.
- The enumerant is not one of the special values defined for the enumerated type, which are suffixed with `_BEGIN_RANGE`, `_END_RANGE`, `_RANGE_SIZE` or `_MAX_ENUM`<sup>1</sup>.

1

The meaning of these special tokens is not exposed in the Vulkan Specification. They are not part of the API, and they **should** not be used by applications. Their original intended use was for internal consumption by Vulkan implementations. Even that use will no longer be supported in the future, but they will be retained for backwards compatibility reasons.

Any enumerated type returned from a query command or otherwise output from Vulkan to the application **must** not have a reserved value. Reserved values are values not defined by any extension for that enumerated type.

*Note*

This language is intended to accommodate cases such as “hidden” extensions known only to driver internals, or layers enabling extensions without knowledge of the application, without allowing return of values not defined by any extension.

## Valid Usage for Flags

A collection of flags is represented by a bitmask using the type `VkFlags`:

```
typedef uint32_t VkFlags;
```

Bitmasks are passed to many commands and structures to compactly represent options, but `VkFlags` is not used directly in the API. Instead, a `Vk*Flags` type which is an alias of `VkFlags`, and whose name matches the corresponding `Vk*FlagBits` that are valid for that type, is used.

Any `Vk*Flags` member or parameter used in the API as an input **must** be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags. A bit flag is valid if:

- The bit flag is defined as part of the `Vk*FlagBits` type, where the bits type is obtained by taking the flag type and replacing the trailing `Flags` with `FlagBits`. For example, a flag value of type `VkColorComponentFlags` **must** contain only bit flags defined by `VkColorComponentFlagBits`.
- The flag is allowed in the context in which it is being used. For example, in some cases, certain bit flags or combinations of bit flags are mutually exclusive.

Any `Vk*Flags` member or parameter returned from a query command or otherwise output from Vulkan to the application **may** contain bit flags undefined in its corresponding `Vk*FlagBits` type. An application **cannot** rely on the state of these unspecified bits.

## Valid Usage for Structure Types

Any parameter that is a structure containing a `sType` member **must** have a value of `sType` which is a valid `VkStructureType` value matching the type of the structure.

Structure types supported by the Vulkan API include:

```
typedef enum VkStructureType {
    VK_STRUCTURE_TYPE_APPLICATION_INFO = 0,
    VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO = 1,
    VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO = 2,
    VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO = 3,
    VK_STRUCTURE_TYPE_SUBMIT_INFO = 4,
    VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO = 5,
    VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE = 6,
    VK_STRUCTURE_TYPE_BIND_SPARSE_INFO = 7,
    VK_STRUCTURE_TYPE_FENCE_CREATE_INFO = 8,
    VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO = 9,

    VK_STRUCTURE_TYPE_MAX_ENUM = 0x7FFFFFFF
} VkStructureType;

```

Each value corresponds to a particular structure with a `sType` member with a matching name. As a general rule, the name of each `VkStructureType` value is obtained by taking the name of the structure, stripping the leading `Vk`, prefixing each capital letter with `_`, converting the entire resulting string to upper case, and prefixing it with `VK_STRUCTURE_TYPE_`. For example, structures of type `VkImageCreateInfo` correspond to a `VkStructureType` of `VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO`, and thus its `sType` member **must** equal that when it is passed to the API.

The values `VK_STRUCTURE_TYPE_LOADER_INSTANCE_CREATE_INFO` and `VK_STRUCTURE_TYPE_LOADER_DEVICE_CREATE_INFO` are reserved for internal use by the loader, and do not have corresponding Vulkan structures in this Specification.

## Valid Usage for Structure Pointer Chains

Any parameter that is a structure containing a `void* pNext` member **must** have a value of `pNext` that is either `NULL`, or is a pointer to a valid structure defined by an extension, containing `sType` and `pNext` members as described in the [Vulkan Documentation and Extensions](#) document in the section “Extension Interactions”. The set of structures connected by `pNext` pointers is referred to as a `pNext chain`. If that extension is supported by the implementation, then it **must** be enabled.

Each type of valid structure **must** not appear more than once in a `pNext` chain.

Any component of the implementation (the loader, any enabled layers, and drivers) **must** skip over,

without processing (other than reading the `sType` and `pNext` members) any structures in the chain with `sType` values not defined by extensions supported by that component.

Extension structures are not described in the base Vulkan Specification, but either in layered Specifications incorporating those extensions, or in separate vendor-provided documents.

As a convenience to implementations and layers needing to iterate through a structure pointer chain, the Vulkan API provides two *base structures*. These structures allow for some type safety, and can be used by Vulkan API functions that operate on generic inputs and outputs.

The `VkBaseInStructure` structure is defined as:

```
typedef struct VkBaseInStructure {
    VkStructureType           sType;
    const struct VkBaseInStructure* pNext;
} VkBaseInStructure;
```

- `sType` is the structure type of the structure being iterated through.
- `pNext` is `NULL` or a pointer to the next structure in a structure chain.

`VkBaseInStructure` can be used to facilitate iterating through a read-only structure pointer chain.

The `VkBaseOutStructure` structure is defined as:

```
typedef struct VkBaseOutStructure {
    VkStructureType           sType;
    struct VkBaseOutStructure* pNext;
} VkBaseOutStructure;
```

- `sType` is the structure type of the structure being iterated through.
- `pNext` is `NULL` or a pointer to the next structure in a structure chain.

`VkBaseOutStructure` can be used to facilitate iterating through a structure pointer chain that returns data back to the application.

## Valid Usage for Nested Structures

The above conditions also apply recursively to members of structures provided as input to a command, either as a direct argument to the command, or themselves a member of another structure.

Specifics on valid usage of each command are covered in their individual sections.

## Valid Usage for Extensions

Instance-level functionality or behavior added by an `instance extension` to the API **must** not be used unless that extension is supported by the instance as determined by `vkEnumerateInstanceExtensionProperties`, and that extension is enabled in `VkInstanceCreateInfo`.

Physical-device-level functionality or behavior added by an [instance extension](#) to the API **must** not be used unless that extension is supported by the instance as determined by [vkEnumerateInstanceExtensionProperties](#), and that extension is enabled in [VkInstanceCreateInfo](#).

Physical-device-level functionality or behavior added by a [device extension](#) to the API **must** not be used unless the conditions described in [Extending Physical Device Core Functionality](#) are met.

Device functionality or behavior added by a [device extension](#) to the API **must** not be used unless that extension is supported by the device as determined by [vkEnumerateDeviceExtensionProperties](#), and that extension is enabled in [VkDeviceCreateInfo](#).

### Valid Usage for Newer Core Versions

Instance-level functionality or behavior added by a [new core version](#) of the API **must** not be used unless it is supported by the instance as determined by [vkEnumerateInstanceVersion](#) and the specified version of [VkApplicationInfo::apiVersion](#).

Physical-device-level functionality or behavior added by a [new core version](#) of the API **must** not be used unless it is supported by the physical device as determined by [VkPhysicalDeviceProperties::apiVersion](#) and the specified version of [VkApplicationInfo::apiVersion](#).

Device-level functionality or behavior added by a [new core version](#) of the API **must** not be used unless it is supported by the device as determined by [VkPhysicalDeviceProperties::apiVersion](#) and the specified version of [VkApplicationInfo::apiVersion](#).

### 2.7.3. Return Codes

While the core Vulkan API is not designed to capture incorrect usage, some circumstances still require return codes. Commands in Vulkan return their status via return codes that are in one of two categories:

- Successful completion codes are returned when a command needs to communicate success or status information. All successful completion codes are non-negative values.
- Run time error codes are returned when a command needs to communicate a failure that could only be detected at run time. All run time error codes are negative values.

All return codes in Vulkan are reported via [VkResult](#) return values. The possible codes are:

```

typedef enum VkResult {
    VK_SUCCESS = 0,
    VK_NOT_READY = 1,
    VK_TIMEOUT = 2,
    VK_EVENT_SET = 3,
    VK_EVENT_RESET = 4,
    VK_INCOMPLETE = 5,
    VK_ERROR_OUT_OF_HOST_MEMORY = -1,
    VK_ERROR_OUT_OF_DEVICE_MEMORY = -2,
    VK_ERROR_INITIALIZATION_FAILED = -3,
    VK_ERROR_DEVICE_LOST = -4,
    VK_ERROR_MEMORY_MAP_FAILED = -5,
    VK_ERROR_LAYER_NOT_PRESENT = -6,
    VK_ERROR_EXTENSION_NOT_PRESENT = -7,
    VK_ERROR_FEATURE_NOT_PRESENT = -8,
    VK_ERROR_INCOMPATIBLE_DRIVER = -9,
    VK_ERROR_TOO_MANY_OBJECTS = -10,
    VK_ERROR_FORMAT_NOT_SUPPORTED = -11,
    VK_ERROR_FRAGMENTED_POOL = -12,
    VK_ERROR_OUT_OF_POOL_MEMORY = -1000069000,
    VK_ERROR_INVALID_EXTERNAL_HANDLE = -1000072003,
    VK_ERROR_SURFACE_LOST_KHR = -1000000000,
    VK_ERROR_NATIVE_WINDOW_IN_USE_KHR = -1000000001,
    VK_SUBOPTIMAL_KHR = 1000001003,
    VK_ERROR_OUT_OF_DATE_KHR = -1000001004,
    VK_ERROR_INCOMPATIBLE_DISPLAY_KHR = -1000003001,
    VK_ERROR_VALIDATION_FAILED_EXT = -1000011001,
    VK_ERROR_INVALID_SHADER_NV = -1000012000,
    VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT = -1000158000,
    VK_ERROR_FRAGMENTATION_EXT = -1000161000,
    VK_ERROR_NOT_PERMITTED_EXT = -1000174001,
    VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT = -1000255000,
    VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR = -1000244000,
    VK_ERROR_OUT_OF_POOL_MEMORY_KHR = VK_ERROR_OUT_OF_POOL_MEMORY,
    VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR = VK_ERROR_INVALID_EXTERNAL_HANDLE,
    VK_ERROR_INVALID_DEVICE_ADDRESS_EXT = VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR,
    VK_RESULT_MAX_ENUM = 0x7FFFFFFF
} VkResult;

```

### *Success Codes*

- **VK\_SUCCESS** Command successfully completed
- **VK\_NOT\_READY** A fence or query has not yet completed
- **VK\_TIMEOUT** A wait operation has not completed in the specified time
- **VK\_EVENT\_SET** An event is signaled
- **VK\_EVENT\_RESET** An event is unsignaled
- **VK\_INCOMPLETE** A return array was too small for the result

- **VK\_SUBOPTIMAL\_KHR** A swapchain no longer matches the surface properties exactly, but **can** still be used to present to the surface successfully.

#### Error codes

- **VK\_ERROR\_OUT\_OF\_HOST\_MEMORY** A host memory allocation has failed.
- **VK\_ERROR\_OUT\_OF\_DEVICE\_MEMORY** A device memory allocation has failed.
- **VK\_ERROR\_INITIALIZATION\_FAILED** Initialization of an object could not be completed for implementation-specific reasons.
- **VK\_ERROR\_DEVICE\_LOST** The logical or physical device has been lost. See [Lost Device](#)
- **VK\_ERROR\_MEMORY\_MAP\_FAILED** Mapping of a memory object has failed.
- **VK\_ERROR\_LAYER\_NOT\_PRESENT** A requested layer is not present or could not be loaded.
- **VK\_ERROR\_EXTENSION\_NOT\_PRESENT** A requested extension is not supported.
- **VK\_ERROR\_FEATURE\_NOT\_PRESENT** A requested feature is not supported.
- **VK\_ERROR\_INCOMPATIBLE\_DRIVER** The requested version of Vulkan is not supported by the driver or is otherwise incompatible for implementation-specific reasons.
- **VK\_ERROR\_TOO\_MANY\_OBJECTS** Too many objects of the type have already been created.
- **VK\_ERROR\_FORMAT\_NOT\_SUPPORTED** A requested format is not supported on this device.
- **VK\_ERROR\_FRAGMENTED\_POOL** A pool allocation has failed due to fragmentation of the pool's memory. This **must** only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. This **should** be returned in preference to **VK\_ERROR\_OUT\_OF\_POOL\_MEMORY**, but only if the implementation is certain that the pool allocation failure was due to fragmentation.
- **VK\_ERROR\_SURFACE\_LOST\_KHR** A surface is no longer available.
- **VK\_ERROR\_NATIVE\_WINDOW\_IN\_USE\_KHR** The requested window is already in use by Vulkan or another API in a manner which prevents it from being used again.
- **VK\_ERROR\_OUT\_OF\_DATE\_KHR** A surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications **must** query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.
- **VK\_ERROR\_INCOMPATIBLE\_DISPLAY\_KHR** The display used by a swapchain does not use the same presentable image layout, or is incompatible in a way that prevents sharing an image.
- **VK\_ERROR\_INVALID\_SHADER\_NV** One or more shaders failed to compile or link. More details are reported back to the application via [VK\\_EXT\\_debug\\_report](#) if enabled.
- **VK\_ERROR\_OUT\_OF\_POOL\_MEMORY** A pool memory allocation has failed. This **must** only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. If the failure was definitely due to fragmentation of the pool, **VK\_ERROR\_FRAGMENTED\_POOL** **should** be returned instead.
- **VK\_ERROR\_INVALID\_EXTERNAL\_HANDLE** An external handle is not a valid handle of the specified type.
- **VK\_ERROR\_FRAGMENTATION\_EXT** A descriptor pool creation has failed due to fragmentation.
- **VK\_ERROR\_INVALID\_DEVICE\_ADDRESS\_EXT** A buffer creation failed because the requested address is

not available.

- **VK\_ERROR\_INVALID\_OPAQUE\_CAPTURE\_ADDRESS\_KHR** A buffer creation or memory allocation failed because the requested address is not available.
- **VK\_ERROR\_FULL\_SCREEN\_EXCLUSIVE\_MODE\_LOST\_EXT** An operation on a swapchain created with **VK\_FULL\_SCREEN\_EXCLUSIVE\_APPLICATION\_CONTROLLED\_EXT** failed as it did not have exclusive full-screen access. This **may** occur due to implementation-dependent reasons, outside of the application's control.

If a command returns a run time error, unless otherwise specified any output parameters will have undefined contents, except that if the output parameter is a structure with **sType** and **pNext** fields, those fields will be unmodified. Any structures chained from **pNext** will also have undefined contents, except that **sType** and **pNext** will be unmodified.

Out of memory errors do not damage any currently existing Vulkan objects. Objects that have already been successfully created **can** still be used by the application.

Performance-critical commands generally do not have return codes. If a run time error occurs in such commands, the implementation will defer reporting the error until a specified point. For commands that record into command buffers (**vkCmd\***) run time errors are reported by **vkEndCommandBuffer**.

## 2.8. Numeric Representation and Computation

Implementations normally perform computations in floating-point, and **must** meet the range and precision requirements defined under “Floating-Point Computation” below.

These requirements only apply to computations performed in Vulkan operations outside of shader execution, such as texture image specification and sampling, and per-fragment operations. Range and precision requirements during shader execution differ and are specified by the [Precision and Operation of SPIR-V Instructions](#) section.

In some cases, the representation and/or precision of operations is implicitly limited by the specified format of vertex or texel data consumed by Vulkan. Specific floating-point formats are described later in this section.

### 2.8.1. Floating-Point Computation

Most floating-point computation is performed in SPIR-V shader modules. The properties of computation within shaders are constrained as defined by the [Precision and Operation of SPIR-V Instructions](#) section.

Some floating-point computation is performed outside of shaders, such as viewport and depth range calculations. For these computations, we do not specify how floating-point numbers are to be represented, or the details of how operations on them are performed, but only place minimal requirements on representation and precision as described in the remainder of this section.

We require simply that numbers' floating-point parts contain enough bits and that their exponent fields are large enough so that individual results of floating-point operations are accurate to about 1

part in  $10^5$ . The maximum representable magnitude for all floating-point values **must** be at least  $2^{32}$ .

$x \times 0 = 0 \times x = 0$  for any non-infinite and non-NaN  $x$ .

$1 \times x = x \times 1 = x$ .

$x + 0 = 0 + x = x$ .

$0^0 = 1$ .

Occasionally, further requirements will be specified. Most single-precision floating-point formats meet these requirements.

The special values Inf and -Inf encode values with magnitudes too large to be represented; the special value NaN encodes “Not A Number” values resulting from undefined arithmetic operations such as  $0 / 0$ . Implementations **may** support Inf and NaN in their floating-point computations.

## 2.8.2. Floating-Point Format Conversions

When a value is converted to a defined floating-point representation, finite values falling between two representable finite values are rounded to one or the other. The rounding mode is not defined. Finite values whose magnitude is larger than that of any representable finite value may be rounded either to the closest representable finite value or to the appropriately signed infinity. For unsigned destination formats any negative values are converted to zero. Positive infinity is converted to positive infinity; negative infinity is converted to negative infinity in signed formats and to zero in unsigned formats; and any NaN is converted to a NaN.

## 2.8.3. 16-Bit Floating-Point Numbers

16-bit floating point numbers are defined in the “16-bit floating point numbers” section of the [Khronos Data Format Specification](#).

## 2.8.4. Unsigned 11-Bit Floating-Point Numbers

Unsigned 11-bit floating point numbers are defined in the “Unsigned 11-bit floating point numbers” section of the [Khronos Data Format Specification](#).

## 2.8.5. Unsigned 10-Bit Floating-Point Numbers

Unsigned 10-bit floating point numbers are defined in the “Unsigned 10-bit floating point numbers” section of the [Khronos Data Format Specification](#).

## 2.8.6. General Requirements

Any representable floating-point value in the appropriate format is legal as input to a Vulkan command that requires floating-point data. The result of providing a value that is not a floating-point number to such a command is unspecified, but **must** not lead to Vulkan interruption or termination. For example, providing a negative zero (where applicable) or a denormalized number to an Vulkan command **must** yield deterministic results, while providing a NaN or Inf yields

unspecified results.

Some calculations require division. In such cases (including implied divisions performed by vector normalization), division by zero produces an unspecified result but **must** not lead to Vulkan interruption or termination.

## 2.9. Fixed-Point Data Conversions

When generic vertex attributes and pixel color or depth *components* are represented as integers, they are often (but not always) considered to be *normalized*. Normalized integer values are treated specially when being converted to and from floating-point values, and are usually referred to as *normalized fixed-point*.

In the remainder of this section,  $b$  denotes the bit width of the fixed-point integer representation. When the integer is one of the types defined by the API,  $b$  is the bit width of that type. When the integer comes from an [image](#) containing color or depth component texels,  $b$  is the number of bits allocated to that component in its [specified image format](#).

The signed and unsigned fixed-point representations are assumed to be  $b$ -bit binary two's-complement integers and binary unsigned integers, respectively.

### 2.9.1. Conversion from Normalized Fixed-Point to Floating-Point

Unsigned normalized fixed-point integers represent numbers in the range [0,1]. The conversion from an unsigned normalized fixed-point value  $c$  to the corresponding floating-point value  $f$  is defined as

$$f = \frac{c}{2^b - 1}$$

Signed normalized fixed-point integers represent numbers in the range [-1,1]. The conversion from a signed normalized fixed-point value  $c$  to the corresponding floating-point value  $f$  is performed using

$$f = \max\left(\frac{c}{2^{b-1} - 1}, -1.0\right)$$

Only the range  $[-2^{b-1} + 1, 2^{b-1} - 1]$  is used to represent signed fixed-point values in the range [-1,1]. For example, if  $b = 8$ , then the integer value -127 corresponds to -1.0 and the value 127 corresponds to 1.0. Note that while zero is exactly expressible in this representation, one value (-128 in the example) is outside the representable range, and **must** be clamped before use. This equation is used everywhere that signed normalized fixed-point values are converted to floating-point.

### 2.9.2. Conversion from Floating-Point to Normalized Fixed-Point

The conversion from a floating-point value  $f$  to the corresponding unsigned normalized fixed-point value  $c$  is defined by first clamping  $f$  to the range [0,1], then computing

$$c = \text{convertFloatToInt}(f \times (2^b - 1), b)$$

where `convertFloatToInt(r,b)` returns one of the two unsigned binary integer values with exactly

$b$  bits which are closest to the floating-point value  $r$ . Implementations **should** round to nearest. If  $r$  is equal to an integer, then that integer value **must** be returned. In particular, if  $f$  is equal to 0.0 or 1.0, then  $c$  **must** be assigned 0 or  $2^{b-1} - 1$ , respectively.

The conversion from a floating-point value  $f$  to the corresponding signed normalized fixed-point value  $c$  is performed by clamping  $f$  to the range [-1,1], then computing

$$c = \text{convertFloatToInt}(f \times (2^{b-1} - 1), b)$$

where `convertFloatToInt(r,b)` returns one of the two signed two's-complement binary integer values with exactly  $b$  bits which are closest to the floating-point value  $r$ . Implementations **should** round to nearest. If  $r$  is equal to an integer, then that integer value **must** be returned. In particular, if  $f$  is equal to -1.0, 0.0, or 1.0, then  $c$  **must** be assigned  $-(2^{b-1} - 1)$ , 0, or  $2^{b-1} - 1$ , respectively.

This equation is used everywhere that floating-point values are converted to signed normalized fixed-point.

## 2.10. Common Object Types

Some types of Vulkan objects are used in many different structures and command parameters, and are described here. These types include *offsets*, *extents*, and *rectangles*.

### 2.10.1. Offsets

Offsets are used to describe a pixel location within an image or framebuffer, as an (x,y) location for two-dimensional images, or an (x,y,z) location for three-dimensional images.

A two-dimensional offset is defined by the structure:

```
typedef struct VkOffset2D {
    int32_t    x;
    int32_t    y;
} VkOffset2D;
```

- $x$  is the x offset.
- $y$  is the y offset.

A three-dimensional offset is defined by the structure:

```
typedef struct VkOffset3D {
    int32_t    x;
    int32_t    y;
    int32_t    z;
} VkOffset3D;
```

- $x$  is the x offset.
- $y$  is the y offset.

- `z` is the z offset.

## 2.10.2. Extents

Extents are used to describe the size of a rectangular region of pixels within an image or framebuffer, as (width,height) for two-dimensional images, or as (width,height,depth) for three-dimensional images.

A two-dimensional extent is defined by the structure:

```
typedef struct VkExtent2D {
    uint32_t    width;
    uint32_t    height;
} VkExtent2D;
```

- `width` is the width of the extent.
- `height` is the height of the extent.

A three-dimensional extent is defined by the structure:

```
typedef struct VkExtent3D {
    uint32_t    width;
    uint32_t    height;
    uint32_t    depth;
} VkExtent3D;
```

- `width` is the width of the extent.
- `height` is the height of the extent.
- `depth` is the depth of the extent.

## 2.10.3. Rectangles

Rectangles are used to describe a specified rectangular region of pixels within an image or framebuffer. Rectangles include both an offset and an extent of the same dimensionality, as described above. Two-dimensional rectangles are defined by the structure

```
typedef struct VkRect2D {
    VkOffset2D    offset;
    VkExtent2D    extent;
} VkRect2D;
```

- `offset` is a `VkOffset2D` specifying the rectangle offset.
- `extent` is a `VkExtent2D` specifying the rectangle extent.

# Chapter 3. Initialization

Before using Vulkan, an application **must** initialize it by loading the Vulkan commands, and creating a `VkInstance` object.

## 3.1. Command Function Pointers

Vulkan commands are not necessarily exposed by static linking on a platform. Commands to query function pointers for Vulkan commands are described below.

### Note

When extensions are [promoted](#) or otherwise incorporated into another extension or Vulkan core version, command [aliases](#) may be included. Whilst the behavior of each command alias is identical, the behavior of retrieving each alias's function pointer is not. A function pointer for a given alias can only be retrieved if the extension or version that introduced that alias is supported and enabled, irrespective of whether any other alias is available.

Function pointers for all Vulkan commands **can** be obtained with the command:

```
PFN_vkVoidFunction vkGetInstanceProcAddr(  
    VkInstance instance,  
    const char* pName);
```

- `instance` is the instance that the function pointer will be compatible with, or `NULL` for commands not dependent on any instance.
- `pName` is the name of the command to obtain.

`vkGetInstanceProcAddr` itself is obtained in a platform- and loader- specific manner. Typically, the loader library will export this command as a function symbol, so applications **can** link against the loader library, or load it dynamically and look up the symbol using platform-specific APIs.

The table below defines the various use cases for `vkGetInstanceProcAddr` and expected return value (“fp” is “function pointer”) for each case.

The returned function pointer is of type `PFN_vkVoidFunction`, and must be cast to the type of the command being queried.

*Table 1. `vkGetInstanceProcAddr` behavior*

<code>instance</code>	<code>pName</code>	<b>return value</b>
<code>*<sup>1</sup></code>	<code>NULL</code>	<code>undefined</code>
invalid non- <code>NULL</code> instance	<code>*<sup>1</sup></code>	<code>undefined</code>
<code>NULL</code>	<code>vkEnumerateInstanceVersion</code>	<code>fp</code>

instance	pName	return value
NULL	<code>vkEnumerateInstanceExtensionProperties</code>	fp
NULL	<code>vkEnumerateInstanceLayerProperties</code>	fp
NULL	<code>vkCreateInstance</code>	fp
instance	core Vulkan command	$fp^2$
instance	enabled instance extension commands for <code>instance</code>	$fp^2$
instance	available device extension <sup>3</sup> commands for <code>instance</code>	$fp^2$
any other case, not covered above		NULL

1

"\*\*" means any representable value for the parameter (including valid values, invalid values, and `NULL`).

2

The returned function pointer **must** only be called with a dispatchable object (the first parameter) that is `instance` or a child of `instance`, e.g. `VkInstance`, `VkPhysicalDevice`, `VkDevice`, `VkQueue`, or `VkCommandBuffer`.

3

An "available device extension" is a device extension supported by any physical device enumerated by `instance`.

### Valid Usage (Implicit)

- If `instance` is not `NULL`, `instance` **must** be a valid `VkInstance` handle
- `pName` **must** be a null-terminated UTF-8 string

In order to support systems with multiple Vulkan implementations, the function pointers returned by `vkGetInstanceProcAddr` **may** point to dispatch code that calls a different real implementation for different `VkDevice` objects or their child objects. The overhead of the internal dispatch for `VkDevice` objects can be avoided by obtaining device-specific function pointers for any commands that use a device or device-child object as their dispatchable object. Such function pointers **can** be obtained with the command:

```
PFN_vkVoidFunction vkGetDeviceProcAddr(
    VkDevice                         device,
    const char*                      pName);
```

The table below defines the various use cases for `vkGetDeviceProcAddr` and expected return value for each case.

The returned function pointer is of type `PFN_vkVoidFunction`, and must be cast to the type of the command being queried. The function pointer **must** only be called with a dispatchable object (the first parameter) that is `device` or a child of `device`.

Table 2. `vkGetDeviceProcAddr` behavior

<code>device</code>	<code>pName</code>	return value
<code>NULL</code>	<code>*<sup>1</sup></code>	undefined
invalid device	<code>*<sup>1</sup></code>	undefined
<code>device</code>	<code>NULL</code>	undefined
<code>device</code>	core device-level Vulkan command	<code>fp<sup>2</sup></code>
<code>device</code>	enabled device extension device-level commands	<code>fp<sup>2</sup></code>
any other case, not covered above		<code>NULL</code>

1

"\*\*" means any representable value for the parameter (including valid values, invalid values, and `NULL`).

2

The returned function pointer **must** only be called with a dispatchable object (the first parameter) that is `device` or a child of `device` e.g. `VkDevice`, `VkQueue`, or `VkCommandBuffer`.

### Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pName` **must** be a null-terminated UTF-8 string

The definition of `PFN_vkVoidFunction` is:

```
typedef void (VKAPI_PTR *PFN_vkVoidFunction)(void);
```

### 3.1.1. Extending Physical Device Core Functionality

New core physical-device-level functionality **can** be used when the physical-device version is greater than or equal to the version of Vulkan that added the new functionality. The Vulkan version supported by a physical device **can** be obtained by calling `vkGetPhysicalDeviceProperties`.

### 3.1.2. Extending Physical Device From Device Extensions

When the `VK_KHR_get_physical_device_properties2` extension is enabled, or when both the instance

and the physical-device versions are at least 1.1, physical-device-level functionality of a device extension **can** be used with a physical device if the corresponding extension is enumerated by `vkEnumerateDeviceExtensionProperties` for that physical device, even before a logical device has been created.

To obtain a function pointer for a physical-device-level command from a device extension, an application **can** use `vkGetInstanceProcAddr`. This function pointer **may** point to dispatch code, which calls a different real implementation for different `VkPhysicalDevice` objects. Applications **must** not use a `VkPhysicalDevice` in any command added by an extension or core version that is not supported by that physical device.

Device extensions **may** define structures that **can** be added to the `pNext` chain of physical-device-level commands.

## 3.2. Instances

There is no global state in Vulkan and all per-application state is stored in a `VkInstance` object. Creating a `VkInstance` object initializes the Vulkan library and allows the application to pass information about itself to the implementation.

Instances are represented by `VkInstance` handles:

```
VK_DEFINE_HANDLE(VkInstance)
```

To query the version of instance-level functionality supported by the implementation, call:

```
VkResult vkEnumerateInstanceVersion(  
    uint32_t* pApiVersion);
```

- `pApiVersion` is a pointer to a `uint32_t`, which is the version of Vulkan supported by instance-level functionality, encoded as described in [Version Numbers](#).

### Valid Usage (Implicit)

- `pApiVersion` **must** be a valid pointer to a `uint32_t` value

### Return Codes

#### Success

- `VK_SUCCESS`

To create an instance object, call:

```
VkResult vkCreateInstance(
    const VkInstanceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkInstance* pInstance);
```

- `pCreateInfo` is a pointer to a `VkInstanceCreateInfo` structure controlling creation of the instance.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pInstance` points a `VkInstance` handle in which the resulting instance is returned.

`vkCreateInstance` verifies that the requested layers exist. If not, `vkCreateInstance` will return `VK_ERROR_LAYER_NOT_PRESENT`. Next `vkCreateInstance` verifies that the requested extensions are supported (e.g. in the implementation or in any enabled instance layer) and if any requested extension is not supported, `vkCreateInstance` **must** return `VK_ERROR_EXTENSION_NOT_PRESENT`. After verifying and enabling the instance layers and extensions the `VkInstance` object is created and returned to the application. If a requested extension is only supported by a layer, both the layer and the extension need to be specified at `vkCreateInstance` time for the creation to succeed.

## Valid Usage

- All required extensions for each extension in the `VkInstanceCreateInfo` `::ppEnabledExtensionNames` list **must** also be present in that list.

## Valid Usage (Implicit)

- `pCreateInfo` **must** be a valid pointer to a valid `VkInstanceCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pInstance` **must** be a valid pointer to a `VkInstance` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_LAYER_NOT_PRESENT`
- `VK_ERROR_EXTENSION_NOT_PRESENT`
- `VK_ERROR_INCOMPATIBLE_DRIVER`

The `VkInstanceCreateInfo` structure is defined as:

```
typedef struct VkInstanceCreateInfo {
    VkStructureType          sType;
    const void*               pNext;
    VkInstanceCreateFlags     flags;
    const VkApplicationInfo* pApplicationInfo;
    uint32_t                  enabledLayerCount;
    const char* const*        ppEnabledLayerNames;
    uint32_t                  enabledExtensionCount;
    const char* const*        ppEnabledExtensionNames;
} VkInstanceCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is reserved for future use.
- `pApplicationInfo` is `NULL` or a pointer to a `VkApplicationInfo` structure. If not `NULL`, this information helps implementations recognize behavior inherent to classes of applications. `VkApplicationInfo` is defined in detail below.
- `enabledLayerCount` is the number of global layers to enable.
- `ppEnabledLayerNames` is a pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings containing the names of layers to enable for the created instance. See the [Layers](#) section for further details.
- `enabledExtensionCount` is the number of global extensions to enable.
- `ppEnabledExtensionNames` is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDebugReportCallbackCreateInfoEXT`, `VkDebugUtilsMessengerCreateInfoEXT`, `VkValidationFeaturesEXT`, or `VkValidationFlagsEXT`
- Each `sType` member in the `pNext` chain must be unique
- `flags` must be `0`
- If `pApplicationInfo` is not `NULL`, `pApplicationInfo` must be a valid pointer to a valid `VkApplicationInfo` structure
- If `enabledLayerCount` is not `0`, `ppEnabledLayerNames` must be a valid pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings
- If `enabledExtensionCount` is not `0`, `ppEnabledExtensionNames` must be a valid pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings

```
typedef VkFlags VkInstanceCreateFlags;
```

`VkInstanceCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

When creating a Vulkan instance for which you wish to disable validation checks, add a `VkValidationFlagsEXT` structure to the `pNext` chain of the `VkInstanceCreateInfo` structure, specifying the checks to be disabled.

```
typedef struct VkValidationFlagsEXT {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 disabledValidationCheckCount;
    const VkValidationCheckEXT* pDisabledValidationChecks;
} VkValidationFlagsEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `disabledValidationCheckCount` is the number of checks to disable.
- `pDisabledValidationChecks` is a pointer to an array of `VkValidationCheckEXT` values specifying the validation checks to be disabled.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_VALIDATION_FLAGS_EXT`
- `pDisabledValidationChecks` must be a valid pointer to an array of `disabledValidationCheckCount` valid `VkValidationCheckEXT` values
- `disabledValidationCheckCount` must be greater than `0`

Possible values of elements of the `VkValidationFlagsEXT::pDisabledValidationChecks` array, specifying validation checks to be disabled, are:

```
typedef enum VkValidationCheckEXT {  
    VK_VALIDATION_CHECK_ALL_EXT = 0,  
    VK_VALIDATION_CHECK_SHADERS_EXT = 1,  
    VK_VALIDATION_CHECK_MAX_ENUM_EXT = 0x7FFFFFFF  
} VkValidationCheckEXT;
```

- `VK_VALIDATION_CHECK_ALL_EXT` specifies that all validation checks are disabled.
- `VK_VALIDATION_CHECK_SHADERS_EXT` specifies that shader validation is disabled.

When creating a Vulkan instance for which you wish to enable or disable specific validation features, add a `VkValidationFeaturesEXT` structure to the `pNext` chain of the `VkInstanceCreateInfo` structure, specifying the features to be enabled or disabled.

```
typedef struct VkValidationFeaturesEXT {  
    VkStructureType sType;  
    const void* pNext;  
    uint32_t enabledValidationFeatureCount;  
    const VkValidationFeatureEnableEXT* pEnabledValidationFeatures;  
    uint32_t disabledValidationFeatureCount;  
    const VkValidationFeatureDisableEXT* pDisabledValidationFeatures;  
} VkValidationFeaturesEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `enabledValidationFeatureCount` is the number of features to enable.
- `pEnabledValidationFeatures` is a pointer to an array of `VkValidationFeatureEnableEXT` values specifying the validation features to be enabled.
- `disabledValidationFeatureCount` is the number of features to disable.
- `pDisabledValidationFeatures` is a pointer to an array of `VkValidationFeatureDisableEXT` values specifying the validation features to be disabled.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_VALIDATION_FEATURES_EXT`
- If `enabledValidationFeatureCount` is not `0`, `pEnabledValidationFeatures` must be a valid pointer to an array of `enabledValidationFeatureCount` valid `VkValidationFeatureEnableEXT` values
- If `disabledValidationFeatureCount` is not `0`, `pDisabledValidationFeatures` must be a valid pointer to an array of `disabledValidationFeatureCount` valid `VkValidationFeatureDisableEXT` values

Possible values of elements of the `VkValidationFeaturesEXT::pEnabledValidationFeatures` array, specifying validation features to be enabled, are:

```
typedef enum VkValidationFeatureEnableEXT {
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT = 0,
    VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT = 1,
    VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT = 2,
    VK_VALIDATION_FEATURE_ENABLE_MAX_ENUM_EXT = 0x7FFFFFFF
} VkValidationFeatureEnableEXT;
```

- `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_EXT` specifies that GPU-assisted validation is enabled. Activating this feature instruments shader programs to generate additional diagnostic data. This feature is disabled by default.
- `VK_VALIDATION_FEATURE_ENABLE_GPU_ASSISTED_RESERVE_BINDING_SLOT_EXT` specifies that the validation layers reserve a descriptor set binding slot for their own use. The layer reports a value for `VkPhysicalDeviceLimits::maxBoundDescriptorSets` that is one less than the value reported by the device. If the device supports the binding of only one descriptor set, the validation layer does not perform GPU-assisted validation. This feature is disabled by default. The GPU-assisted validation feature must be enabled in order to use this feature.
- `VK_VALIDATION_FEATURE_ENABLE_BEST_PRACTICES_EXT` specifies that Vulkan best-practices validation is enabled. Activating this feature enables the output of warnings related to common misuse of the API, but which are not explicitly prohibited by the specification. This feature is disabled by default.

Possible values of elements of the `VkValidationFeaturesEXT::pDisabledValidationFeatures` array, specifying validation features to be disabled, are:

```

typedef enum VkValidationFeatureDisableEXT {
    VK_VALIDATION_FEATURE_DISABLE_ALL_EXT = 0,
    VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT = 1,
    VK_VALIDATION_FEATURE_DISABLE_THREAD_SAFETY_EXT = 2,
    VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT = 3,
    VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT = 4,
    VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT = 5,
    VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT = 6,
    VK_VALIDATION_FEATURE_DISABLE_MAX_ENUM_EXT = 0x7FFFFFFF
} VkValidationFeatureDisableEXT;

```

- `VK_VALIDATION_FEATURE_DISABLE_ALL_EXT` specifies that all validation checks are disabled.
- `VK_VALIDATION_FEATURE_DISABLE_SHADERS_EXT` specifies that shader validation is disabled. This feature is enabled by default.
- `VK_VALIDATION_FEATURE_DISABLE_THREAD_SAFETY_EXT` specifies that thread safety validation is disabled. This feature is enabled by default.
- `VK_VALIDATION_FEATURE_DISABLE_API_PARAMETERS_EXT` specifies that stateless parameter validation is disabled. This feature is enabled by default.
- `VK_VALIDATION_FEATURE_DISABLE_OBJECT_LIFETIMES_EXT` specifies that object lifetime validation is disabled. This feature is enabled by default.
- `VK_VALIDATION_FEATURE_DISABLE_CORE_CHECKS_EXT` specifies that core validation checks are disabled. This feature is enabled by default. If this feature is disabled, the shader validation and GPU-assisted validation features are also disabled.
- `VK_VALIDATION_FEATURE_DISABLE_UNIQUE_HANDLES_EXT` specifies that protection against duplicate non-dispatchable object handles is disabled. This feature is enabled by default.

*Note*

Disabling checks such as parameter validation and object lifetime validation prevents the reporting of error conditions that can cause other validation checks to behave incorrectly or crash. Some validation checks assume that their inputs are already valid and do not always revalidate them.

*Note*

The `VK_EXT_validation_features` extension subsumes all the functionality provided in the `VK_EXT_validation_flags` extension.

The `VkApplicationInfo` structure is defined as:

```
typedef struct VkApplicationInfo {
    VkStructureType sType;
    const void* pNext;
    const char* pApplicationName;
    uint32_t applicationVersion;
    const char* pEngineName;
    uint32_t engineVersion;
    uint32_t apiVersion;
} VkApplicationInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `pApplicationName` is `NULL` or is a pointer to a null-terminated UTF-8 string containing the name of the application.
- `applicationVersion` is an unsigned integer variable containing the developer-supplied version number of the application.
- `pEngineName` is `NULL` or is a pointer to a null-terminated UTF-8 string containing the name of the engine (if any) used to create the application.
- `engineVersion` is an unsigned integer variable containing the developer-supplied version number of the engine used to create the application.
- `apiVersion` **must** be the highest version of Vulkan that the application is designed to use, encoded as described in [Version Numbers](#). The patch version number specified in `apiVersion` is ignored when creating an instance object. Only the major and minor versions of the instance **must** match those requested in `apiVersion`.

Vulkan 1.0 implementations were required to return `VK_ERROR_INCOMPATIBLE_DRIVER` if `apiVersion` was larger than 1.0. Implementations that support Vulkan 1.1 or later **must** not return `VK_ERROR_INCOMPATIBLE_DRIVER` for any value of `apiVersion`.

*Note*

Because Vulkan 1.0 implementations **may** fail with `VK_ERROR_INCOMPATIBLE_DRIVER`, applications **should** determine the version of Vulkan available before calling `vkCreateInstance`. If the `vkGetInstanceProcAddr` returns `NULL` for `vkEnumerateInstanceVersion`, it is a Vulkan 1.0 implementation. Otherwise, the application **can** call `vkEnumerateInstanceVersion` to determine the version of Vulkan.

As long as the instance supports at least Vulkan 1.1, an application **can** use different versions of Vulkan with an instance than it does with a device or physical device.

*Note*

The Khronos validation layers will treat `apiVersion` as the highest API version the application targets, and will validate API usage against the minimum of that version and the implementation version (instance or device, depending on context). If an application tries to use functionality from a greater version than this, a validation error will be triggered.

For example, if the instance supports Vulkan 1.1 and three physical devices support Vulkan 1.0, Vulkan 1.1, and a hypothetical Vulkan 1.2, respectively, and if the application sets `apiVersion` to 1.2, the application **can** use the following versions of Vulkan:

- Vulkan 1.0 **can** be used with the instance and with all physical devices.
- Vulkan 1.1 **can** be used with the instance and with the physical devices that support Vulkan 1.1 and Vulkan 1.2.
- Vulkan 1.2 **can** be used with the physical device that supports Vulkan 1.2.

If we modify the above example so that the application sets `apiVersion` to 1.1, then the application **must** not use Vulkan 1.2 functionality on the physical device that supports Vulkan 1.2.

Implicit layers **must** be disabled if they do not support a version at least as high as `apiVersion`. See the [Vulkan Loader Specification and Architecture Overview](#) document for additional information.

*Note*

Providing a `NULL` `VkInstanceCreateInfo::pApplicationInfo` or providing an `apiVersion` of 0 is equivalent to providing an `apiVersion` of `VK_MAKE_VERSION(1,0,0)`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_APPLICATION_INFO`
- `pNext` **must** be `NULL`
- If `pApplicationName` is not `NULL`, `pApplicationName` **must** be a null-terminated UTF-8 string
- If `pEngineName` is not `NULL`, `pEngineName` **must** be a null-terminated UTF-8 string

To destroy an instance, call:

```
void vkDestroyInstance(  
    VkInstance  
    const VkAllocationCallbacks*  
                                instance,  
                                pAllocator);
```

- `instance` is the handle of the instance to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- All child objects created using `instance` **must** have been destroyed prior to destroying `instance`
- If `VkAllocationCallbacks` were provided when `instance` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `instance` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- If `instance` is not `NULL`, `instance` **must** be a valid `VkInstance` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

## Host Synchronization

- Host access to `instance` **must** be externally synchronized

# Chapter 4. Devices and Queues

Once Vulkan is initialized, devices and queues are the primary objects used to interact with a Vulkan implementation.

Vulkan separates the concept of *physical* and *logical* devices. A physical device usually represents a single complete implementation of Vulkan (excluding instance-level functionality) available to the host, of which there are a finite number. A logical device represents an instance of that implementation with its own state and resources independent of other logical devices.

Physical devices are represented by `VkPhysicalDevice` handles:

```
VK_DEFINE_HANDLE(VkPhysicalDevice)
```

## 4.1. Physical Devices

To retrieve a list of physical device objects representing the physical devices installed in the system, call:

```
VkResult vkEnumeratePhysicalDevices(  
    VkInstance  
    uint32_t*  
    VkPhysicalDevice*  
        instance,  
        pPhysicalDeviceCount,  
        pPhysicalDevices);
```

- `instance` is a handle to a Vulkan instance previously created with `vkCreateInstance`.
- `pPhysicalDeviceCount` is a pointer to an integer related to the number of physical devices available or queried, as described below.
- `pPhysicalDevices` is either `NULL` or a pointer to an array of `VkPhysicalDevice` handles.

If `pPhysicalDevices` is `NULL`, then the number of physical devices available is returned in `pPhysicalDeviceCount`. Otherwise, `pPhysicalDeviceCount` **must** point to a variable set by the user to the number of elements in the `pPhysicalDevices` array, and on return the variable is overwritten with the number of handles actually written to `pPhysicalDevices`. If `pPhysicalDeviceCount` is less than the number of physical devices available, at most `pPhysicalDeviceCount` structures will be written. If `pPhysicalDeviceCount` is smaller than the number of physical devices available, `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available physical devices were returned.

## Valid Usage (Implicit)

- `instance` **must** be a valid `VkInstance` handle
- `pPhysicalDeviceCount` **must** be a valid pointer to a `uint32_t` value
- If the value referenced by `pPhysicalDeviceCount` is not `0`, and `pPhysicalDevices` is not `NULL`, `pPhysicalDevices` **must** be a valid pointer to an array of `pPhysicalDeviceCount` `VkPhysicalDevice` handles

## Return Codes

### Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

To query general properties of physical devices once enumerated, call:

```
void vkGetPhysicalDeviceProperties(  
    VkPhysicalDevice                physicalDevice,  
    VkPhysicalDeviceProperties*    pProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pProperties` is a pointer to a `VkPhysicalDeviceProperties` structure in which properties are returned.

## Valid Usage (Implicit)

- `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- `pProperties` **must** be a valid pointer to a `VkPhysicalDeviceProperties` structure

The `VkPhysicalDeviceProperties` structure is defined as:

```

typedef struct VkPhysicalDeviceProperties {
    uint32_t                                apiVersion;
    uint32_t                                driverVersion;
    uint32_t                                vendorID;
    uint32_t                                deviceID;
    VkPhysicalDeviceType                     deviceType;
    char                                     deviceName[VK_MAX_PHYSICAL_DEVICE_NAME_SIZE];
    uint8_t                                  pipelineCacheUUID[VK_UUID_SIZE];
    VkPhysicalDeviceLimits                  limits;
    VkPhysicalDeviceSparseProperties        sparseProperties;
} VkPhysicalDeviceProperties;

```

- **apiVersion** is the version of Vulkan supported by the device, encoded as described in [Version Numbers](#).
- **driverVersion** is the vendor-specified version of the driver.
- **vendorID** is a unique identifier for the *vendor* (see below) of the physical device.
- **deviceID** is a unique identifier for the physical device among devices available from the vendor.
- **deviceType** is a [VkPhysicalDeviceType](#) specifying the type of device.
- **deviceName** is an array of [VK\\_MAX\\_PHYSICAL\\_DEVICE\\_NAME\\_SIZE](#) **char** containing a null-terminated UTF-8 string which is the name of the device.
- **pipelineCacheUUID** is an array of [VK\\_UUID\\_SIZE](#) **uint8\_t** values representing a universally unique identifier for the device.
- **limits** is the [VkPhysicalDeviceLimits](#) structure specifying device-specific limits of the physical device. See [Limits](#) for details.
- **sparseProperties** is the [VkPhysicalDeviceSparseProperties](#) structure specifying various sparse related properties of the physical device. See [Sparse Properties](#) for details.

*Note*

The value of **apiVersion** **may** be different than the version returned by [vkEnumerateInstanceVersion](#); either higher or lower. In such cases, the application **must** not use functionality that exceeds the version of Vulkan associated with a given object. The **pApiVersion** parameter returned by [vkEnumerateInstanceVersion](#) is the version associated with a [VkInstance](#) and its children, except for a [VkPhysicalDevice](#) and its children. **VkPhysicalDeviceProperties::apiVersion** is the version associated with a [VkPhysicalDevice](#) and its children.

The **vendorID** and **deviceID** fields are provided to allow applications to adapt to device characteristics that are not adequately exposed by other Vulkan queries.

*Note*

These **may** include performance profiles, hardware errata, or other characteristics.

The *vendor* identified by `vendorID` is the entity responsible for the most salient characteristics of the underlying implementation of the `VkPhysicalDevice` being queried.

*Note*

For example, in the case of a discrete GPU implementation, this **should** be the GPU chipset vendor. In the case of a hardware accelerator integrated into a system-on-chip (SoC), this **should** be the supplier of the silicon IP used to create the accelerator.

If the vendor has a [PCI vendor ID](#), the low 16 bits of `vendorID` **must** contain that PCI vendor ID, and the remaining bits **must** be set to zero. Otherwise, the value returned **must** be a valid Khronos vendor ID, obtained as described in the [Vulkan Documentation and Extensions: Procedures and Conventions](#) document in the section “Registering a Vendor ID with Khronos”. Khronos vendor IDs are allocated starting at 0x10000, to distinguish them from the PCI vendor ID namespace. Khronos vendor IDs are symbolically defined in the `VkVendorId` type.

The vendor is also responsible for the value returned in `deviceID`. If the implementation is driven primarily by a [PCI device](#) with a [PCI device ID](#), the low 16 bits of `deviceID` **must** contain that PCI device ID, and the remaining bits **must** be set to zero. Otherwise, the choice of what values to return **may** be dictated by operating system or platform policies - but **should** uniquely identify both the device version and any major configuration options (for example, core count in the case of multicore devices).

*Note*

The same device ID **should** be used for all physical implementations of that device version and configuration. For example, all uses of a specific silicon IP GPU version and configuration **should** use the same device ID, even if those uses occur in different SoCs.

Khronos vendor IDs which **may** be returned in `VkPhysicalDeviceProperties::vendorID` are:

```
typedef enum VkVendorId {
    VK_VENDOR_ID_VIV = 0x10001,
    VK_VENDOR_ID_VSI = 0x10002,
    VK_VENDOR_ID_KAZAN = 0x10003,
    VK_VENDOR_ID_MAX_ENUM = 0x7FFFFFFF
} VkVendorId;
```

*Note*

Khronos vendor IDs may be allocated by vendors at any time. Only the latest canonical versions of this Specification, of the corresponding `vk.xml` API Registry, and of the corresponding `vulkan_core.h` header file **must** contain all reserved Khronos vendor IDs.

Only Khronos vendor IDs are given symbolic names at present. PCI vendor IDs returned by the implementation can be looked up in the PCI-SIG database.

The physical device types which **may** be returned in `VkPhysicalDeviceProperties::deviceType` are:

```
typedef enum VkPhysicalDeviceType {
    VK_PHYSICAL_DEVICE_TYPE_OTHER = 0,
    VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU = 1,
    VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU = 2,
    VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU = 3,
    VK_PHYSICAL_DEVICE_TYPE_CPU = 4,
    VK_PHYSICAL_DEVICE_TYPE_MAX_ENUM = 0x7FFFFFFF
} VkPhysicalDeviceType;
```

- `VK_PHYSICAL_DEVICE_TYPE_OTHER` - the device does not match any other available types.
- `VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU` - the device is typically one embedded in or tightly coupled with the host.
- `VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU` - the device is typically a separate processor connected to the host via an interlink.
- `VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU` - the device is typically a virtual node in a virtualization environment.
- `VK_PHYSICAL_DEVICE_TYPE_CPU` - the device is typically running on the same processors as the host.

The physical device type is advertised for informational purposes only, and does not directly affect the operation of the system. However, the device type **may** correlate with other advertised properties or capabilities of the system, such as how many memory heaps there are.

To query general properties of physical devices once enumerated, call:

```
void vkGetPhysicalDeviceProperties2(
    VkPhysicalDevice                      physicalDevice,
    VkPhysicalDeviceProperties2*          pProperties);
```

or the equivalent command

```
void vkGetPhysicalDeviceProperties2KHR(
    VkPhysicalDevice                      physicalDevice,
    VkPhysicalDeviceProperties2*          pProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pProperties` is a pointer to a `VkPhysicalDeviceProperties2` structure in which properties are returned.

Each structure in `pProperties` and its `pNext` chain contain members corresponding to properties or implementation-dependent limits. `vkGetPhysicalDeviceProperties2` writes each member to a value indicating the value of that property or limit.

## Valid Usage (Implicit)

- `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- `pProperties` **must** be a valid pointer to a `VkPhysicalDeviceProperties2` structure

The `VkPhysicalDeviceProperties2` structure is defined as:

```
typedef struct VkPhysicalDeviceProperties2 {  
    VkStructureType          sType;  
    void*                   pNext;  
    VkPhysicalDeviceProperties properties;  
} VkPhysicalDeviceProperties2;
```

or the equivalent

```
typedef VkPhysicalDeviceProperties2 VkPhysicalDeviceProperties2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `properties` is a `VkPhysicalDeviceProperties` structure describing properties of the physical device. This structure is written with the same values as if it were written by `vkGetPhysicalDeviceProperties`.

The `pNext` chain of this structure is used to extend the structure with properties defined by extensions.

## Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROPERTIES_2`
- Each **pNext** member of any structure (including this one) in the **pNext** chain must be either `NULL` or a pointer to a valid instance of `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT`, `VkPhysicalDeviceConservativeRasterizationPropertiesEXT`, `VkPhysicalDeviceCooperativeMatrixPropertiesNV`, `VkPhysicalDeviceDepthStencilResolvePropertiesKHR`, `VkPhysicalDeviceDescriptorIndexingPropertiesEXT`, `VkPhysicalDeviceDiscardRectanglePropertiesEXT`, `VkPhysicalDeviceDriverPropertiesKHR`, `VkPhysicalDeviceExternalMemoryHostPropertiesEXT`, `VkPhysicalDeviceFloatControlsPropertiesKHR`, `VkPhysicalDeviceFragmentDensityMapPropertiesEXT`, `VkPhysicalDeviceIDProperties`, `VkPhysicalDeviceInlineUniformBlockPropertiesEXT`, `VkPhysicalDeviceLineRasterizationPropertiesEXT`, `VkPhysicalDeviceMaintenance3Properties`, `VkPhysicalDeviceMeshShaderPropertiesNV`, `VkPhysicalDeviceMultiviewPerViewAttributesPropertiesNVX`, `VkPhysicalDeviceMultiviewProperties`, `VkPhysicalDevicePCIBusInfoPropertiesEXT`, `VkPhysicalDevicePerformanceQueryPropertiesKHR`, `VkPhysicalDevicePointClippingProperties`, `VkPhysicalDeviceProtectedMemoryProperties`, `VkPhysicalDevicePushDescriptorPropertiesKHR`, `VkPhysicalDeviceRayTracingPropertiesNV`, `VkPhysicalDeviceSampleLocationsPropertiesEXT`, `VkPhysicalDeviceSamplerFilterMinmaxPropertiesEXT`, `VkPhysicalDeviceShaderCoreProperties2AMD`, `VkPhysicalDeviceShaderCorePropertiesAMD`, `VkPhysicalDeviceShaderSMBuiltinsPropertiesNV`, `VkPhysicalDeviceShadingRateImagePropertiesNV`, `VkPhysicalDeviceSubgroupProperties`, `VkPhysicalDeviceSubgroupSizeControlPropertiesEXT`, `VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT`, `VkPhysicalDeviceTimelineSemaphorePropertiesKHR`, `VkPhysicalDeviceTransformFeedbackPropertiesEXT`, `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT` or
- Each **sType** member in the **pNext** chain must be unique

To query the UUID and LUID of a device, add `VkPhysicalDeviceIDProperties` to the **pNext** chain of the `VkPhysicalDeviceProperties2` structure. The `VkPhysicalDeviceIDProperties` structure is defined as:

```

typedef struct VkPhysicalDeviceIDProperties {
    VkStructureType sType;
    void* pNext;
    uint8_t deviceUUID[VK_UUID_SIZE];
    uint8_t driverUUID[VK_UUID_SIZE];
    uint8_t deviceLUID[VK_LUID_SIZE];
    uint32_t deviceNodeMask;
    VkBool32 deviceLUIDValid;
} VkPhysicalDeviceIDProperties;

```

or the equivalent

```
typedef VkPhysicalDeviceIDProperties VkPhysicalDeviceIDPropertiesKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **deviceUUID** is an array of **VK\_UUID\_SIZE** **uint8\_t** values representing a universally unique identifier for the device.
- **driverUUID** is an array of **VK\_UUID\_SIZE** **uint8\_t** values representing a universally unique identifier for the driver build in use by the device.
- **deviceLUID** is an array of **VK\_LUID\_SIZE** **uint8\_t** values representing a locally unique identifier for the device.
- **deviceNodeMask** is a **uint32\_t** bitfield identifying the node within a linked device adapter corresponding to the device.
- **deviceLUIDValid** is a boolean value that will be **VK\_TRUE** if **deviceLUID** contains a valid LUID and **deviceNodeMask** contains a valid node mask, and **VK\_FALSE** if they do not.

**deviceUUID** **must** be immutable for a given device across instances, processes, driver APIs, driver versions, and system reboots.

Applications **can** compare the **driverUUID** value across instance and process boundaries, and **can** make similar queries in external APIs to determine whether they are capable of sharing memory objects and resources using them with the device.

**deviceUUID** and/or **driverUUID** **must** be used to determine whether a particular external object can be shared between driver components, where such a restriction exists as defined in the compatibility table for the particular object type:

- [External memory handle types compatibility](#)
- [External semaphore handle types compatibility](#)
- [External fence handle types compatibility](#)

If **deviceLUIDValid** is **VK\_FALSE**, the values of **deviceLUID** and **deviceNodeMask** are undefined. If **deviceLUIDValid** is **VK\_TRUE** and Vulkan is running on the Windows operating system, the contents of

`deviceLUID` can be cast to an `LUID` object and **must** be equal to the locally unique identifier of a `IDXGIAdapter1` object that corresponds to `physicalDevice`. If `deviceLUIDValid` is `VK_TRUE`, `deviceNodeMask` **must** contain exactly one bit. If Vulkan is running on an operating system that supports the Direct3D 12 API and `physicalDevice` corresponds to an individual device in a linked device adapter, `deviceNodeMask` identifies the Direct3D 12 node corresponding to `physicalDevice`. Otherwise, `deviceNodeMask` **must** be 1.

*Note*

Although they have identical descriptions, `VkPhysicalDeviceIDProperties::deviceUUID` may differ from `VkPhysicalDeviceProperties2::pipelineCacheUUID`. The former is intended to identify and correlate devices across API and driver boundaries, while the latter is used to identify a compatible device and driver combination to use when serializing and de-serializing pipeline state.

*Note*

While `VkPhysicalDeviceIDProperties::deviceUUID` is specified to remain consistent across driver versions and system reboots, it is not intended to be usable as a serializable persistent identifier for a device. It may change when a device is physically added to, removed from, or moved to a different connector in a system while that system is powered down. Further, there is no reasonable way to verify with conformance testing that a given device retains the same UUID in a given system across all driver versions supported in that system. While implementations should make every effort to report consistent device UUIDs across driver versions, applications should avoid relying on the persistence of this value for uses other than identifying compatible devices for external object sharing purposes.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ID_PROPERTIES`

To query the properties of the driver corresponding to a physical device, add `VkPhysicalDeviceDriverPropertiesKHR` to the `pNext` chain of the `VkPhysicalDeviceProperties2` structure. The `VkPhysicalDeviceDriverPropertiesKHR` structure is defined as:

```
typedef struct VkPhysicalDeviceDriverPropertiesKHR {
    VkStructureType           sType;
    void*                     pNext;
    VkDriverIdKHR             driverID;
    char                      driverName[VK_MAX_DRIVER_NAME_SIZE_KHR];
    char                      driverInfo[VK_MAX_DRIVER_INFO_SIZE_KHR];
    VkConformanceVersionKHR   conformanceVersion;
} VkPhysicalDeviceDriverPropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension specific structure.

- `driverID` is a unique identifier for the driver of the physical device.
- `driverName` is an array of `VK_MAX_DRIVER_NAME_SIZE_KHR` `char` containing a null-terminated UTF-8 string which is the name of the driver.
- `driverInfo` is an array of `VK_MAX_DRIVER_INFO_SIZE_KHR` `char` containing a null-terminated UTF-8 string with additional information about the driver.
- `conformanceVersion` is the version of the Vulkan conformance test this driver is conformant against (see [VkConformanceVersionKHR](#)).

`driverID` **must** be immutable for a given driver across instances, processes, driver versions, and system reboots.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DRIVER_PROPERTIES_KHR`

Khronos driver IDs which **may** be returned in [VkPhysicalDeviceDriverPropertiesKHR::driverID](#) are:

```
typedef enum VkDriverIdKHR {
    VK_DRIVER_ID_AMD_PROPRIETARY_KHR = 1,
    VK_DRIVER_ID_AMD_OPEN_SOURCE_KHR = 2,
    VK_DRIVER_ID_MESA_RADV_KHR = 3,
    VK_DRIVER_ID_NVIDIA_PROPRIETARY_KHR = 4,
    VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS_KHR = 5,
    VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA_KHR = 6,
    VK_DRIVER_ID_IMAGINATION_PROPRIETARY_KHR = 7,
    VK_DRIVER_ID_QUALCOMM_PROPRIETARY_KHR = 8,
    VK_DRIVER_ID_ARM_PROPRIETARY_KHR = 9,
    VK_DRIVER_ID_GOOGLE_SWIFTSHADER_KHR = 10,
    VK_DRIVER_ID_GGP_PROPRIETARY_KHR = 11,
    VK_DRIVER_ID_BROADCOM_PROPRIETARY_KHR = 12,
    VK_DRIVER_ID_MAX_ENUM_KHR = 0x7FFFFFFF
} VkDriverIdKHR;
```

### Note

Khronos driver IDs may be allocated by vendors at any time. There may be multiple driver IDs for the same vendor, representing different drivers (for e.g. different platforms, proprietary or open source, etc.). Only the latest canonical versions of this Specification, of the corresponding `vk.xml` API Registry, and of the corresponding `vulkan_core.h` header file **must** contain all reserved Khronos driver IDs.

Only driver IDs registered with Khronos are given symbolic names. There **may** be unregistered driver IDs returned.

The conformance test suite version an implementation is compliant with is described with an instance of the `VkConformanceVersionKHR` structure. The `VkConformanceVersionKHR` structure is defined

as:

```
typedef struct VkConformanceVersionKHR {
    uint8_t    major;
    uint8_t    minor;
    uint8_t    subminor;
    uint8_t    patch;
} VkConformanceVersionKHR;
```

- **major** is the major version number of the conformance test suite.
- **minor** is the minor version number of the conformance test suite.
- **subminor** is the subminor version number of the conformance test suite.
- **patch** is the patch version number of the conformance test suite.

To query the PCI bus information of a physical device, add [VkPhysicalDevicePCIBusInfoPropertiesEXT](#) to the **pNext** chain of the [VkPhysicalDeviceProperties2](#) structure. The [VkPhysicalDevicePCIBusInfoPropertiesEXT](#) structure is defined as:

```
typedef struct VkPhysicalDevicePCIBusInfoPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t            pciDomain;
    uint32_t            pciBus;
    uint32_t            pciDevice;
    uint32_t            pciFunction;
} VkPhysicalDevicePCIBusInfoPropertiesEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **pciDomain** is the PCI bus domain.
- **pciBus** is the PCI bus identifier.
- **pciDevice** is the PCI device identifier.
- **pciFunction** is the PCI device function identifier.

## Valid Usage (Implicit)

- **sType** must be **VK\_STRUCTURE\_TYPE\_PHYSICAL\_DEVICE\_PCI\_BUS\_INFO\_PROPERTIES\_EXT**

To query properties of queues available on a physical device, call:

```
void vkGetPhysicalDeviceQueueFamilyProperties(
    VkPhysicalDevice physicalDevice,
    uint32_t* pQueueFamilyPropertyCount,
    VkQueueFamilyProperties* pQueueFamilyProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pQueueFamilyPropertyCount` is a pointer to an integer related to the number of queue families available or queried, as described below.
- `pQueueFamilyProperties` is either `NULL` or a pointer to an array of `VkQueueFamilyProperties` structures.

If `pQueueFamilyProperties` is `NULL`, then the number of queue families available is returned in `pQueueFamilyPropertyCount`. Implementations **must** support at least one queue family. Otherwise, `pQueueFamilyPropertyCount` **must** point to a variable set by the user to the number of elements in the `pQueueFamilyProperties` array, and on return the variable is overwritten with the number of structures actually written to `pQueueFamilyProperties`. If `pQueueFamilyPropertyCount` is less than the number of queue families available, at most `pQueueFamilyPropertyCount` structures will be written.

## Valid Usage (Implicit)

- `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- `pQueueFamilyPropertyCount` **must** be a valid pointer to a `uint32_t` value
- If the value referenced by `pQueueFamilyPropertyCount` is not `0`, and `pQueueFamilyProperties` is not `NULL`, `pQueueFamilyProperties` **must** be a valid pointer to an array of `pQueueFamilyPropertyCount` `VkQueueFamilyProperties` structures

The `VkQueueFamilyProperties` structure is defined as:

```
typedef struct VkQueueFamilyProperties {
    VkQueueFlags    queueFlags;
    uint32_t        queueCount;
    uint32_t        timestampValidBits;
    VkExtent3D      minImageTransferGranularity;
} VkQueueFamilyProperties;
```

- `queueFlags` is a bitmask of `VkQueueFlagBits` indicating capabilities of the queues in this queue family.
- `queueCount` is the unsigned integer count of queues in this queue family. Each queue family **must** support at least one queue.
- `timestampValidBits` is the unsigned integer count of meaningful bits in the timestamps written via `vkCmdWriteTimestamp`. The valid range for the count is 36..64 bits, or a value of 0, indicating no support for timestamps. Bits outside the valid range are guaranteed to be zeros.
- `minImageTransferGranularity` is the minimum granularity supported for image transfer

operations on the queues in this queue family.

The value returned in `minImageTransferGranularity` has a unit of compressed texel blocks for images having a block-compressed format, and a unit of texels otherwise.

Possible values of `minImageTransferGranularity` are:

- (0,0,0) which indicates that only whole mip levels **must** be transferred using the image transfer operations on the corresponding queues. In this case, the following restrictions apply to all offset and extent parameters of image transfer operations:
  - The `x`, `y`, and `z` members of a `VkOffset3D` parameter **must** always be zero.
  - The `width`, `height`, and `depth` members of a `VkExtent3D` parameter **must** always match the width, height, and depth of the image subresource corresponding to the parameter, respectively.
- ( $A_x$ ,  $A_y$ ,  $A_z$ ) where  $A_x$ ,  $A_y$ , and  $A_z$  are all integer powers of two. In this case the following restrictions apply to all image transfer operations:
  - `x`, `y`, and `z` of a `VkOffset3D` parameter **must** be integer multiples of  $A_x$ ,  $A_y$ , and  $A_z$ , respectively.
  - `width` of a `VkExtent3D` parameter **must** be an integer multiple of  $A_x$ , or else `x + width` **must** equal the width of the image subresource corresponding to the parameter.
  - `height` of a `VkExtent3D` parameter **must** be an integer multiple of  $A_y$ , or else `y + height` **must** equal the height of the image subresource corresponding to the parameter.
  - `depth` of a `VkExtent3D` parameter **must** be an integer multiple of  $A_z$ , or else `z + depth` **must** equal the depth of the image subresource corresponding to the parameter.
  - If the format of the image corresponding to the parameters is one of the block-compressed formats then for the purposes of the above calculations the granularity **must** be scaled up by the compressed texel block dimensions.

Queues supporting graphics and/or compute operations **must** report (1,1,1) in `minImageTransferGranularity`, meaning that there are no additional restrictions on the granularity of image transfer operations for these queues. Other queues supporting image transfer operations are only **required** to support whole mip level transfers, thus `minImageTransferGranularity` for queues belonging to such queue families **may** be (0,0,0).

The [Device Memory](#) section describes memory properties queried from the physical device.

For physical device feature queries see the [Features](#) chapter.

Bits which **may** be set in `VkQueueFamilyProperties::queueFlags` indicating capabilities of queues in a queue family are:

```
typedef enum VkQueueFlagBits {
    VK_QUEUE_GRAPHICS_BIT = 0x00000001,
    VK_QUEUE_COMPUTE_BIT = 0x00000002,
    VK_QUEUE_TRANSFER_BIT = 0x00000004,
    VK_QUEUE_SPARSE_BINDING_BIT = 0x00000008,
    VK_QUEUE_PROTECTED_BIT = 0x00000010,
    VK_QUEUE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkQueueFlagBits;
```

- `VK_QUEUE_GRAPHICS_BIT` specifies that queues in this queue family support graphics operations.
- `VK_QUEUE_COMPUTE_BIT` specifies that queues in this queue family support compute operations.
- `VK_QUEUE_TRANSFER_BIT` specifies that queues in this queue family support transfer operations.
- `VK_QUEUE_SPARSE_BINDING_BIT` specifies that queues in this queue family support sparse memory management operations (see [Sparse Resources](#)). If any of the sparse resource features are enabled, then at least one queue family **must** support this bit.
- if `VK_QUEUE_PROTECTED_BIT` is set, then the queues in this queue family support the `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT` bit. (see [Protected Memory](#)). If the protected memory physical device feature is supported, then at least one queue family of at least one physical device exposed by the implementation **must** support this bit.

If an implementation exposes any queue family that supports graphics operations, at least one queue family of at least one physical device exposed by the implementation **must** support both graphics and compute operations.

Furthermore, if the protected memory physical device feature is supported, then at least one queue family of at least one physical device exposed by the implementation **must** support graphics operations, compute operations, and protected memory operations.

*Note*

All commands that are allowed on a queue that supports transfer operations are also allowed on a queue that supports either graphics or compute operations. Thus, if the capabilities of a queue family include `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, then reporting the `VK_QUEUE_TRANSFER_BIT` capability separately for that queue family is **optional**.

For further details see [Queues](#).

```
typedef VkFlags VkQueueFlags;
```

`VkQueueFlags` is a bitmask type for setting a mask of zero or more `VkQueueFlagBits`.

To query properties of queues available on a physical device, call:

```
void vkGetPhysicalDeviceQueueFamilyProperties2(
    VkPhysicalDevice                          physicalDevice,
    uint32_t*                                 pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2*                  pQueueFamilyProperties);
```

or the equivalent command

```
void vkGetPhysicalDeviceQueueFamilyProperties2KHR(
    VkPhysicalDevice                          physicalDevice,
    uint32_t*                                pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2*                 pQueueFamilyProperties);
```

- **physicalDevice** is the handle to the physical device whose properties will be queried.
- **pQueueFamilyPropertyCount** is a pointer to an integer related to the number of queue families available or queried, as described in [vkGetPhysicalDeviceQueueFamilyProperties](#).
- **pQueueFamilyProperties** is either **NULL** or a pointer to an array of [VkQueueFamilyProperties2](#) structures.

[vkGetPhysicalDeviceQueueFamilyProperties2](#) behaves similarly to [vkGetPhysicalDeviceQueueFamilyProperties](#), with the ability to return extended information in a **pNext** chain of output structures.

## Valid Usage (Implicit)

- **physicalDevice** **must** be a valid [VkPhysicalDevice](#) handle
- **pQueueFamilyPropertyCount** **must** be a valid pointer to a [uint32\\_t](#) value
- If the value referenced by **pQueueFamilyPropertyCount** is not **0**, and **pQueueFamilyProperties** is not **NULL**, **pQueueFamilyProperties** **must** be a valid pointer to an array of **pQueueFamilyPropertyCount** [VkQueueFamilyProperties2](#) structures

The [VkQueueFamilyProperties2](#) structure is defined as:

```
typedef struct VkQueueFamilyProperties2 {
    VkStructureType          sType;
    void*                   pNext;
    VkQueueFamilyProperties queueFamilyProperties;
} VkQueueFamilyProperties2;
```

or the equivalent

```
typedef VkQueueFamilyProperties2 VkQueueFamilyProperties2KHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **queueFamilyProperties** is a [VkQueueFamilyProperties](#) structure which is populated with the same values as in [vkGetPhysicalDeviceQueueFamilyProperties](#).

## Valid Usage (Implicit)

- **sType** **must** be [VK\\_STRUCTURE\\_TYPE\\_QUEUE\\_FAMILY\\_PROPERTIES\\_2](#)
- **pNext** **must** be **NULL** or a pointer to a valid instance of [VkQueueFamilyCheckpointPropertiesNV](#)

Additional queue family information can be queried by setting [VkQueueFamilyProperties2::pNext](#) to point to an instance of the [VkQueueFamilyCheckpointPropertiesNV](#) structure.

The [VkQueueFamilyCheckpointPropertiesNV](#) structure is defined as:

```
typedef struct VkQueueFamilyCheckpointPropertiesNV {
    VkStructureType          sType;
    void*                    pNext;
    VkPipelineStageFlags     checkpointExecutionStageMask;
} VkQueueFamilyCheckpointPropertiesNV;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **checkpointExecutionStageMask** is a mask indicating which pipeline stages the implementation can execute checkpoint markers in.

## Valid Usage (Implicit)

- **sType** **must** be [VK\\_STRUCTURE\\_TYPE\\_QUEUE\\_FAMILY\\_CHECKPOINT\\_PROPERTIES\\_NV](#)

To enumerate the performance query counters available on a queue family of a physical device, call:

```
VkResult vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    VkPhysicalDevice                  physicalDevice,
    uint32_t                          queueFamilyIndex,
    uint32_t*                         pCounterCount,
    VkPerformanceCounterKHR*          pCounters,
    VkPerformanceCounterDescriptionKHR* pCounterDescriptions);
```

- **physicalDevice** is the handle to the physical device whose queue family performance query counter properties will be queried

- `queueFamilyIndex` is the index into the queue family of the physical device we want to get properties for
- `pCounterCount` is a pointer to an integer related to the number of counters available or queried, as described below
- `pCounters` is either `NULL` or a pointer to an array of `VkPerformanceCounterKHR` structures
- `pCounterDescriptions` is either `NULL` or a pointer to an array of `VkPerformanceCounterDescriptionKHR` structures

If `pCounters` is `NULL` and `pCounterDescriptions` is `NULL`, then the number of counters available is returned in `pCounterCount`. Otherwise, `pCounterCount` **must** point to a variable set by the user to the number of elements in the `pCounters`, `pCounterDescriptions`, or both arrays and on return the variable is overwritten with the number of structures actually written out. If `pCounterCount` is less than the number of counters available, at most `pCounterCount` structures will be written and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`.

## Valid Usage (Implicit)

- `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- `pCounterCount` **must** be a valid pointer to a `uint32_t` value
- If the value referenced by `pCounterCount` is not `0`, and `pCounters` is not `NULL`, `pCounters` **must** be a valid pointer to an array of `pCounterCount` `VkPerformanceCounterKHR` structures
- If the value referenced by `pCounterCount` is not `0`, and `pCounterDescriptions` is not `NULL`, `pCounterDescriptions` **must** be a valid pointer to an array of `pCounterCount` `VkPerformanceCounterDescriptionKHR` structures

## Return Codes

### Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkPerformanceCounterKHR` structure is defined as:

```

typedef struct VkPerformanceCounterKHR {
    VkStructureType          sType;
    const void*             pNext;
    VkPerformanceCounterUnitKHR unit;
    VkPerformanceCounterScopeKHR scope;
    VkPerformanceCounterStorageKHR storage;
    uint8_t                  uuid[VK_UUID_SIZE];
} VkPerformanceCounterKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **unit** is a **VkPerformanceCounterUnitKHR** specifying the unit that the counter data will record
- **scope** is a **VkPerformanceCounterScopeKHR** specifying the scope that the counter belongs to
- **storage** is a **VkPerformanceCounterStorageKHR** specifying the storage type that the counter's data uses
- **uuid** is an array of size **VK\_UUID\_SIZE**, containing 8-bit values that represent a universally unique identifier for the counter of the physical device.

### Valid Usage (Implicit)

- **sType** **must** be **VK\_STRUCTURE\_TYPE\_PERFORMANCE\_COUNTER\_KHR**
- **pNext** **must** be **NULL**

Performance counters have an associated unit. This unit describes how to interpret the performance counter result.

The performance counter unit types which **may** be returned in **VkPerformanceCounterKHR::unit** are:

```

typedef enum VkPerformanceCounterUnitKHR {
    VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR = 0,
    VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR = 1,
    VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR = 2,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR = 3,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR = 4,
    VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR = 5,
    VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR = 6,
    VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR = 7,
    VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR = 8,
    VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR = 9,
    VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR = 10,
    VK_PERFORMANCE_COUNTER_UNIT_MAX_ENUM_KHR = 0x7FFFFFFF
} VkPerformanceCounterUnitKHR;

```

- `VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR` - the performance counter unit is a generic data point
- `VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR` - the performance counter unit is a percentage (%)
- `VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR` - the performance counter unit is a value of nanoseconds (ns)
- `VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR` - the performance counter unit is a value of bytes
- `VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR` - the performance counter unit is a value of bytes/s
- `VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR` - the performance counter unit is a temperature reported in Kelvin
- `VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR` - the performance counter unit is a value of watts (W)
- `VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR` - the performance counter unit is a value of volts (V)
- `VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR` - the performance counter unit is a value of amps (A)
- `VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR` - the performance counter unit is a value of hertz (Hz)
- `VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR` - the performance counter unit is a value of cycles

Performance counters have an associated scope. This scope describes the granularity of a performance counter.

The performance counter scope types which **may** be returned in `VkPerformanceCounterKHR::scope` are:

```
typedef enum VkPerformanceCounterScopeKHR {
    VK_QUERY_SCOPE_COMMAND_BUFFER_KHR = 0,
    VK_QUERY_SCOPE_RENDER_PASS_KHR = 1,
    VK_QUERY_SCOPE_COMMAND_KHR = 2,
    VK_PERFORMANCE_COUNTER_SCOPE_MAX_ENUM_KHR = 0x7FFFFFFF
} VkPerformanceCounterScopeKHR;
```

- `VK_QUERY_SCOPE_COMMAND_BUFFER_KHR` - the performance counter scope is a single complete command buffer
- `VK_QUERY_SCOPE_RENDER_PASS_KHR` - the performance counter scope is zero or more complete render passes. The performance query containing the performance counter **must** begin and end outside a render pass instance
- `VK_QUERY_SCOPE_COMMAND_KHR` - the performance counter scope is zero or more commands

Performance counters have an associated storage. This storage describes the payload of a counter result.

The performance counter storage types which **may** be returned in `VkPerformanceCounterKHR::storage` are:

```

typedef enum VkPerformanceCounterStorageKHR {
    VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR = 0,
    VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR = 1,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR = 2,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR = 3,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR = 4,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR = 5,
    VK_PERFORMANCE_COUNTER_STORAGE_MAX_ENUM_KHR = 0x7FFFFFFF
} VkPerformanceCounterStorageKHR;

```

- **VK\_PERFORMANCE\_COUNTER\_STORAGE\_INT32\_KHR** - the performance counter storage is a 32-bit signed integer
- **VK\_PERFORMANCE\_COUNTER\_STORAGE\_INT64\_KHR** - the performance counter storage is a 64-bit signed integer
- **VK\_PERFORMANCE\_COUNTER\_STORAGE\_UINT32\_KHR** - the performance counter storage is a 32-bit unsigned integer
- **VK\_PERFORMANCE\_COUNTER\_STORAGE\_UINT64\_KHR** - the performance counter storage is a 64-bit unsigned integer
- **VK\_PERFORMANCE\_COUNTER\_STORAGE\_FLOAT32\_KHR** - the performance counter storage is a 32-bit floating-point
- **VK\_PERFORMANCE\_COUNTER\_STORAGE\_FLOAT64\_KHR** - the performance counter storage is a 64-bit floating-point

The **VkPerformanceCounterDescriptionKHR** structure is defined as:

```

typedef struct VkPerformanceCounterDescriptionKHR {
    VkStructureType                      sType;
    const void*                         pNext;
    VkPerformanceCounterDescriptionFlagsKHR flags;
    char                                name[VK_MAX_DESCRIPTION_SIZE];
    char                                category[VK_MAX_DESCRIPTION_SIZE];
    char                                description[VK_MAX_DESCRIPTION_SIZE];
} VkPerformanceCounterDescriptionKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **flags** is a bitmask of **VkPerformanceCounterDescriptionFlagBitsKHR** indicating the usage behavior for the counter
- **name** is an array of size **VK\_MAX\_DESCRIPTION\_SIZE**, containing a null-terminated UTF-8 string specifying the name of the counter
- **category** is an array of size **VK\_MAX\_DESCRIPTION\_SIZE**, containing a null-terminated UTF-8 string specifying the category of the counter
- **description** is an array of size **VK\_MAX\_DESCRIPTION\_SIZE**, containing a null-terminated UTF-8

string specifying the description of the counter

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR`
- `pNext` **must** be `NULL`

Bits which **can** be set in `VkPerformanceCounterDescriptionKHR::flags` to specify usage behavior for a command pool are:

```
typedef enum VkPerformanceCounterDescriptionFlagBitsKHR {
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_KHR = 0x00000001,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_KHR = 0x00000002,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_FLAG_BITS_MAX_ENUM_KHR = 0x7FFFFFFF
} VkPerformanceCounterDescriptionFlagBitsKHR;
```

- `VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_KHR` specifies that recording the counter **may** have a noticeable performance impact
- `VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_KHR` specifies that concurrently recording the counter while other submitted command buffers are running **may** impact the accuracy of the recording

```
typedef VkFlags VkPerformanceCounterDescriptionFlagsKHR;
```

`VkPerformanceCounterDescriptionFlagsKHR` is a bitmask type for setting a mask of zero or more `VkPerformanceCounterDescriptionFlagBitsKHR`.

## 4.2. Devices

Device objects represent logical connections to physical devices. Each device exposes a number of *queue families* each having one or more *queues*. All queues in a queue family support the same operations.

As described in [Physical Devices](#), a Vulkan application will first query for all physical devices in a system. Each physical device **can** then be queried for its capabilities, including its queue and queue family properties. Once an acceptable physical device is identified, an application will create a corresponding logical device. An application **must** create a separate logical device for each physical device it will use. The created logical device is then the primary interface to the physical device.

How to enumerate the physical devices in a system and query those physical devices for their queue family properties is described in the [Physical Device Enumeration](#) section above.

A single logical device **can** also be created from multiple physical devices, if those physical devices belong to the same device group. A *device group* is a set of physical devices that support accessing each other's memory and recording a single command buffer that **can** be executed on all the

physical devices. Device groups are enumerated by calling [vkEnumeratePhysicalDeviceGroups](#), and a logical device is created from a subset of the physical devices in a device group by passing the physical devices through [VkDeviceGroupCreateInfo](#). For two physical devices to be in the same device group, they **must** support identical extensions, features, and properties.

*Note*

Physical devices in the same device group **must** be so similar because there are no rules for how different features/properties would interact. They **must** return the same values for nearly every invariant [vkGetPhysicalDevice\\*](#) feature, property, capability, etc., but could potentially differ for certain queries based on things like having a different display connected, or different compositor, etc.. The specification does not attempt to enumerate which state is in each category, because such a list would quickly become out of date.

To retrieve a list of the device groups present in the system, call:

```
VkResult vkEnumeratePhysicalDeviceGroups(  
    VkInstance  
    uint32_t*  
    VkPhysicalDeviceGroupProperties*  
        instance,  
        pPhysicalDeviceGroupCount,  
        pPhysicalDeviceGroupProperties);
```

or the equivalent command

```
VkResult vkEnumeratePhysicalDeviceGroupsKHR(  
    VkInstance  
    uint32_t*  
    VkPhysicalDeviceGroupProperties*  
        instance,  
        pPhysicalDeviceGroupCount,  
        pPhysicalDeviceGroupProperties);
```

- `instance` is a handle to a Vulkan instance previously created with [vkCreateInstance](#).
- `pPhysicalDeviceGroupCount` is a pointer to an integer related to the number of device groups available or queried, as described below.
- `pPhysicalDeviceGroupProperties` is either `NULL` or a pointer to an array of [VkPhysicalDeviceGroupProperties](#) structures.

If `pPhysicalDeviceGroupProperties` is `NULL`, then the number of device groups available is returned in `pPhysicalDeviceGroupCount`. Otherwise, `pPhysicalDeviceGroupCount` **must** point to a variable set by the user to the number of elements in the `pPhysicalDeviceGroupProperties` array, and on return the variable is overwritten with the number of structures actually written to `pPhysicalDeviceGroupProperties`. If `pPhysicalDeviceGroupCount` is less than the number of device groups available, at most `pPhysicalDeviceGroupCount` structures will be written. If `pPhysicalDeviceGroupCount` is smaller than the number of device groups available, `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available device groups were returned.

Every physical device **must** be in exactly one device group.

## Valid Usage (Implicit)

- `instance` **must** be a valid `VkInstance` handle
- `pPhysicalDeviceGroupCount` **must** be a valid pointer to a `uint32_t` value
- If the value referenced by `pPhysicalDeviceGroupCount` is not `0`, and `pPhysicalDeviceGroupProperties` is not `NULL`, `pPhysicalDeviceGroupProperties` **must** be a valid pointer to an array of `pPhysicalDeviceGroupCount` `VkPhysicalDeviceGroupProperties` structures

## Return Codes

### Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkPhysicalDeviceGroupProperties` structure is defined as:

```
typedef struct VkPhysicalDeviceGroupProperties {
    VkStructureType    sType;
    void*              pNext;
    uint32_t            physicalDeviceCount;
    VkPhysicalDevice    physicalDevices[VK_MAX_DEVICE_GROUP_SIZE];
    VkBool32            subsetAllocation;
} VkPhysicalDeviceGroupProperties;
```

or the equivalent

```
typedef VkPhysicalDeviceGroupProperties VkPhysicalDeviceGroupPropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `physicalDeviceCount` is the number of physical devices in the group.
- `physicalDevices` is an array of `VK_MAX_DEVICE_GROUP_SIZE` `VkPhysicalDevice` handles representing all physical devices in the group. The first `physicalDeviceCount` elements of the array will be valid.
- `subsetAllocation` specifies whether logical devices created from the group support allocating device memory on a subset of devices, via the `deviceMask` member of the

`VkMemoryAllocateFlagsInfo`. If this is `VK_FALSE`, then all device memory allocations are made across all physical devices in the group. If `physicalDeviceCount` is 1, then `subsetAllocation` **must** be `VK_FALSE`.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES`
- `pNext` **must** be `NULL`

#### 4.2.1. Device Creation

Logical devices are represented by `VkDevice` handles:

```
VK_DEFINE_HANDLE(VkDevice)
```

A logical device is created as a *connection* to a physical device. To create a logical device, call:

```
VkResult vkCreateDevice(  
    VkPhysicalDevice physicalDevice,  
    const VkDeviceCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkDevice* pDevice);
```

- `physicalDevice` **must** be one of the device handles returned from a call to `vkEnumeratePhysicalDevices` (see [Physical Device Enumeration](#)).
- `pCreateInfo` is a pointer to a `VkDeviceCreateInfo` structure containing information about how to create the device.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pDevice` is a pointer to a handle in which the created `VkDevice` is returned.

`vkCreateDevice` verifies that extensions and features requested in the `ppEnabledExtensionNames` and `pEnabledFeatures` members of `pCreateInfo`, respectively, are supported by the implementation. If any requested extension is not supported, `vkCreateDevice` **must** return `VK_ERROR_EXTENSION_NOT_PRESENT`. If any requested feature is not supported, `vkCreateDevice` **must** return `VK_ERROR_FEATURE_NOT_PRESENT`. Support for extensions **can** be checked before creating a device by querying `vkEnumerateDeviceExtensionProperties`. Support for features **can** similarly be checked by querying `vkGetPhysicalDeviceFeatures`.

After verifying and enabling the extensions the `VkDevice` object is created and returned to the application. If a requested extension is only supported by a layer, both the layer and the extension need to be specified at `vkCreateInstance` time for the creation to succeed.

Multiple logical devices **can** be created from the same physical device. Logical device creation **may** fail due to lack of device-specific resources (in addition to the other errors). If that occurs,

`vkCreateDevice` will return `VK_ERROR_TOO_MANY_OBJECTS`.

## Valid Usage

- All required extensions for each extension in the `VkDeviceCreateInfo` `::ppEnabledExtensionNames` list **must** also be present in that list.

## Valid Usage (Implicit)

- `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkDeviceCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pDevice` **must** be a valid pointer to a `VkDevice` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_EXTENSION_NOT_PRESENT`
- `VK_ERROR_FEATURE_NOT_PRESENT`
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_DEVICE_LOST`

The `VkDeviceCreateInfo` structure is defined as:

```
typedef struct VkDeviceCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkDeviceCreateFlags        flags;
    uint32_t                  queueCreateInfoCount;
    const VkDeviceQueueCreateInfo* pQueueCreateInfos;
    uint32_t                  enabledLayerCount;
    const char* const*        ppEnabledLayerNames;
    uint32_t                  enabledExtensionCount;
    const char* const*        ppEnabledExtensionNames;
    const VkPhysicalDeviceFeatures* pEnabledFeatures;
} VkDeviceCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is reserved for future use.
- `queueCreateInfoCount` is the unsigned integer size of the `pQueueCreateInfos` array. Refer to the [Queue Creation](#) section below for further details.
- `pQueueCreateInfos` is a pointer to an array of `VkDeviceQueueCreateInfo` structures describing the queues that are requested to be created along with the logical device. Refer to the [Queue Creation](#) section below for further details.
- `enabledLayerCount` is deprecated and ignored.
- `ppEnabledLayerNames` is deprecated and ignored. See [Device Layer Deprecation](#).
- `enabledExtensionCount` is the number of device extensions to enable.
- `ppEnabledExtensionNames` is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable for the created device. See the [Extensions](#) section for further details.
- `pEnabledFeatures` is `NULL` or a pointer to a `VkPhysicalDeviceFeatures` structure containing boolean indicators of all the features to be enabled. Refer to the [Features](#) section for further details.

## Valid Usage

- The `queueFamilyIndex` member of each element of `pQueueCreateInfos` **must** be unique within `pQueueCreateInfos`, except that two members can share the same `queueFamilyIndex` if one is a protected-capable queue and one is not a protected-capable queue.
- If the `pNext` chain includes a `VkPhysicalDeviceFeatures2` structure, then `pEnabledFeatures` **must** be `NULL`
- `ppEnabledExtensionNames` **must** not contain `VK_AMD_negative_viewport_height`
- `ppEnabledExtensionNames` **must** not contain both `VK_KHR_buffer_device_address` and `VK_EXT_buffer_device_address`

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDeviceGroupDeviceCreateInfo`, `VkDeviceMemoryOverallocationCreateInfoAMD`, `VkPhysicalDevice16BitStorageFeatures`, `VkPhysicalDevice8BitStorageFeaturesKHR`, `VkPhysicalDeviceASTCDecodeFeaturesEXT`, `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT`, `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT`, `VkPhysicalDeviceBufferDeviceAddressFeaturesKHR`, `VkPhysicalDeviceCoherentMemoryFeaturesAMD`, `VkPhysicalDeviceComputeShaderDerivativesFeaturesNV`, `VkPhysicalDeviceConditionalRenderingFeaturesEXT`, `VkPhysicalDeviceCooperativeMatrixFeaturesNV`, `VkPhysicalDeviceCornerSampledImageFeaturesNV`, `VkPhysicalDeviceCoverageReductionModeFeaturesNV`, `VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV`, `VkPhysicalDeviceDepthClipEnableFeaturesEXT`, `VkPhysicalDeviceDescriptorIndexingFeaturesEXT`, `VkPhysicalDeviceExclusiveScissorFeaturesNV`, `VkPhysicalDeviceFragmentDensityMapFeaturesEXT`, `VkPhysicalDeviceFragmentShaderBarycentricFeaturesNV`, `VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT`, `VkPhysicalDeviceHostQueryResetFeaturesEXT`, `VkPhysicalDeviceImagelessFramebufferFeaturesKHR`, `VkPhysicalDeviceIndexTypeUint8FeaturesEXT`, `VkPhysicalDeviceInlineUniformBlockFeaturesEXT`, `VkPhysicalDeviceLineRasterizationFeaturesEXT`, `VkPhysicalDeviceMemoryPriorityFeaturesEXT`, `VkPhysicalDeviceMeshShaderFeaturesNV`, `VkPhysicalDeviceMultiviewFeatures`, `VkPhysicalDevicePerformanceQueryFeaturesKHR`, `VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR`, `VkPhysicalDeviceProtectedMemoryFeatures`, `VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV`, `VkPhysicalDeviceSamplerYcbcrConversionFeatures`, `VkPhysicalDeviceScalarBlockLayoutFeaturesEXT`, `VkPhysicalDeviceSeparateDepthStencilLayoutsFeaturesKHR`, `VkPhysicalDeviceShaderAtomicInt64FeaturesKHR`, `VkPhysicalDeviceShaderClockFeaturesKHR`, `VkPhysicalDeviceShaderDemoteToHelperInvocationFeaturesEXT`, `VkPhysicalDeviceShaderDrawParametersFeatures`, `VkPhysicalDeviceShaderFloat16Int8FeaturesKHR`, `VkPhysicalDeviceShaderImageFootprintFeaturesNV`, `VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL`, `VkPhysicalDeviceShaderSMBuiltinsFeaturesNV`, `VkPhysicalDeviceShaderSubgroupExtendedTypesFeaturesKHR`, `VkPhysicalDeviceShadingRateImageFeaturesNV`, `VkPhysicalDeviceSubgroupSizeControlFeaturesEXT`, `VkPhysicalDeviceFeatures2`,

```
VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT,  
VkPhysicalDeviceTextureCompressionASTCHDRFeaturesEXT,  
VkPhysicalDeviceTimelineSemaphoreFeaturesKHR,  
VkPhysicalDeviceTransformFeedbackFeaturesEXT,  
VkPhysicalDeviceUniformBufferStandardLayoutFeaturesKHR,  
VkPhysicalDeviceVariablePointersFeatures,  
VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT,  
VkPhysicalDeviceVulkanMemoryModelFeaturesKHR,  
VkPhysicalDeviceYcbcrImageArraysFeaturesEXT
```

or

- Each `sType` member in the `pNext` chain **must** be unique
- `flags` **must** be `0`
- `pQueueCreateInfos` **must** be a valid pointer to an array of `queueCreateInfoCount` valid `VkDeviceQueueCreateInfo` structures
- If `enabledLayerCount` is not `0`, `ppEnabledLayerNames` **must** be a valid pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings
- If `enabledExtensionCount` is not `0`, `ppEnabledExtensionNames` **must** be a valid pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings
- If `pEnabledFeatures` is not `NULL`, `pEnabledFeatures` **must** be a valid pointer to a valid `VkPhysicalDeviceFeatures` structure
- `queueCreateInfoCount` **must** be greater than `0`

```
typedef VkFlags VkDeviceCreateFlags;
```

`VkDeviceCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

A logical device **can** be created that connects to one or more physical devices by including a `VkDeviceGroupDeviceCreateInfo` structure in the `pNext` chain of `VkDeviceCreateInfo`. The `VkDeviceGroupDeviceCreateInfo` structure is defined as:

```
typedef struct VkDeviceGroupDeviceCreateInfo {  
    VkStructureType          sType;  
    const void*              pNext;  
    uint32_t                 physicalDeviceCount;  
    const VkPhysicalDevice*   pPhysicalDevices;  
} VkDeviceGroupDeviceCreateInfo;
```

or the equivalent

```
typedef VkDeviceGroupDeviceCreateInfo VkDeviceGroupDeviceCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.

- `physicalDeviceCount` is the number of elements in the `pPhysicalDevices` array.
- `pPhysicalDevices` is a pointer to an array of physical device handles belonging to the same device group.

The elements of the `pPhysicalDevices` array are an ordered list of the physical devices that the logical device represents. These **must** be a subset of a single device group, and need not be in the same order as they were enumerated. The order of the physical devices in the `pPhysicalDevices` array determines the *device index* of each physical device, with element *i* being assigned a device index of *i*. Certain commands and structures refer to one or more physical devices by using device indices or *device masks* formed using device indices.

A logical device created without using `VkDeviceGroupDeviceCreateInfo`, or with `physicalDeviceCount` equal to zero, is equivalent to a `physicalDeviceCount` of one and `pPhysicalDevices` pointing to the `physicalDevice` parameter to `vkCreateDevice`. In particular, the device index of that physical device is zero.

## Valid Usage

- Each element of `pPhysicalDevices` **must** be unique
- All elements of `pPhysicalDevices` **must** be in the same device group as enumerated by `vkEnumeratePhysicalDeviceGroups`
- If `physicalDeviceCount` is not `0`, the `physicalDevice` parameter of `vkCreateDevice` **must** be an element of `pPhysicalDevices`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO`
- If `physicalDeviceCount` is not `0`, `pPhysicalDevices` **must** be a valid pointer to an array of `physicalDeviceCount` valid `VkPhysicalDevice` handles

To specify whether device memory allocation is allowed beyond the size reported by `VkPhysicalDeviceMemoryProperties`, add a `VkDeviceMemoryOverallocationCreateInfoAMD` structure to the `pNext` chain of the `VkDeviceCreateInfo` structure. If this structure is not specified, it is as if the `VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD` value is used.

```
typedef struct VkDeviceMemoryOverallocationCreateInfoAMD {
    VkStructureType           sType;
    const void*               pNext;
    VkMemoryOverallocationBehaviorAMD   overallocationBehavior;
} VkDeviceMemoryOverallocationCreateInfoAMD;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.

- `overallocationBehavior` is the desired overallocation behavior.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_MEMORY_OVERALLOCATION_CREATE_INFO_AMD`
- `overallocationBehavior` **must** be a valid `VkMemoryOverallocationBehaviorAMD` value

Possible values for `VkDeviceMemoryOverallocationCreateInfoAMD::overallocationBehavior` include:

```
typedef enum VkMemoryOverallocationBehaviorAMD {
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD = 0,
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_ALLOWED_AMD = 1,
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_DISALLOWED_AMD = 2,
    VK_MEMORY_OVERALLOCATION_BEHAVIOR_MAX_ENUM_AMD = 0x7FFFFFFF
} VkMemoryOverallocationBehaviorAMD;
```

- `VK_MEMORY_OVERALLOCATION_BEHAVIOR_DEFAULT_AMD` lets the implementation decide if overallocation should be allowed.
- `VK_MEMORY_OVERALLOCATION_BEHAVIOR_ALLOWED_AMD` specifies overallocation is allowed if platform permits.
- `VK_MEMORY_OVERALLOCATION_BEHAVIOR_DISALLOWED_AMD` specifies the application is not allowed to allocate device memory beyond the heap sizes reported by `VkPhysicalDeviceMemoryProperties`. Allocations that are not explicitly made by the application within the scope of the Vulkan instance are not accounted for.

#### 4.2.2. Device Use

The following is a high-level list of `VkDevice` uses along with references on where to find more information:

- Creation of queues. See the [Queues](#) section below for further details.
- Creation and tracking of various synchronization constructs. See [Synchronization and Cache Control](#) for further details.
- Allocating, freeing, and managing memory. See [Memory Allocation](#) and [Resource Creation](#) for further details.
- Creation and destruction of command buffers and command buffer pools. See [Command Buffers](#) for further details.
- Creation, destruction, and management of graphics state. See [Pipelines](#) and [Resource Descriptors](#), among others, for further details.

#### 4.2.3. Lost Device

A logical device **may** become *lost* for a number of implementation-specific reasons, indicating that

pending and future command execution **may** fail and cause resources and backing memory to become undefined.

*Note*

Typical reasons for device loss will include things like execution timing out (to prevent denial of service), power management events, platform resource management, implementation errors.

Applications not adhering to [valid usage](#) may also result in device loss being reported, however this is not guaranteed. Even if device loss is reported, the system may be in an unrecoverable state, and further usage of the API is still considered invalid.

When this happens, certain commands will return [VK\\_ERROR\\_DEVICE\\_LOST](#) (see [Error Codes](#) for a list of such commands). After any such event, the logical device is considered *lost*. It is not possible to reset the logical device to a non-lost state, however the lost state is specific to a logical device ([VkDevice](#)), and the corresponding physical device ([VkPhysicalDevice](#)) **may** be otherwise unaffected.

In some cases, the physical device **may** also be lost, and attempting to create a new logical device will fail, returning [VK\\_ERROR\\_DEVICE\\_LOST](#). This is usually indicative of a problem with the underlying implementation, or its connection to the host. If the physical device has not been lost, and a new logical device is successfully created from that physical device, it **must** be in the non-lost state.

*Note*

Whilst logical device loss **may** be recoverable, in the case of physical device loss, it is unlikely that an application will be able to recover unless additional, unaffected physical devices exist on the system. The error is largely informational and intended only to inform the user that a platform issue has occurred, and **should** be investigated further. For example, underlying hardware **may** have developed a fault or become physically disconnected from the rest of the system. In many cases, physical device loss **may** cause other more serious issues such as the operating system crashing; in which case it **may** not be reported via the Vulkan API.

When a device is lost, its child objects are not implicitly destroyed and their handles are still valid. Those objects **must** still be destroyed before their parents or the device **can** be destroyed (see the [Object Lifetime](#) section). The host address space corresponding to device memory mapped using [vkMapMemory](#) is still valid, and host memory accesses to these mapped regions are still valid, but the contents are undefined. It is still legal to call any API command on the device and child objects.

Once a device is lost, command execution **may** fail, and commands that return a [VkResult](#) **may** return [VK\\_ERROR\\_DEVICE\\_LOST](#). Commands that do not allow run-time errors **must** still operate correctly for valid usage and, if applicable, return valid data.

Commands that wait indefinitely for device execution (namely [vkDeviceWaitIdle](#), [vkQueueWaitIdle](#), [vkWaitForFences](#) or [vkAcquireNextImageKHR](#) with a maximum [timeout](#), and [vkGetQueryPoolResults](#) with the [VK\\_QUERY\\_RESULT\\_WAIT\\_BIT](#) bit set in [flags](#)) **must** return in finite time even in the case of a lost device, and return either [VK\\_SUCCESS](#) or [VK\\_ERROR\\_DEVICE\\_LOST](#). For any

command that **may** return `VK_ERROR_DEVICE_LOST`, for the purpose of determining whether a command buffer is in the [pending state](#), or whether resources are considered in-use by the device, a return value of `VK_ERROR_DEVICE_LOST` is equivalent to `VK_SUCCESS`.

The content of any external memory objects that have been exported from or imported to a lost device become undefined. Objects on other logical devices or in other APIs which are associated with the same underlying memory resource as the external memory objects on the lost device are unaffected other than their content becoming undefined. The layout of subresources of images on other logical devices that are bound to `VkDeviceMemory` objects associated with the same underlying memory resources as external memory objects on the lost device becomes `VK_IMAGE_LAYOUT_UNDEFINED`.

The state of `VkSemaphore` objects on other logical devices created by [importing a semaphore payload](#) with temporary permanence which was exported from the lost device is undefined. The state of `VkSemaphore` objects on other logical devices that permanently share a semaphore payload with a `VkSemaphore` object on the lost device is undefined, and remains undefined following any subsequent signal operations. Implementations **must** ensure pending and subsequently submitted wait operations on such semaphores behave as defined in [Semaphore State Requirements For Wait Operations](#) for external semaphores not in a valid state for a wait operation.

#### 4.2.4. Device Destruction

To destroy a device, call:

```
void vkDestroyDevice(  
    VkDevice device,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

To ensure that no work is active on the device, `vkDeviceWaitIdle` **can** be used to gate the destruction of the device. Prior to destroying a device, an application is responsible for destroying/freeing any Vulkan objects that were created using that device as the first parameter of the corresponding `vkCreate*` or `vkAllocate*` command.

##### Note

The lifetime of each of these objects is bound by the lifetime of the `VkDevice` object. Therefore, to avoid resource leaks, it is critical that an application explicitly free all of these resources prior to calling `vkDestroyDevice`.

## Valid Usage

- All child objects created on `device` **must** have been destroyed prior to destroying `device`
- If `VkAllocationCallbacks` were provided when `device` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `device` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- If `device` is not `NULL`, `device` **must** be a valid `VkDevice` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

## Host Synchronization

- Host access to `device` **must** be externally synchronized

## 4.3. Queues

### 4.3.1. Queue Family Properties

As discussed in the [Physical Device Enumeration](#) section above, the `vkGetPhysicalDeviceQueueFamilyProperties` command is used to retrieve details about the queue families and queues supported by a device.

Each index in the `pQueueFamilyProperties` array returned by `vkGetPhysicalDeviceQueueFamilyProperties` describes a unique queue family on that physical device. These indices are used when creating queues, and they correspond directly with the `queueFamilyIndex` that is passed to the `vkCreateDevice` command via the `VkDeviceQueueCreateInfo` structure as described in the [Queue Creation](#) section below.

Grouping of queue families within a physical device is implementation-dependent.

#### Note

The general expectation is that a physical device groups all queues of matching capabilities into a single family. However, while implementations **should** do this, it is possible that a physical device **may** return two separate queue families with the same capabilities.

Once an application has identified a physical device with the queue(s) that it desires to use, it will create those queues in conjunction with a logical device. This is described in the following section.

### 4.3.2. Queue Creation

Creating a logical device also creates the queues associated with that device. The queues to create are described by a set of [VkDeviceQueueCreateInfo](#) structures that are passed to [vkCreateDevice](#) in `pQueueCreateInfos`.

Queues are represented by [VkQueue](#) handles:

```
VK_DEFINE_HANDLE(VkQueue)
```

The [VkDeviceQueueCreateInfo](#) structure is defined as:

```
typedef struct VkDeviceQueueCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkDeviceQueueCreateFlags  flags;
    uint32_t                 queueFamilyIndex;
    uint32_t                 queueCount;
    const float*             pQueuePriorities;
} VkDeviceQueueCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is a bitmask indicating behavior of the queue.
- `queueFamilyIndex` is an unsigned integer indicating the index of the queue family to create on this device. This index corresponds to the index of an element of the `pQueueFamilyProperties` array that was returned by [vkGetPhysicalDeviceQueueFamilyProperties](#).
- `queueCount` is an unsigned integer specifying the number of queues to create in the queue family indicated by `queueFamilyIndex`.
- `pQueuePriorities` is a pointer to an array of `queueCount` normalized floating point values, specifying priorities of work that will be submitted to each created queue. See [Queue Priority](#) for more information.

### Valid Usage

- `queueFamilyIndex` **must** be less than `pQueueFamilyPropertyCount` returned by [vkGetPhysicalDeviceQueueFamilyProperties](#)
- `queueCount` **must** be less than or equal to the `queueCount` member of the `VkQueueFamilyProperties` structure, as returned by [vkGetPhysicalDeviceQueueFamilyProperties](#) in the `pQueueFamilyProperties[queueFamilyIndex]`
- Each element of `pQueuePriorities` **must** be between `0.0` and `1.0` inclusive

## Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO`
- **pNext** must be `NULL` or a pointer to a valid instance of `VkDeviceQueueGlobalPriorityCreateInfoEXT`
- **flags** must be a valid combination of `VkDeviceQueueCreateFlagBits` values
- **pQueuePriorities** must be a valid pointer to an array of `queueCount float` values
- **queueCount** must be greater than `0`

Bits which **can** be set in `VkDeviceQueueCreateInfo::flags` to specify usage behavior of the queue are:

```
typedef enum VkDeviceQueueCreateFlagBits {
    VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT = 0x00000001,
    VK_DEVICE_QUEUE_CREATE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkDeviceQueueCreateFlagBits;
```

- `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT` specifies that the device queue is a protected-capable queue. If the protected memory feature is not enabled, the `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT` bit of `flags` must not be set.

```
typedef VkFlags VkDeviceQueueCreateFlags;
```

`VkDeviceQueueCreateFlags` is a bitmask type for setting a mask of zero or more `VkDeviceQueueCreateFlagBits`.

A queue can be created with a system-wide priority by including a `VkDeviceQueueGlobalPriorityCreateInfoEXT` structure in the `pNext` chain of `VkDeviceQueueCreateInfo`.

The `VkDeviceQueueGlobalPriorityCreateInfoEXT` structure is defined as:

```
typedef struct VkDeviceQueueGlobalPriorityCreateInfoEXT {
    VkStructureType           sType;
    const void*               pNext;
    VkQueueGlobalPriorityEXT  globalPriority;
} VkDeviceQueueGlobalPriorityCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `globalPriority` is the system-wide priority associated to this queue as specified by `VkQueueGlobalPriorityEXT`

A queue created without specifying `VkDeviceQueueGlobalPriorityCreateInfoEXT` will default to `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_GLOBAL_PRIORITY_CREATE_INFO_EXT`
- `globalPriority` must be a valid `VkQueueGlobalPriorityEXT` value

Possible values of `VkDeviceQueueGlobalPriorityCreateInfoEXT::globalPriority`, specifying a system-wide priority level are:

```
typedef enum VkQueueGlobalPriorityEXT {
    VK_QUEUE_GLOBAL_PRIORITY_LOW_EXT = 128,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT = 256,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_EXT = 512,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_EXT = 1024,
    VK_QUEUE_GLOBAL_PRIORITY_MAX_ENUM_EXT = 0x7FFFFFFF
} VkQueueGlobalPriorityEXT;
```

Priority values are sorted in ascending order. A comparison operation on the enum values can be used to determine the priority order.

- `VK_QUEUE_GLOBAL_PRIORITY_LOW_EXT` is below the system default. Useful for non-interactive tasks.
- `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT` is the system default priority.
- `VK_QUEUE_GLOBAL_PRIORITY_HIGH_EXT` is above the system default.
- `VK_QUEUE_GLOBAL_PRIORITY_REALTIME_EXT` is the highest priority. Useful for critical tasks.

Queues with higher system priority **may** be allotted more processing time than queues with lower priority. An implementation **may** allow a higher-priority queue to starve a lower-priority queue until the higher-priority queue has no further commands to execute.

Priorities imply no ordering or scheduling constraints.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

The global priority level of a queue takes precedence over the per-process queue priority (`VkDeviceQueueCreateInfo::pQueuePriorities`).

Abuse of this feature **may** result in starving the rest of the system of implementation resources. Therefore, the driver implementation **may** deny requests to acquire a priority above the default priority (`VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT`) if the caller does not have sufficient privileges. In this scenario `VK_ERROR_NOT_PERMITTED_EXT` is returned.

The driver implementation **may** fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this

scenario `VK_ERROR_INITIALIZATION_FAILED` is returned.

To retrieve a handle to a `VkQueue` object, call:

```
void vkGetDeviceQueue(  
    VkDevice  
    uint32_t  
    uint32_t  
    VkQueue*  
                                device,  
                                queueFamilyIndex,  
                                queueIndex,  
                                pQueue);
```

- `device` is the logical device that owns the queue.
- `queueFamilyIndex` is the index of the queue family to which the queue belongs.
- `queueIndex` is the index within this queue family of the queue to retrieve.
- `pQueue` is a pointer to a `VkQueue` object that will be filled with the handle for the requested queue.

`vkGetDeviceQueue` **must** only be used to get queues that were created with the `flags` parameter of `VkDeviceQueueCreateInfo` set to zero. To get queues that were created with a non-zero `flags` parameter use `vkGetDeviceQueue2`.

## Valid Usage

- `queueFamilyIndex` **must** be one of the queue family indices specified when `device` was created, via the `VkDeviceQueueCreateInfo` structure
- `queueIndex` **must** be less than the number of queues created for the specified queue family index when `device` was created, via the `queueCount` member of the `VkDeviceQueueCreateInfo` structure
- `VkDeviceQueueCreateInfo::flags` **must** have been set to zero when `device` was created

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pQueue` **must** be a valid pointer to a `VkQueue` handle

To retrieve a handle to a `VkQueue` object with specific `VkDeviceQueueCreateFlags` creation flags, call:

```
void vkGetDeviceQueue2(  
    VkDevice  
    const VkDeviceQueueCreateInfo*  
    VkQueue*  
                                device,  
                                pCreateInfo,  
                                pQueue);
```

- `device` is the logical device that owns the queue.

- `pQueueInfo` is a pointer to a `VkDeviceCreateInfo2` structure, describing the parameters used to create the device queue.
- `pQueue` is a pointer to a `VkQueue` object that will be filled with the handle for the requested queue.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pQueueInfo` **must** be a valid pointer to a valid `VkDeviceCreateInfo2` structure
- `pQueue` **must** be a valid pointer to a `VkQueue` handle

The `VkDeviceCreateInfo2` structure is defined as:

```
typedef struct VkDeviceCreateInfo2 {
    VkStructureType           sType;
    const void*               pNext;
    VkDeviceQueueCreateFlags   flags;
    uint32_t                  queueFamilyIndex;
    uint32_t                  queueIndex;
} VkDeviceCreateInfo2;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure. The `pNext` chain of `VkDeviceCreateInfo2` is used to provide additional image parameters to `vkGetDeviceQueue2`.
- `flags` is a `VkDeviceQueueCreateFlags` value indicating the flags used to create the device queue.
- `queueFamilyIndex` is the index of the queue family to which the queue belongs.
- `queueIndex` is the index within this queue family of the queue to retrieve.

The queue returned by `vkGetDeviceQueue2` **must** have the same `flags` value from this structure as that used at device creation time in a `VkDeviceQueueCreateInfo` instance. If no matching `flags` were specified at device creation time then `pQueue` will return `VK_NULL_HANDLE`.

## Valid Usage

- `queueFamilyIndex` **must** be one of the queue family indices specified when `device` was created, via the `VkDeviceCreateInfo` structure
- `queueIndex` **must** be less than the number of queues created for the specified queue family index and `VkDeviceQueueCreateInfo` member `flags` equal to this `flags` value when `device` was created, via the `queueCount` member of the `VkDeviceCreateInfo` structure

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_INFO_2`
- `pNext` **must** be `NULL`
- `flags` **must** be a valid combination of `VkDeviceQueueCreateInfoFlagBits` values
- `flags` **must** not be `0`

### 4.3.3. Queue Family Index

The queue family index is used in multiple places in Vulkan in order to tie operations to a specific family of queues.

When retrieving a handle to the queue via `vkGetDeviceQueue`, the queue family index is used to select which queue family to retrieve the `VkQueue` handle from as described in the previous section.

When creating a `VkCommandPool` object (see [Command Pools](#)), a queue family index is specified in the `VkCommandPoolCreateInfo` structure. Command buffers from this pool **can** only be submitted on queues corresponding to this queue family.

When creating `VkImage` (see [Images](#)) and `VkBuffer` (see [Buffers](#)) resources, a set of queue families is included in the `VkImageCreateInfo` and `VkBufferCreateInfo` structures to specify the queue families that **can** access the resource.

When inserting a `VkBufferMemoryBarrier` or `VkImageMemoryBarrier` (see [Pipeline Barriers](#)), a source and destination queue family index is specified to allow the ownership of a buffer or image to be transferred from one queue family to another. See the [Resource Sharing](#) section for details.

### 4.3.4. Queue Priority

Each queue is assigned a priority, as set in the `VkDeviceQueueCreateInfo` structures when creating the device. The priority of each queue is a normalized floating point value between 0.0 and 1.0, which is then translated to a discrete priority level by the implementation. Higher values indicate a higher priority, with 0.0 being the lowest priority and 1.0 being the highest.

Within the same device, queues with higher priority **may** be allotted more processing time than queues with lower priority. The implementation makes no guarantees with regards to ordering or scheduling among queues with the same priority, other than the constraints defined by any [explicit synchronization primitives](#). The implementation make no guarantees with regards to queues across different devices.

An implementation **may** allow a higher-priority queue to starve a lower-priority queue on the same `VkDevice` until the higher-priority queue has no further commands to execute. The relationship of queue priorities **must** not cause queues on one `VkDevice` to starve queues on another `VkDevice`.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

### 4.3.5. Queue Submission

Work is submitted to a queue via *queue submission* commands such as [vkQueueSubmit](#). Queue submission commands define a set of *queue operations* to be executed by the underlying physical device, including synchronization with semaphores and fences.

Submission commands take as parameters a target queue, zero or more *batches* of work, and an **optional** fence to signal upon completion. Each batch consists of three distinct parts:

1. Zero or more semaphores to wait on before execution of the rest of the batch.
  - If present, these describe a [semaphore wait operation](#).
2. Zero or more work items to execute.
  - If present, these describe a *queue operation* matching the work described.
3. Zero or more semaphores to signal upon completion of the work items.
  - If present, these describe a [semaphore signal operation](#).

If a fence is present in a queue submission, it describes a [fence signal operation](#).

All work described by a queue submission command **must** be submitted to the queue before the command returns.

### Sparse Memory Binding

In Vulkan it is possible to sparsely bind memory to buffers and images as described in the [Sparse Resource](#) chapter. Sparse memory binding is a queue operation. A queue whose flags include the `VK_QUEUE_SPARSE_BINDING_BIT` **must** be able to support the mapping of a virtual address to a physical address on the device. This causes an update to the page table mappings on the device. This update **must** be synchronized on a queue to avoid corrupting page table mappings during execution of graphics commands. By binding the sparse memory resources on queues, all commands that are dependent on the updated bindings are synchronized to only execute after the binding is updated. See the [Synchronization and Cache Control](#) chapter for how this synchronization is accomplished.

### 4.3.6. Queue Destruction

Queues are created along with a logical device during [vkCreateDevice](#). All queues associated with a logical device are destroyed when [vkDestroyDevice](#) is called on that device.

# Chapter 5. Command Buffers

Command buffers are objects used to record commands which **can** be subsequently submitted to a device queue for execution. There are two levels of command buffers - *primary command buffers*, which **can** execute secondary command buffers, and which are submitted to queues, and *secondary command buffers*, which **can** be executed by primary command buffers, and which are not directly submitted to queues.

Command buffers are represented by `VkCommandBuffer` handles:

```
VK_DEFINE_HANDLE(VkCommandBuffer)
```

Recorded commands include commands to bind pipelines and descriptor sets to the command buffer, commands to modify dynamic state, commands to draw (for graphics rendering), commands to dispatch (for compute), commands to execute secondary command buffers (for primary command buffers only), commands to copy buffers and images, and other commands.

Each command buffer manages state independently of other command buffers. There is no inheritance of state across primary and secondary command buffers, or between secondary command buffers. When a command buffer begins recording, all state in that command buffer is undefined. When secondary command buffer(s) are recorded to execute on a primary command buffer, the secondary command buffer inherits no state from the primary command buffer, and all state of the primary command buffer is undefined after an execute secondary command buffer command is recorded. There is one exception to this rule - if the primary command buffer is inside a render pass instance, then the render pass and subpass state is not disturbed by executing secondary command buffers. For state dependent commands (such as draws and dispatches), any state consumed by those commands **must** not be undefined.

Unless otherwise specified, and without explicit synchronization, the various commands submitted to a queue via command buffers **may** execute in arbitrary order relative to each other, and/or concurrently. Also, the memory side-effects of those commands **may** not be directly visible to other commands without explicit memory dependencies. This is true within a command buffer, and across command buffers submitted to a given queue. See [the synchronization chapter](#) for information on [implicit](#) and explicit synchronization between commands.

## 5.1. Command Buffer Lifecycle

Each command buffer is always in one of the following states:

### Initial

When a command buffer is [allocated](#), it is in the *initial state*. Some commands are able to *reset* a command buffer, or a set of command buffers, back to this state from any of the executable, recording or invalid state. Command buffers in the initial state **can** only be moved to the recording state, or freed.

### Recording

[vkBeginCommandBuffer](#) changes the state of a command buffer from the initial state to the

*recording state*. Once a command buffer is in the recording state, `vkCmd*` commands **can** be used to record to the command buffer.

## Executable

`vkEndCommandBuffer` ends the recording of a command buffer, and moves it from the recording state to the *executable state*. Executable command buffers **can** be [submitted](#), reset, or [recorded to another command buffer](#).

## Pending

[Queue submission](#) of a command buffer changes the state of a command buffer from the executable state to the *pending state*. Whilst in the pending state, applications **must** not attempt to modify the command buffer in any way - as the device **may** be processing the commands recorded to it. Once execution of a command buffer completes, the command buffer reverts back to either the *executable state*, or the *invalid state* if it was recorded with `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT`. A [synchronization](#) command **should** be used to detect when this occurs.

## Invalid

Some operations, such as [modifying or deleting a resource](#) that was used in a command recorded to a command buffer, will transition the state of that command buffer into the *invalid state*. Command buffers in the invalid state **can** only be reset or freed.

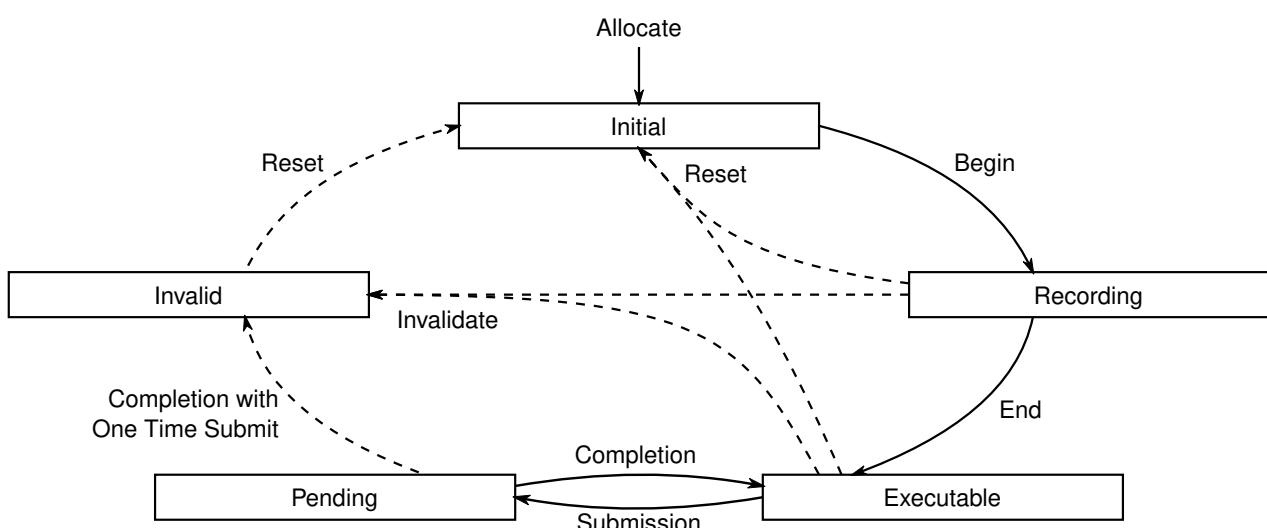

Figure 1. Lifecycle of a command buffer

Any given command that operates on a command buffer has its own requirements on what state a command buffer **must** be in, which are detailed in the valid usage constraints for that command.

Resetting a command buffer is an operation that discards any previously recorded commands and puts a command buffer in the initial state. Resetting occurs as a result of `vkResetCommandBuffer` or `vkResetCommandPool`, or as part of `vkBeginCommandBuffer` (which additionally puts the command buffer in the recording state).

Secondary command buffers **can** be recorded to a primary command buffer via `vkCmdExecuteCommands`. This partially ties the lifecycle of the two command buffers together - if the primary is submitted to a queue, both the primary and any secondaries recorded to it move to the pending state. Once execution of the primary completes, so does any secondary recorded within

it, and once all executions of each command buffer complete, they move to the executable state. If a secondary moves to any other state whilst it is recorded to another command buffer, the primary moves to the invalid state. A primary moving to any other state does not affect the state of the secondary. Resetting or freeing a primary command buffer removes the linkage to any secondary command buffers that were recorded to it.

## 5.2. Command Pools

Command pools are opaque objects that command buffer memory is allocated from, and which allow the implementation to amortize the cost of resource creation across multiple command buffers. Command pools are externally synchronized, meaning that a command pool **must** not be used concurrently in multiple threads. That includes use via recording commands on any command buffers allocated from the pool, as well as operations that allocate, free, and reset command buffers or the pool itself.

Command pools are represented by `VkCommandPool` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCommandPool)
```

To create a command pool, call:

```
VkResult vkCreateCommandPool(  
    VkDevice                                     device,  
    const VkCommandPoolCreateInfo*                pCreateInfo,  
    const VkAllocationCallbacks*                  pAllocator,  
    VkCommandPool*                                pCommandPool);
```

- `device` is the logical device that creates the command pool.
- `pCreateInfo` is a pointer to a `VkCommandPoolCreateInfo` structure specifying the state of the command pool object.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pCommandPool` is a pointer to a `VkCommandPool` handle in which the created pool is returned.

### Valid Usage

- `pCreateInfo::queueFamilyIndex` **must** be the index of a queue family available in the logical device `device`.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkCommandPoolCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pCommandPool` **must** be a valid pointer to a `VkCommandPool` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCommandPoolCreateInfo` structure is defined as:

```
typedef struct VkCommandPoolCreateInfo {
    VkStructureType          sType;
    const void*               pNext;
    VkCommandPoolCreateFlags   flags;
    uint32_t                  queueFamilyIndex;
} VkCommandPoolCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is a bitmask of `VkCommandPoolCreateFlagBits` indicating usage behavior for the pool and command buffers allocated from it.
- `queueFamilyIndex` designates a queue family as described in section [Queue Family Properties](#). All command buffers allocated from this command pool **must** be submitted on queues from the same queue family.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_POOL_CREATE_INFO`
- `pNext` **must** be `NULL`
- `flags` **must** be a valid combination of `VkCommandPoolCreateFlagBits` values

Bits which **can** be set in `VkCommandPoolCreateInfo::flags` to specify usage behavior for a

command pool are:

```
typedef enum VkCommandPoolCreateFlagBits {
    VK_COMMAND_POOL_CREATE_TRANSIENT_BIT = 0x00000001,
    VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT = 0x00000002,
    VK_COMMAND_POOL_CREATE_PROTECTED_BIT = 0x00000004,
    VK_COMMAND_POOL_CREATE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkCommandPoolCreateFlagBits;
```

- `VK_COMMAND_POOL_CREATE_TRANSIENT_BIT` specifies that command buffers allocated from the pool will be short-lived, meaning that they will be reset or freed in a relatively short timeframe. This flag **may** be used by the implementation to control memory allocation behavior within the pool.
- `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` allows any command buffer allocated from a pool to be individually reset to the [initial state](#); either by calling `vkResetCommandBuffer`, or via the implicit reset when calling `vkBeginCommandBuffer`. If this flag is not set on a pool, then `vkResetCommandBuffer` **must** not be called for any command buffer allocated from that pool.
- `VK_COMMAND_POOL_CREATE_PROTECTED_BIT` specifies that command buffers allocated from the pool are protected command buffers. If the protected memory feature is not enabled, the `VK_COMMAND_POOL_CREATE_PROTECTED_BIT` bit of `flags` **must** not be set.

```
typedef VkFlags VkCommandPoolCreateFlags;
```

`VkCommandPoolCreateFlags` is a bitmask type for setting a mask of zero or more `VkCommandPoolCreateFlagBits`.

To trim a command pool, call:

```
void vkTrimCommandPool(
    VkDevice                               device,
    VkCommandPool                         commandPool,
    VkCommandPoolTrimFlags                flags);
```

or the equivalent command

```
void vkTrimCommandPoolKHR(
    VkDevice                               device,
    VkCommandPool                         commandPool,
    VkCommandPoolTrimFlags                flags);
```

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool to trim.
- `flags` is reserved for future use.

Trimming a command pool recycles unused memory from the command pool back to the system.

Command buffers allocated from the pool are not affected by the command.

*Note*

This command provides applications with some control over the internal memory allocations used by command pools.

Unused memory normally arises from command buffers that have been recorded and later reset, such that they are no longer using the memory. On reset, a command buffer can return memory to its command pool, but the only way to release memory from a command pool to the system requires calling [vkResetCommandPool](#), which cannot be executed while any command buffers from that pool are still in use. Subsequent recording operations into command buffers will re-use this memory but since total memory requirements fluctuate over time, unused memory can accumulate.

In this situation, trimming a command pool **may** be useful to return unused memory back to the system, returning the total outstanding memory allocated by the pool back to a more “average” value.

Implementations utilize many internal allocation strategies that make it impossible to guarantee that all unused memory is released back to the system. For instance, an implementation of a command pool **may** involve allocating memory in bulk from the system and sub-allocating from that memory. In such an implementation any live command buffer that holds a reference to a bulk allocation would prevent that allocation from being freed, even if only a small proportion of the bulk allocation is in use.

In most cases trimming will result in a reduction in allocated but unused memory, but it does not guarantee the “ideal” behavior.

Trimming **may** be an expensive operation, and **should** not be called frequently. Trimming **should** be treated as a way to relieve memory pressure after application-known points when there exists enough unused memory that the cost of trimming is “worth” it.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `commandPool` **must** be a valid `VkCommandPool` handle
- `flags` **must** be `0`
- `commandPool` **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `commandPool` **must** be externally synchronized

```
typedef VkFlags VkCommandPoolTrimFlags;
```

or the equivalent

```
typedef VkCommandPoolTrimFlags VkCommandPoolTrimFlagsKHR;
```

`VkCommandPoolTrimFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To reset a command pool, call:

```
VkResult vkResetCommandPool(  
    VkDevice device,  
    VkCommandPool commandPool,  
    VkCommandPoolResetFlags flags);
```

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool to reset.
- `flags` is a bitmask of `VkCommandPoolResetFlagBits` controlling the reset operation.

Resetting a command pool recycles all of the resources from all of the command buffers allocated from the command pool back to the command pool. All command buffers that have been allocated from the command pool are put in the [initial state](#).

Any primary command buffer allocated from another `VkCommandPool` that is in the [recording or executable state](#) and has a secondary command buffer allocated from `commandPool` recorded into it, becomes [invalid](#).

## Valid Usage

- All `VkCommandBuffer` objects allocated from `commandPool` **must** not be in the [pending state](#)

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `commandPool` **must** be a valid `VkCommandPool` handle
- `flags` **must** be a valid combination of `VkCommandPoolResetFlagBits` values
- `commandPool` **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `commandPool` must be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Bits which **can** be set in `vkResetCommandPool::flags` to control the reset operation are:

```
typedef enum VkCommandPoolResetFlagBits {
    VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
    VK_COMMAND_POOL_RESET_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkCommandPoolResetFlagBits;
```

- `VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT` specifies that resetting a command pool recycles all of the resources from the command pool back to the system.

```
typedef VkFlags VkCommandPoolResetFlags;
```

`VkCommandPoolResetFlags` is a bitmask type for setting a mask of zero or more `VkCommandPoolResetFlagBits`.

To destroy a command pool, call:

```
void vkDestroyCommandPool(
    VkDevice                                     device,
    VkCommandPool                                commandPool,
    const VkAllocationCallbacks*                  pAllocator);
```

- `device` is the logical device that destroys the command pool.
- `commandPool` is the handle of the command pool to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

When a pool is destroyed, all command buffers allocated from the pool are [freed](#).

Any primary command buffer allocated from another `VkCommandPool` that is in the [recording](#) or [executable state](#) and has a secondary command buffer allocated from `commandPool` recorded into it,

becomes [invalid](#).

## Valid Usage

- All `VkCommandBuffer` objects allocated from `commandPool` **must** not be in the [pending state](#).
- If `VkAllocationCallbacks` were provided when `commandPool` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `commandPool` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `commandPool` is not `VK_NULL_HANDLE`, `commandPool` **must** be a valid `VkCommandPool` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `commandPool` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `commandPool` **must** be externally synchronized

## 5.3. Command Buffer Allocation and Management

To allocate command buffers, call:

```
VkResult vkAllocateCommandBuffers(
    VkDevice                                     device,
    const VkCommandBufferAllocateInfo* pAllocateInfo,
    VkCommandBuffer*                            pCommandBuffers);
```

- `device` is the logical device that owns the command pool.
- `pAllocateInfo` is a pointer to a `VkCommandBufferAllocateInfo` structure describing parameters of the allocation.
- `pCommandBuffers` is a pointer to an array of `VkCommandBuffer` handles in which the resulting command buffer objects are returned. The array **must** be at least the length specified by the `commandBufferCount` member of `pAllocateInfo`. Each allocated command buffer begins in the initial state.

`vkAllocateCommandBuffers` **can** be used to create multiple command buffers. If the creation of any of

those command buffers fails, the implementation **must** destroy all successfully created command buffer objects from this command, set all entries of the `pCommandBuffers` array to `NULL` and return the error.

When command buffers are first allocated, they are in the [initial state](#).

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pAllocateInfo` **must** be a valid pointer to a valid `VkCommandBufferAllocateInfo` structure
- `pCommandBuffers` **must** be a valid pointer to an array of `pAllocateInfo::commandBufferCount` `VkCommandBuffer` handles
- The value referenced by `pAllocateInfo::commandBufferCount` **must** be greater than `0`

## Host Synchronization

- Host access to `pAllocateInfo::commandPool` **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCommandBufferAllocateInfo` structure is defined as:

```
typedef struct VkCommandBufferAllocateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkCommandPool        commandPool;
    VkCommandBufferLevel level;
    uint32_t             commandBufferCount;
} VkCommandBufferAllocateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `commandPool` is the command pool from which the command buffers are allocated.
- `level` is a `VkCommandBufferLevel` value specifying the command buffer level.
- `commandBufferCount` is the number of command buffers to allocate from the pool.

## Valid Usage

- `commandBufferCount` **must** be greater than `0`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_ALLOCATE_INFO`
- `pNext` **must** be `NULL`
- `commandPool` **must** be a valid `VkCommandPool` handle
- `level` **must** be a valid `VkCommandBufferLevel` value

Possible values of `VkCommandBufferAllocateInfo::level`, specifying the command buffer level, are:

```
typedef enum VkCommandBufferLevel {  
    VK_COMMAND_BUFFER_LEVEL_PRIMARY = 0,  
    VK_COMMAND_BUFFER_LEVEL_SECONDARY = 1,  
    VK_COMMAND_BUFFER_LEVEL_MAX_ENUM = 0x7FFFFFFF  
} VkCommandBufferLevel;
```

- `VK_COMMAND_BUFFER_LEVEL_PRIMARY` specifies a primary command buffer.
- `VK_COMMAND_BUFFER_LEVEL_SECONDARY` specifies a secondary command buffer.

To reset command buffers, call:

```
VkResult vkResetCommandBuffer(  
    VkCommandBuffer  
    VkCommandBufferResetFlags  
        commandBuffer,  
        flags);
```

- `commandBuffer` is the command buffer to reset. The command buffer **can** be in any state other than `pending`, and is moved into the `initial state`.
- `flags` is a bitmask of `VkCommandBufferResetFlagBits` controlling the reset operation.

Any primary command buffer that is in the `recording or executable state` and has `commandBuffer` recorded into it, becomes `invalid`.

## Valid Usage

- `commandBuffer` **must** not be in the `pending state`
- `commandBuffer` **must** have been allocated from a pool that was created with the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `flags` **must** be a valid combination of `VkCommandBufferResetFlagBits` values

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Bits which **can** be set in `vkResetCommandBuffer::flags` to control the reset operation are:

```
typedef enum VkCommandBufferResetFlagBits {
    VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
    VK_COMMAND_BUFFER_RESET_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkCommandBufferResetFlagBits;
```

- `VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT` specifies that most or all memory resources currently owned by the command buffer **should** be returned to the parent command pool. If this flag is not set, then the command buffer **may** hold onto memory resources and reuse them when recording commands. `commandBuffer` is moved to the [initial state](#).

```
typedef VkFlags VkCommandBufferResetFlags;
```

`VkCommandBufferResetFlags` is a bitmask type for setting a mask of zero or more `VkCommandBufferResetFlagBits`.

To free command buffers, call:

```
void vkFreeCommandBuffers(
    VkDevice                                     device,
    VkCommandPool                                commandPool,
    uint32_t                                      commandBufferCount,
    const VkCommandBuffer*                        pCommandBuffers);
```

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool from which the command buffers were allocated.
- `commandBufferCount` is the length of the `pCommandBuffers` array.
- `pCommandBuffers` is a pointer to an array of handles of command buffers to free.

Any primary command buffer that is in the [recording or executable state](#) and has any element of `pCommandBuffers` recorded into it, becomes [invalid](#).

### Valid Usage

- All elements of `pCommandBuffers` **must** not be in the [pending state](#)
- `pCommandBuffers` **must** be a valid pointer to an array of `commandBufferCount` `VkCommandBuffer` handles, each element of which **must** either be a valid handle or `NULL`

### Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `commandPool` **must** be a valid `VkCommandPool` handle
- `commandBufferCount` **must** be greater than `0`
- `commandPool` **must** have been created, allocated, or retrieved from `device`
- Each element of `pCommandBuffers` that is a valid handle **must** have been created, allocated, or retrieved from `commandPool`

### Host Synchronization

- Host access to `commandPool` **must** be externally synchronized
- Host access to each member of `pCommandBuffers` **must** be externally synchronized

## 5.4. Command Buffer Recording

To begin recording a command buffer, call:

```
VkResult vkBeginCommandBuffer(
    VkCommandBuffer
    const VkCommandBufferBeginInfo*           commandBuffer,
                                            pBeginInfo);
```

- `commandBuffer` is the handle of the command buffer which is to be put in the recording state.
- `pBeginInfo` points to a `VkCommandBufferBeginInfo` structure defining additional information about how the command buffer begins recording.

## Valid Usage

- `commandBuffer` **must** not be in the `recording` or `pending` state.
- If `commandBuffer` was allocated from a `VkCommandPool` which did not have the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, `commandBuffer` **must** be in the `initial` state.
- If `commandBuffer` is a secondary command buffer, the `pInheritanceInfo` member of `pBeginInfo` **must** be a valid `VkCommandBufferInheritanceInfo` structure
- If `commandBuffer` is a secondary command buffer and either the `occlusionQueryEnable` member of the `pInheritanceInfo` member of `pBeginInfo` is `VK_FALSE`, or the precise occlusion queries feature is not enabled, the `queryFlags` member of the `pInheritanceInfo` member `pBeginInfo` **must** not contain `VK_QUERY_CONTROL_PRECISE_BIT`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `pBeginInfo` **must** be a valid pointer to a valid `VkCommandBufferBeginInfo` structure

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCommandBufferBeginInfo` structure is defined as:

```
typedef struct VkCommandBufferBeginInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkCommandBufferUsageFlags flags;
    const VkCommandBufferInheritanceInfo* pInheritanceInfo;
} VkCommandBufferBeginInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is a bitmask of `VkCommandBufferUsageFlagBits` specifying usage behavior for the command buffer.
- `pInheritanceInfo` is a pointer to a `VkCommandBufferInheritanceInfo` structure, used if `commandBuffer` is a secondary command buffer. If this is a primary command buffer, then this value is ignored.

## Valid Usage

- If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `renderPass` member of `pInheritanceInfo` **must** be a valid `VkRenderPass`
- If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `subpass` member of `pInheritanceInfo` **must** be a valid subpass index within the `renderPass` member of `pInheritanceInfo`
- If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `framebuffer` member of `pInheritanceInfo` **must** be either `VK_NULL_HANDLE`, or a valid `VkFramebuffer` that is compatible with the `renderPass` member of `pInheritanceInfo`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO`
- `pNext` **must** be `NULL` or a pointer to a valid instance of `VkDeviceGroupCommandBufferBeginInfo`
- `flags` **must** be a valid combination of `VkCommandBufferUsageFlagBits` values

Bits which **can** be set in `VkCommandBufferBeginInfo::flags` to specify usage behavior for a command buffer are:

```
typedef enum VkCommandBufferUsageFlagBits {
    VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT = 0x00000001,
    VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT = 0x00000002,
    VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT = 0x00000004,
    VK_COMMAND_BUFFER_USAGE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkCommandBufferUsageFlagBits;
```

- `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` specifies that each recording of the command buffer will only be submitted once, and the command buffer will be reset and recorded again between each submission.
- `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` specifies that a secondary command buffer is considered to be entirely inside a render pass. If this is a primary command buffer, then this bit is ignored.

- `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` specifies that a command buffer **can** be resubmitted to a queue while it is in the *pending state*, and recorded into multiple primary command buffers.

```
typedef VkFlags VkCommandBufferUsageFlags;
```

`VkCommandBufferUsageFlags` is a bitmask type for setting a mask of zero or more `VkCommandBufferUsageFlagBits`.

If the command buffer is a secondary command buffer, then the `VkCommandBufferInheritanceInfo` structure defines any state that will be inherited from the primary command buffer:

```
typedef struct VkCommandBufferInheritanceInfo {
    VkStructureType          sType;
    const void*               pNext;
    VkRenderPass              renderPass;
    uint32_t                  subpass;
    VkFramebuffer              framebuffer;
    VkBool32                  occlusionQueryEnable;
    VkQueryControlFlags       queryFlags;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkCommandBufferInheritanceInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `renderPass` is a `VkRenderPass` object defining which render passes the `VkCommandBuffer` will be **compatible** with and **can** be executed within. If the `VkCommandBuffer` will not be executed within a render pass instance, `renderPass` is ignored.
- `subpass` is the index of the subpass within the render pass instance that the `VkCommandBuffer` will be executed within. If the `VkCommandBuffer` will not be executed within a render pass instance, `subpass` is ignored.
- `framebuffer` optionally refers to the `VkFramebuffer` object that the `VkCommandBuffer` will be rendering to if it is executed within a render pass instance. It **can** be `VK_NULL_HANDLE` if the framebuffer is not known, or if the `VkCommandBuffer` will not be executed within a render pass instance.

#### Note

Specifying the exact framebuffer that the secondary command buffer will be executed with **may** result in better performance at command buffer execution time.

- `occlusionQueryEnable` specifies whether the command buffer **can** be executed while an occlusion query is active in the primary command buffer. If this is `VK_TRUE`, then this command buffer **can** be executed whether the primary command buffer has an occlusion query active or not. If this is `VK_FALSE`, then the primary command buffer **must** not have an occlusion query

active.

- `queryFlags` specifies the query flags that **can** be used by an active occlusion query in the primary command buffer when this secondary command buffer is executed. If this value includes the `VK_QUERY_CONTROL_PRECISE_BIT` bit, then the active query **can** return boolean results or actual sample counts. If this bit is not set, then the active query **must** not use the `VK_QUERY_CONTROL_PRECISE_BIT` bit.
- `pipelineStatistics` is a bitmask of `VkQueryPipelineStatisticFlagBits` specifying the set of pipeline statistics that **can** be counted by an active query in the primary command buffer when this secondary command buffer is executed. If this value includes a given bit, then this command buffer **can** be executed whether the primary command buffer has a pipeline statistics query active that includes this bit or not. If this value excludes a given bit, then the active pipeline statistics query **must** not be from a query pool that counts that statistic.

## Valid Usage

- If the `inherited queries` feature is not enabled, `occlusionQueryEnable` **must** be `VK_FALSE`
- If the `inherited queries` feature is enabled, `queryFlags` **must** be a valid combination of `VkQueryControlFlagBits` values
- If the `inherited queries` feature is not enabled, `queryFlags` **must** be `0`
- If the `pipeline statistics queries` feature is enabled, `pipelineStatistics` **must** be a valid combination of `VkQueryPipelineStatisticFlagBits` values
- If the `pipeline statistics queries` feature is not enabled, `pipelineStatistics` **must** be `0`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_INFO`
- `pNext` **must** be `NULL` or a pointer to a valid instance of `VkCommandBufferInheritanceConditionalRenderingInfoEXT`
- Both of `framebuffer`, and `renderPass` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

If `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` was not set when creating a command buffer, that command buffer **must** not be submitted to a queue whilst it is already in the `pending state`. If `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` is not set on a secondary command buffer, that command buffer **must** not be used more than once in a given primary command buffer.

### Note

On some implementations, not using the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` bit enables command buffers to be patched in-place if needed, rather than creating a copy of the command buffer.

If a command buffer is in the `invalid, or executable state`, and the command buffer was allocated

from a command pool with the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, then `vkBeginCommandBuffer` implicitly resets the command buffer, behaving as if `vkResetCommandBuffer` had been called with `VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT` not set. After the implicit reset, `commandBuffer` is moved to the [recording state](#).

If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceConditionalRenderingInfoEXT` structure, then that structure controls whether a command buffer **can** be executed while conditional rendering is [active](#) in the primary command buffer.

The `VkCommandBufferInheritanceConditionalRenderingInfoEXT` structure is defined as:

```
typedef struct VkCommandBufferInheritanceConditionalRenderingInfoEXT {
    VkStructureType sType;
    const void*     pNext;
    VkBool32        conditionalRenderingEnable;
} VkCommandBufferInheritanceConditionalRenderingInfoEXT;
```

- `sType` is the type of this structure
- `pNext` is `NULL` or a pointer to an extension-specific structure
- `conditionalRenderingEnable` specifies whether the command buffer **can** be executed while conditional rendering is active in the primary command buffer. If this is `VK_TRUE`, then this command buffer **can** be executed whether the primary command buffer has active conditional rendering or not. If this is `VK_FALSE`, then the primary command buffer **must** not have conditional rendering active.

If this structure is not present, the behavior is as if `conditionalRenderingEnable` is `VK_FALSE`.

## Valid Usage

- If the [inherited conditional rendering](#) feature is not enabled, `conditionalRenderingEnable` **must** be `VK_FALSE`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_CONDITIONAL_RENDERING_INFO_EXT`

Once recording starts, an application records a sequence of commands (`vkCmd*`) to set state in the command buffer, draw, dispatch, and other commands.

Several commands can also be recorded indirectly from `VkBuffer` content, see [Device-Generated Commands](#).

To complete recording of a command buffer, call:

```
VkResult vkEndCommandBuffer(  
    VkCommandBuffer  
        commandBuffer);
```

- `commandBuffer` is the command buffer to complete recording.

If there was an error during recording, the application will be notified by an unsuccessful return code returned by `vkEndCommandBuffer`. If the application wishes to further use the command buffer, the command buffer **must** be reset. The command buffer **must** have been in the `recording state`, and is moved to the `executable state`.

## Valid Usage

- `commandBuffer` **must** be in the `recording state`.
- If `commandBuffer` is a primary command buffer, there **must** not be an active render pass instance
- All queries made `active` during the recording of `commandBuffer` **must** have been made inactive
- Conditional rendering must not be `active`
- If `commandBuffer` is a secondary command buffer, there **must** not be an outstanding `vkCmdBeginDebugUtilsLabelEXT` command recorded to `commandBuffer` that has not previously been ended by a call to `vkCmdEndDebugUtilsLabelEXT`.
- If `commandBuffer` is a secondary command buffer, there **must** not be an outstanding `vkCmdDebugMarkerBeginEXT` command recorded to `commandBuffer` that has not previously been ended by a call to `vkCmdDebugMarkerEndEXT`.

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

When a command buffer is in the executable state, it **can** be submitted to a queue for execution.

## 5.5. Command Buffer Submission

To submit command buffers to a queue, call:

```
VkResult vkQueueSubmit(  
    VkQueue queue,  
    uint32_t submitCount,  
    const VkSubmitInfo* pSubmits,  
    VkFence fence);
```

- `queue` is the queue that the command buffers will be submitted to.
- `submitCount` is the number of elements in the `pSubmits` array.
- `pSubmits` is a pointer to an array of `VkSubmitInfo` structures, each specifying a command buffer submission batch.
- `fence` is an **optional** handle to a fence to be signaled once all submitted command buffers have completed execution. If `fence` is not `VK_NULL_HANDLE`, it defines a [fence signal operation](#).

#### Note

Submission can be a high overhead operation, and applications **should** attempt to batch work together into as few calls to `vkQueueSubmit` as possible.

`vkQueueSubmit` is a [queue submission command](#), with each batch defined by an element of `pSubmits` as an instance of the `VkSubmitInfo` structure. Batches begin execution in the order they appear in `pSubmits`, but **may** complete out of order.

Fence and semaphore operations submitted with `vkQueueSubmit` have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the [semaphore](#) and [fence](#) sections of the [synchronization chapter](#).

Details on the interaction of `pWaitDstStageMask` with synchronization are described in the [semaphore wait operation](#) section of the [synchronization chapter](#).

The order that batches appear in `pSubmits` is used to determine [submission order](#), and thus all the

[implicit ordering guarantees](#) that respect it. Other than these implicit ordering guarantees and any [explicit synchronization primitives](#), these batches **may** overlap or otherwise execute out of order.

If any command buffer submitted to this queue is in the [executable state](#), it is moved to the [pending state](#). Once execution of all submissions of a command buffer complete, it moves from the [pending state](#), back to the [executable state](#). If a command buffer was recorded with the [VK\\_COMMAND\\_BUFFER\\_USAGE\\_ONE\\_TIME\\_SUBMIT\\_BIT](#) flag, it instead moves back to the [invalid state](#).

If `vkQueueSubmit` fails, it **may** return [VK\\_ERROR\\_OUT\\_OF\\_HOST\\_MEMORY](#) or [VK\\_ERROR\\_OUT\\_OF\\_DEVICE\\_MEMORY](#). If it does, the implementation **must** ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by `pSubmits` is unaffected by the call or its failure. If `vkQueueSubmit` fails in such a way that the implementation is unable to make that guarantee, the implementation **must** return [VK\\_ERROR\\_DEVICE\\_LOST](#). See [Lost Device](#).

## Valid Usage

- If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be unsignaled
- If `fence` is not `VK_NULL_HANDLE`, `fence` **must** not be associated with any other queue command that has not yet completed execution on that queue
- Any calls to `vkCmdSetEvent`, `vkCmdResetEvent` or `vkCmdWaitEvents` that have been recorded into any of the command buffer elements of the `pCommandBuffers` member of any element of `pSubmits`, **must** not reference any `VkEvent` that is referenced by any of those commands in a command buffer that has been submitted to another queue and is still in the *pending state*.
- Any stage flag included in any element of the `pWaitDstStageMask` member of any element of `pSubmits` **must** be a pipeline stage supported by one of the capabilities of `queue`, as specified in the [table of supported pipeline stages](#).
- Each element of the `pSignalSemaphores` member of any element of `pSubmits` **must** be unsignaled when the semaphore signal operation it defines is executed on the device
- When a semaphore wait operation referring to a binary semaphore defined by any element of the `pWaitSemaphores` member of any element of `pSubmits` executes on `queue`, there **must** be no other queues waiting on the same semaphore.
- All elements of the `pWaitSemaphores` member of all elements of `pSubmits` **must** be semaphores that are signaled, or have [semaphore signal operations](#) previously submitted for execution.
- All elements of the `pWaitSemaphores` member of all elements of `pSubmits` created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_BINARY_KHR` **must** reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) **must** have also been submitted for execution.
- Each element of the `pCommandBuffers` member of each element of `pSubmits` **must** be in the [pending or executable state](#).
- If any element of the `pCommandBuffers` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it **must** not be in the *pending state*.
- Any [secondary command buffers recorded](#) into any element of the `pCommandBuffers` member of any element of `pSubmits` **must** be in the [pending or executable state](#).
- If any [secondary command buffers recorded](#) into any element of the `pCommandBuffers` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it **must** not be in the *pending state*.
- Each element of the `pCommandBuffers` member of each element of `pSubmits` **must** have been allocated from a `VkCommandPool` that was created for the same queue family `queue` belongs to.
- If any element of `pSubmits->pCommandBuffers` includes a [Queue Family Transfer Acquire Operation](#), there **must** exist a previously submitted [Queue Family Transfer Release Operation](#) on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such [acquire](#)

operations, and which happens before the acquire operation.

- If a command recorded into any element of `pCommandBuffers` was a `vkCmdBeginQuery` whose `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `profiling lock` **must** have been held continuously on the `VkDevice` that `queue` was retrieved from, throughout recording of those command buffers.
- Any resource created with `VK_SHARING_MODE_EXCLUSIVE` that is read by an operation specified by `pSubmits` **must** not be owned by any queue family other than the one which `queue` belongs to, at the time it is executed

## Valid Usage (Implicit)

- `queue` **must** be a valid `VkQueue` handle
- If `submitCount` is not `0`, `pSubmits` **must** be a valid pointer to an array of `submitCount` valid `VkSubmitInfo` structures
- If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be a valid `VkFence` handle
- Both of `fence`, and `queue` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `queue` **must** be externally synchronized
- Host access to `fence` **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
-	-	Any	-

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

The `VkSubmitInfo` structure is defined as:

```

typedef struct VkSubmitInfo {
    VkStructureType          sType;
    const void*             pNext;
    uint32_t                 waitSemaphoreCount;
    const VkSemaphore*      pWaitSemaphores;
    const VkPipelineStageFlags* pWaitDstStageMask;
    uint32_t                 commandBufferCount;
    const VkCommandBuffer*   pCommandBuffers;
    uint32_t                 signalSemaphoreCount;
    const VkSemaphore*      pSignalSemaphores;
} VkSubmitInfo;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **waitSemaphoreCount** is the number of semaphores upon which to wait before executing the command buffers for the batch.
- **pWaitSemaphores** is a pointer to an array of **VkSemaphore** handles upon which to wait before the command buffers for this batch begin execution. If semaphores to wait on are provided, they define a [semaphore wait operation](#).
- **pWaitDstStageMask** is a pointer to an array of pipeline stages at which each corresponding semaphore wait will occur.
- **commandBufferCount** is the number of command buffers to execute in the batch.
- **pCommandBuffers** is a pointer to an array of **VkCommandBuffer** handles to execute in the batch.
- **signalSemaphoreCount** is the number of semaphores to be signaled once the commands specified in **pCommandBuffers** have completed execution.
- **pSignalSemaphores** is a pointer to an array of **VkSemaphore** handles which will be signaled when the command buffers for this batch have completed execution. If semaphores to be signaled are provided, they define a [semaphore signal operation](#).

The order that command buffers appear in **pCommandBuffers** is used to determine [submission order](#), and thus all the [implicit ordering guarantees](#) that respect it. Other than these implicit ordering guarantees and any [explicit synchronization primitives](#), these command buffers **may** overlap or otherwise execute out of order.

## Valid Usage

- Each element of `pCommandBuffers` **must** not have been allocated with `VK_COMMAND_BUFFER_LEVEL_SECONDARY`
- If the `geometry shaders` feature is not enabled, each element of `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- If the `tessellation shaders` feature is not enabled, each element of `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- Each element of `pWaitDstStageMask` **must** not include `VK_PIPELINE_STAGE_HOST_BIT`.
- If any element of `pWaitSemaphores` or `pSignalSemaphores` was created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_TIMELINE_KHR` then the `pNext` chain **must** include an instance of `VkTimelineSemaphoreSubmitInfoKHR`
- If the `pNext` chain of this structure includes an instance of `VkTimelineSemaphoreSubmitInfoKHR` and any element of `pWaitSemaphores` was created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_TIMELINE_KHR` then its `waitSemaphoreValueCount` member **must** equal `waitForSemaphoreCount`
- If the `pNext` chain of this structure includes an instance of `VkTimelineSemaphoreSubmitInfoKHR` and any element of `pSignalSemaphores` was created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_TIMELINE_KHR` then its `signalSemaphoreValueCount` member **must** equal `signalSemaphoreCount`
- For each element of `pSignalSemaphores` created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_TIMELINE_KHR` the corresponding element of `VkTimelineSemaphoreSubmitInfoKHR::pSignalSemaphoreValues` **must** have a value greater than the current value of the semaphore when the `semaphore signal operation` is executed
- For each element of `pWaitSemaphores` created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_TIMELINE_KHR` the corresponding element of `VkTimelineSemaphoreSubmitInfoKHR::pWaitSemaphoreValues` **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.
- For each element of `pSignalSemaphores` created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_TIMELINE_KHR` the corresponding element of `VkTimelineSemaphoreSubmitInfoKHR::pSignalSemaphoreValues` **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.
- If the `mesh shaders` feature is not enabled, each element of `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`
- If the `task shaders` feature is not enabled, each element of `pWaitDstStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_SUBMIT_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkD3D12FenceSubmitInfoKHR`, `VkDeviceGroupSubmitInfo`, `VkProtectedSubmitInfo`, `VkWin32KeyedMutexAcquireReleaseInfoKHR`, `VkWin32KeyedMutexAcquireReleaseInfoNV` or `VkTimelineSemaphoreSubmitInfoKHR`,
- Each `sType` member in the `pNext` chain must be unique
- If `waitSemaphoreCount` is not `0`, `pWaitSemaphores` must be a valid pointer to an array of `waitSemaphoreCount` valid `VkSemaphore` handles
- If `waitSemaphoreCount` is not `0`, `pWaitDstStageMask` must be a valid pointer to an array of `waitSemaphoreCount` valid combinations of `VkPipelineStageFlagBits` values
- Each element of `pWaitDstStageMask` must not be `0`
- If `commandBufferCount` is not `0`, `pCommandBuffers` must be a valid pointer to an array of `commandBufferCount` valid `VkCommandBuffer` handles
- If `signalSemaphoreCount` is not `0`, `pSignalSemaphores` must be a valid pointer to an array of `signalSemaphoreCount` valid `VkSemaphore` handles
- Each of the elements of `pCommandBuffers`, the elements of `pSignalSemaphores`, and the elements of `pWaitSemaphores` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

To specify the values to use when waiting for and signaling semaphores created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_TIMELINE_KHR`, add the `VkTimelineSemaphoreSubmitInfoKHR` structure to the `pNext` chain of the `VkSubmitInfo` structure when using `vkQueueSubmit` or the `VkBindSparseInfo` structure when using `vkQueueBindSparse`. The `VkTimelineSemaphoreSubmitInfoKHR` structure is defined as:

```
typedef struct VkTimelineSemaphoreSubmitInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreValueCount;
    const uint64_t*    pWaitSemaphoreValues;
    uint32_t           signalSemaphoreValueCount;
    const uint64_t*    pSignalSemaphoreValues;
} VkTimelineSemaphoreSubmitInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `waitSemaphoreValueCount` is the number of semaphore wait values specified in `pWaitSemaphoreValues`.

- `pWaitSemaphoreValues` is an array of length `waitSemaphoreValueCount` containing values for the corresponding semaphores in `VkSubmitInfo::pWaitSemaphores` to wait for.
- `signalSemaphoreValueCount` is the number of semaphore signal values specified in `pSignalSemaphoreValues`.
- `pSignalSemaphoreValues` is an array of length `signalSemaphoreValueCount` containing values for the corresponding semaphores in `VkSubmitInfo::pSignalSemaphores` to set when signaled.

If the semaphore in `VkSubmitInfo::pWaitSemaphores` or `VkSubmitInfo::pSignalSemaphores` corresponding to an entry in `pWaitSemaphoreValues` or `pSignalSemaphoreValues` respectively was not created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_TIMELINE_KHR`, the implementation **must** ignore the value in the `pWaitSemaphoreValues` or `pSignalSemaphoreValues` entry.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_TIMELINE_SEMAPHORE_SUBMIT_INFO_KHR`
- If `waitSemaphoreValueCount` is not `0`, and `pWaitSemaphoreValues` is not `NULL`, `pWaitSemaphoreValues` **must** be a valid pointer to an array of `waitSemaphoreValueCount` `uint64_t` values
- If `signalSemaphoreValueCount` is not `0`, and `pSignalSemaphoreValues` is not `NULL`, `pSignalSemaphoreValues` **must** be a valid pointer to an array of `signalSemaphoreValueCount` `uint64_t` values

To specify the values to use when waiting for and signaling semaphores whose [current payload](#) refers to a Direct3D 12 fence, add the `VkD3D12FenceSubmitInfoKHR` structure to the `pNext` chain of the `VkSubmitInfo` structure. The `VkD3D12FenceSubmitInfoKHR` structure is defined as:

```
typedef struct VkD3D12FenceSubmitInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreValuesCount;
    const uint64_t* pWaitSemaphoreValues;
    uint32_t signalSemaphoreValuesCount;
    const uint64_t* pSignalSemaphoreValues;
} VkD3D12FenceSubmitInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `waitSemaphoreValuesCount` is the number of semaphore wait values specified in `pWaitSemaphoreValues`.
- `pWaitSemaphoreValues` is a pointer to an array of `waitSemaphoreValuesCount` values for the corresponding semaphores in `VkSubmitInfo::pWaitSemaphores` to wait for.
- `signalSemaphoreValuesCount` is the number of semaphore signal values specified in `pSignalSemaphoreValues`.

- `pSignalSemaphoreValues` is a pointer to an array of `signalSemaphoreValuesCount` values for the corresponding semaphores in `VkSubmitInfo::pSignalSemaphores` to set when signaled.

If the semaphore in `VkSubmitInfo::pWaitSemaphores` or `VkSubmitInfo::pSignalSemaphores` corresponding to an entry in `pWaitSemaphoreValues` or `pSignalSemaphoreValues` respectively does not currently have a `payload` referring to a Direct3D 12 fence, the implementation **must** ignore the value in the `pWaitSemaphoreValues` or `pSignalSemaphoreValues` entry.

*Note*

As the introduction of the external semaphore handle type `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_BINARY_KHR` is preserved for backwards compatibility. However, applications **should** prefer importing such handle types into semaphores created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_TIMELINE_KHR`, and use the `VkTimelineSemaphoreSubmitInfoKHR` structure instead of the `VkD3D12FenceSubmitInfoKHR` structure to specify the values to use when waiting for and signaling such semaphores.

## Valid Usage

- `waitSemaphoreValuesCount` **must** be the same value as `VkSubmitInfo::waitSemaphoreCount`, where `VkSubmitInfo` is in the `pNext` chain of this `VkD3D12FenceSubmitInfoKHR` structure.
- `signalSemaphoreValuesCount` **must** be the same value as `VkSubmitInfo::signalSemaphoreCount`, where `VkSubmitInfo` is in the `pNext` chain of this `VkD3D12FenceSubmitInfoKHR` structure.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_D3D12_FENCE_SUBMIT_INFO_KHR`
- If `waitSemaphoreValuesCount` is not `0`, and `pWaitSemaphoreValues` is not `NULL`, `pWaitSemaphoreValues` **must** be a valid pointer to an array of `waitSemaphoreValuesCount` `uint64_t` values
- If `signalSemaphoreValuesCount` is not `0`, and `pSignalSemaphoreValues` is not `NULL`, `pSignalSemaphoreValues` **must** be a valid pointer to an array of `signalSemaphoreValuesCount` `uint64_t` values

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism **may** be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They **can** only be used if the imported resource was created with the `D3D11_RESOURCE_MISC_SHARED_KEYEDMUTEX` flag.

To acquire keyed mutexes before submitted work and/or release them after, add a `VkWin32KeyedMutexAcquireReleaseInfoKHR` structure to the `pNext` chain of the `VkSubmitInfo` structure.

The `VkWin32KeyedMutexAcquireReleaseInfoKHR` structure is defined as:

```
typedef struct VkWin32KeyedMutexAcquireReleaseInfoKHR {
    VkStructureType         sType;
    const void*             pNext;
    uint32_t                acquireCount;
    const VkDeviceMemory*   pAcquireSyncs;
    const uint64_t*          pAcquireKeys;
    const uint32_t*          pAcquireTimeouts;
    uint32_t                releaseCount;
    const VkDeviceMemory*   pReleaseSyncs;
    const uint64_t*          pReleaseKeys;
} VkWin32KeyedMutexAcquireReleaseInfoKHR;
```

- `acquireCount` is the number of entries in the `pAcquireSyncs`, `pAcquireKeys`, and `pAcquireTimeoutMilliseconds` arrays.
- `pAcquireSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pAcquireKeys` is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in `pAcquireSyncs`.
- `pAcquireTimeoutMilliseconds` is a pointer to an array of timeout values, in millisecond units, for each acquire specified in `pAcquireKeys`.
- `releaseCount` is the number of entries in the `pReleaseSyncs` and `pReleaseKeys` arrays.
- `pReleaseSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pReleaseKeys` is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in `pReleaseSyncs`.

## Valid Usage

- Each member of `pAcquireSyncs` and `pReleaseSyncs` **must** be a device memory object imported by setting `VkImportMemoryWin32HandleInfoKHR::handleType` to `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_KHR`
- If `acquireCount` is not `0`, `pAcquireSyncs` **must** be a valid pointer to an array of `acquireCount` valid `VkDeviceMemory` handles
- If `acquireCount` is not `0`, `pAcquireKeys` **must** be a valid pointer to an array of `acquireCount` `uint64_t` values
- If `acquireCount` is not `0`, `pAcquireTimeouts` **must** be a valid pointer to an array of `acquireCount` `uint32_t` values
- If `releaseCount` is not `0`, `pReleaseSyncs` **must** be a valid pointer to an array of `releaseCount` valid `VkDeviceMemory` handles
- If `releaseCount` is not `0`, `pReleaseKeys` **must** be a valid pointer to an array of `releaseCount` `uint64_t` values
- Both of the elements of `pAcquireSyncs`, and the elements of `pReleaseSyncs` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism **may** be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They **can** only be used if the imported resource was created with the `D3D11_RESOURCE_MISC_SHARED_KEYEDMUTEX` flag.

To acquire keyed mutexes before submitted work and/or release them after, add a `VkWin32KeyedMutexAcquireReleaseInfoNV` structure to the `pNext` chain of the `VkSubmitInfo` structure.

The `VkWin32KeyedMutexAcquireReleaseInfoNV` structure is defined as:

```
typedef struct VkWin32KeyedMutexAcquireReleaseInfoNV {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 acquireCount;
    const VkDeviceMemory*    pAcquireSyncs;
    const uint64_t*          pAcquireKeys;
    const uint32_t*          pAcquireTimeoutMilliseconds;
    uint32_t                 releaseCount;
    const VkDeviceMemory*    pReleaseSyncs;
    const uint64_t*          pReleaseKeys;
} VkWin32KeyedMutexAcquireReleaseInfoNV;
```

- `acquireCount` is the number of entries in the `pAcquireSyncs`, `pAcquireKeys`, and `pAcquireTimeoutMilliseconds` arrays.
- `pAcquireSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from

Direct3D 11 resources.

- `pAcquireKeys` is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in `pAcquireSyncs`.
- `pAcquireTimeoutMilliseconds` is a pointer to an array of timeout values, in millisecond units, for each acquire specified in `pAcquireKeys`.
- `releaseCount` is the number of entries in the `pReleaseSyncs` and `pReleaseKeys` arrays.
- `pReleaseSyncs` is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
- `pReleaseKeys` is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in `pReleaseSyncs`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_NV`
- If `acquireCount` is not `0`, `pAcquireSyncs` **must** be a valid pointer to an array of `acquireCount` valid `VkDeviceMemory` handles
- If `acquireCount` is not `0`, `pAcquireKeys` **must** be a valid pointer to an array of `acquireCount` `uint64_t` values
- If `acquireCount` is not `0`, `pAcquireTimeoutMilliseconds` **must** be a valid pointer to an array of `acquireCount` `uint32_t` values
- If `releaseCount` is not `0`, `pReleaseSyncs` **must** be a valid pointer to an array of `releaseCount` valid `VkDeviceMemory` handles
- If `releaseCount` is not `0`, `pReleaseKeys` **must** be a valid pointer to an array of `releaseCount` `uint64_t` values
- Both of the elements of `pAcquireSyncs`, and the elements of `pReleaseSyncs` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

If the `pNext` chain of `VkSubmitInfo` includes a `VkProtectedSubmitInfo` structure, then the structure indicates whether the batch is protected. The `VkProtectedSubmitInfo` structure is defined as:

```
typedef struct VkProtectedSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           protectedSubmit;
} VkProtectedSubmitInfo;
```

- `protectedSubmit` specifies whether the batch is protected. If `protectedSubmit` is `VK_TRUE`, the batch is protected. If `protectedSubmit` is `VK_FALSE`, the batch is unprotected. If the `VkSubmitInfo::pNext` chain does not contain this structure, the batch is unprotected.

## Valid Usage

- If the protected memory feature is not enabled, `protectedSubmit` must not be `VK_TRUE`.
- If `protectedSubmit` is `VK_TRUE`, then each element of the `pCommandBuffers` array must be a protected command buffer.
- If `protectedSubmit` is `VK_FALSE`, then each element of the `pCommandBuffers` array must be an unprotected command buffer.
- If the `VkSubmitInfo::pNext` chain does not include a `VkProtectedSubmitInfo` structure, then each element of the command buffer of the `pCommandBuffers` array must be an unprotected command buffer.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_PROTECTED_SUBMIT_INFO`

If the `pNext` chain of `VkSubmitInfo` includes a `VkDeviceGroupSubmitInfo` structure, then that structure includes device indices and masks specifying which physical devices execute semaphore operations and command buffers.

The `VkDeviceGroupSubmitInfo` structure is defined as:

```
typedef struct VkDeviceGroupSubmitInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           waitSemaphoreCount;
    const uint32_t*    pWaitSemaphoreDeviceIndices;
    uint32_t           commandBufferCount;
    const uint32_t*    pCommandBufferDeviceMasks;
    uint32_t           signalSemaphoreCount;
    const uint32_t*    pSignalSemaphoreDeviceIndices;
} VkDeviceGroupSubmitInfo;
```

or the equivalent

```
typedef VkDeviceGroupSubmitInfo VkDeviceGroupSubmitInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `waitSemaphoreCount` is the number of elements in the `pWaitSemaphoreDeviceIndices` array.
- `pWaitSemaphoreDeviceIndices` is a pointer to an array of `waitSemaphoreCount` device indices indicating which physical device executes the semaphore wait operation in the corresponding element of `VkSubmitInfo::pWaitSemaphores`.

- `commandBufferCount` is the number of elements in the `pCommandBufferDeviceMasks` array.
- `pCommandBufferDeviceMasks` is a pointer to an array of `commandBufferCount` device masks indicating which physical devices execute the command buffer in the corresponding element of `VkSubmitInfo::pCommandBuffers`. A physical device executes the command buffer if the corresponding bit is set in the mask.
- `signalSemaphoreCount` is the number of elements in the `pSignalSemaphoreDeviceIndices` array.
- `pSignalSemaphoreDeviceIndices` is a pointer to an array of `signalSemaphoreCount` device indices indicating which physical device executes the semaphore signal operation in the corresponding element of `VkSubmitInfo::pSignalSemaphores`.

If this structure is not present, semaphore operations and command buffers execute on device index zero.

## Valid Usage

- `waitSemaphoreCount` **must** equal `VkSubmitInfo::waitSemaphoreCount`
- `commandBufferCount` **must** equal `VkSubmitInfo::commandBufferCount`
- `signalSemaphoreCount` **must** equal `VkSubmitInfo::signalSemaphoreCount`
- All elements of `pWaitSemaphoreDeviceIndices` and `pSignalSemaphoreDeviceIndices` **must** be valid device indices
- All elements of `pCommandBufferDeviceMasks` **must** be valid device masks

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_SUBMIT_INFO`
- If `waitSemaphoreCount` is not `0`, `pWaitSemaphoreDeviceIndices` **must** be a valid pointer to an array of `waitSemaphoreCount uint32_t` values
- If `commandBufferCount` is not `0`, `pCommandBufferDeviceMasks` **must** be a valid pointer to an array of `commandBufferCount uint32_t` values
- If `signalSemaphoreCount` is not `0`, `pSignalSemaphoreDeviceIndices` **must** be a valid pointer to an array of `signalSemaphoreCount uint32_t` values

If the `pNext` chain of `VkSubmitInfo` includes a `VkPerformanceQuerySubmitInfoKHR` structure, then the structure indicates which counter pass is active for the batch in that submit.

The `VkPerformanceQuerySubmitInfoKHR` structure is defined as:

```
typedef struct VkPerformanceQuerySubmitInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t counterPassIndex;
} VkPerformanceQuerySubmitInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `counterPassIndex` specifies which counter pass index is active.

If the `VkSubmitInfo::pNext` chain does not contain this structure, the batch defaults to use counter pass index 0.

### Valid Usage

- `counterPassIndex` **must** be less than the number of counter passes required by any queries within the batch. The required number of counter passes for a performance query is obtained by calling `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR`

## 5.6. Queue Forward Progress

When using binary semaphores, the application **must** ensure that command buffer submissions will be able to complete without any subsequent operations by the application on any queue. After any call to `vkQueueSubmit` (or other queue operation), for every queued wait on a semaphore created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_BINARY_KHR` there **must** be a prior signal of that semaphore that will not be consumed by a different wait on the semaphore.

When using timeline semaphores, wait-before-signal behavior is well-defined and applications **can** submit work via `vkQueueSubmit` which defines a `timeline semaphore wait operation` before submitting a corresponding `semaphore signal operation`. For each `timeline semaphore wait operation` defined by a call to `vkQueueSubmit`, the application **must** ensure that a corresponding `semaphore signal operation` is executed before forward progress can be made.

Command buffers in the submission **can** include `vkCmdWaitEvents` commands that wait on events that will not be signaled by earlier commands in the queue. Such events **must** be signaled by the application using `vkSetEvent`, and the `vkCmdWaitEvents` commands that wait upon them **must** not be inside a render pass instance. The event **must** be set before the `vkCmdWaitEvents` command is executed.

*Note*

Implementations may have some tolerance for waiting on events to be set, but this is defined outside of the scope of Vulkan.

## 5.7. Secondary Command Buffer Execution

A secondary command buffer **must** not be directly submitted to a queue. Instead, secondary command buffers are recorded to execute as part of a primary command buffer with the command:

```
void vkCmdExecuteCommands(  
    VkCommandBuffer  
    uint32_t  
    const VkCommandBuffer*  
                                commandBuffer,  
                                commandBufferCount,  
                                pCommandBuffers);
```

- `commandBuffer` is a handle to a primary command buffer that the secondary command buffers are executed in.
- `commandBufferCount` is the length of the `pCommandBuffers` array.
- `pCommandBuffers` is a pointer to an array of `commandBufferCount` secondary command buffer handles, which are recorded to execute in the primary command buffer in the order they are listed in the array.

If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, and it was recorded into any other primary command buffer which is currently in the [executable or recording state](#), that primary command buffer becomes [invalid](#).

## Valid Usage

- `commandBuffer` **must** have been allocated with a `level` of `VK_COMMAND_BUFFER_LEVEL_PRIMARY`
- Each element of `pCommandBuffers` **must** have been allocated with a `level` of `VK_COMMAND_BUFFER_LEVEL_SECONDARY`
- Each element of `pCommandBuffers` **must** be in the `pending` or `executable` state.
- If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, and it was recorded into any other primary command buffer, that primary command buffer **must** not be in the `pending` state
- If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not be in the `pending` state.
- If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not have already been recorded to `commandBuffer`.
- If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not appear more than once in `pCommandBuffers`.
- Each element of `pCommandBuffers` **must** have been allocated from a `VkCommandPool` that was created for the same queue family as the `VkCommandPool` from which `commandBuffer` was allocated
- If `vkCmdExecuteCommands` is being called within a render pass instance, that render pass instance **must** have been begun with the `contents` parameter of `vkCmdBeginRenderPass` set to `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS`
- If `vkCmdExecuteCommands` is being called within a render pass instance, each element of `pCommandBuffers` **must** have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`
- If `vkCmdExecuteCommands` is being called within a render pass instance, each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo::subpass` set to the index of the subpass which the given command buffer will be executed in
- If `vkCmdExecuteCommands` is being called within a render pass instance, the render passes specified in the `pBeginInfo::pInheritanceInfo::renderPass` members of the `vkBeginCommandBuffer` commands used to begin recording each element of `pCommandBuffers` **must** be `compatible` with the current render pass.
- If `vkCmdExecuteCommands` is being called within a render pass instance, and any element of `pCommandBuffers` was recorded with `VkCommandBufferInheritanceInfo::framebuffer` not equal to `VK_NULL_HANDLE`, that `VkFramebuffer` **must** match the `VkFramebuffer` used in the current render pass instance
- If `vkCmdExecuteCommands` is not being called within a render pass instance, each element of `pCommandBuffers` **must** not have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`
- If the `inherited queries` feature is not enabled, `commandBuffer` **must** not have any queries active

- If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query `active`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo` `::occlusionQueryEnable` set to `VK_TRUE`
- If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query `active`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo` `::queryFlags` having all bits set that are set for the query
- If `commandBuffer` has a `VK_QUERY_TYPE_PIPELINE_STATISTICS` query `active`, then each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo` `::pipelineStatistics` having all bits set that are set in the `VkQueryPool` the query uses
- Each element of `pCommandBuffers` **must** not begin any query types that are `active` in `commandBuffer`
- If `commandBuffer` is a protected command buffer, then each element of `pCommandBuffers` **must** be a protected command buffer.
- If `commandBuffer` is an unprotected command buffer, then each element of `pCommandBuffers` **must** be an unprotected command buffer.
- This command **must** not be recorded when transform feedback is active

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `pCommandBuffers` **must** be a valid pointer to an array of `commandBufferCount` valid `VkCommandBuffer` handles
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations
- `commandBuffer` **must** be a primary `VkCommandBuffer`
- `commandBufferCount` **must** be greater than `0`
- Both of `commandBuffer`, and the elements of `pCommandBuffers` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary	Both	Transfer Graphics Compute	

## 5.8. Command Buffer Device Mask

Each command buffer has a piece of state storing the current device mask of the command buffer. This mask controls which physical devices within the logical device all subsequent commands will execute on, including state-setting commands, action commands, and synchronization commands.

Scissor, exclusive scissor, and viewport state **can** be set to different values on each physical device (only when set as dynamic state), and each physical device will render using its local copy of the state. Other state is shared between physical devices, such that all physical devices use the most recently set values for the state. However, when recording an action command that uses a piece of state, the most recent command that set that state **must** have included all physical devices that execute the action command in its current device mask.

The command buffer's device mask is orthogonal to the `pCommandBufferDeviceMasks` member of `VkDeviceGroupSubmitInfo`. Commands only execute on a physical device if the device index is set in both device masks.

If the `pNext` chain of `VkCommandBufferBeginInfo` includes a `VkDeviceGroupCommandBufferBeginInfo` structure, then that structure includes an initial device mask for the command buffer.

The `VkDeviceGroupCommandBufferBeginInfo` structure is defined as:

```
typedef struct VkDeviceGroupCommandBufferBeginInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           deviceMask;
} VkDeviceGroupCommandBufferBeginInfo;
```

or the equivalent

```
typedef VkDeviceGroupCommandBufferBeginInfo VkDeviceGroupCommandBufferBeginInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `deviceMask` is the initial value of the command buffer's device mask.

The initial device mask also acts as an upper bound on the set of devices that **can** ever be in the

device mask in the command buffer.

If this structure is not present, the initial value of a command buffer's device mask is set to include all physical devices in the logical device when the command buffer begins recording.

## Valid Usage

- `deviceMask` **must** be a valid device mask value
- `deviceMask` **must** not be zero

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_COMMAND_BUFFER_BEGIN_INFO`

To update the current device mask of a command buffer, call:

```
void vkCmdSetDeviceMask(  
    VkCommandBuffer  
    uint32_t  
        commandBuffer,  
        deviceMask);
```

or the equivalent command

```
void vkCmdSetDeviceMaskKHR(  
    VkCommandBuffer  
    uint32_t  
        commandBuffer,  
        deviceMask);
```

- `commandBuffer` is command buffer whose current device mask is modified.
- `deviceMask` is the new value of the current device mask.

`deviceMask` is used to filter out subsequent commands from executing on all physical devices whose bit indices are not set in the mask, except commands beginning a render pass instance, commands transitioning to the next subpass in the render pass instance, and commands ending a render pass instance, which always execute on the set of physical devices whose bit indices are included in the `deviceMask` member of the instance of the `VkDeviceGroupRenderPassBeginInfo` structure passed to the command beginning the corresponding render pass instance.

## Valid Usage

- `deviceMask` **must** be a valid device mask value
- `deviceMask` **must** not be zero
- `deviceMask` **must** not include any set bits that were not in the `VkDeviceGroupCommandBufferBeginInfo::deviceMask` value when the command buffer began recording.
- If `vkCmdSetDeviceMask` is called inside a render pass instance, `deviceMask` **must** not include any set bits that were not in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` value when the render pass instance began recording.

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, compute, or transfer operations

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Graphics Compute Transfer	

# Chapter 6. Synchronization and Cache Control

Synchronization of access to resources is primarily the responsibility of the application in Vulkan. The order of execution of commands with respect to the host and other commands on the device has few implicit guarantees, and needs to be explicitly specified. Memory caches and other optimizations are also explicitly managed, requiring that the flow of data through the system is largely under application control.

Whilst some implicit guarantees exist between commands, five explicit synchronization mechanisms are exposed by Vulkan:

## Fences

Fences **can** be used to communicate to the host that execution of some task on the device has completed.

## Semaphores

Semaphores **can** be used to control resource access across multiple queues.

## Events

Events provide a fine-grained synchronization primitive which **can** be signaled either within a command buffer or by the host, and **can** be waited upon within a command buffer or queried on the host.

## Pipeline Barriers

Pipeline barriers also provide synchronization control within a command buffer, but at a single point, rather than with separate signal and wait operations.

## Render Passes

Render passes provide a useful synchronization framework for most rendering tasks, built upon the concepts in this chapter. Many cases that would otherwise need an application to use other synchronization primitives **can** be expressed more efficiently as part of a render pass.

## 6.1. Execution and Memory Dependencies

An *operation* is an arbitrary amount of work to be executed on the host, a device, or an external entity such as a presentation engine. Synchronization commands introduce explicit *execution dependencies*, and *memory dependencies* between two sets of operations defined by the command's two *synchronization scopes*.

The synchronization scopes define which other operations a synchronization command is able to create execution dependencies with. Any type of operation that is not in a synchronization command's synchronization scopes will not be included in the resulting dependency. For example, for many synchronization commands, the synchronization scopes **can** be limited to just operations executing in specific [pipeline stages](#), which allows other pipeline stages to be excluded from a dependency. Other scoping options are possible, depending on the particular command.

An *execution dependency* is a guarantee that for two sets of operations, the first set **must happen-before** the second set. If an operation happens-before another operation, then the first operation **must complete** before the second operation is initiated. More precisely:

- Let **A** and **B** be separate sets of operations.
- Let **S** be a synchronization command.
- Let **A<sub>s</sub>** and **B<sub>s</sub>** be the synchronization scopes of **S**.
- Let **A'** be the intersection of sets **A** and **A<sub>s</sub>**.
- Let **B'** be the intersection of sets **B** and **B<sub>s</sub>**.
- Submitting **A**, **S** and **B** for execution, in that order, will result in execution dependency **E** between **A'** and **B'**.
- Execution dependency **E** guarantees that **A'** happens-before **B'**.

An *execution dependency chain* is a sequence of execution dependencies that form a happens-before relation between the first dependency's **A'** and the final dependency's **B'**. For each consecutive pair of execution dependencies, a chain exists if the intersection of **B<sub>s</sub>** in the first dependency and **A<sub>s</sub>** in the second dependency is not an empty set. The formation of a single execution dependency from an execution dependency chain can be described by substituting the following in the description of execution dependencies:

- Let **S** be a set of synchronization commands that generate an execution dependency chain.
- Let **A<sub>s</sub>** be the first synchronization scope of the first command in **S**.
- Let **B<sub>s</sub>** be the second synchronization scope of the last command in **S**.

Execution dependencies alone are not sufficient to guarantee that values resulting from writes in one set of operations **can** be read from another set of operations.

Three additional types of operation are used to control memory access. *Availability operations* cause the values generated by specified memory write accesses to become *available* to a memory domain for future access. Any available value remains available until a subsequent write to the same memory location occurs (whether it is made available or not) or the memory is freed. *Memory domain operations* cause writes that are available to a source memory domain to become available to a destination memory domain (an example of this is making writes available to the host domain available to the device domain). *Visibility operations* cause values available to a memory domain to become *visible* to specified memory accesses.

Availability, visibility, memory domains, and memory domain operations are formally defined in the [Availability and Visibility](#) section of the [Memory Model](#) chapter. Which API operations perform each of these operations is defined in [Availability, Visibility, and Domain Operations](#).

A *memory dependency* is an execution dependency which includes availability and visibility operations such that:

- The first set of operations happens-before the availability operation.
- The availability operation happens-before the visibility operation.
- The visibility operation happens-before the second set of operations.

Once written values are made visible to a particular type of memory access, they **can** be read or written by that type of memory access. Most synchronization commands in Vulkan define a memory dependency.

The specific memory accesses that are made available and visible are defined by the *access scopes* of a memory dependency. Any type of access that is in a memory dependency's first access scope and occurs in **A'** is made available. Any type of access that is in a memory dependency's second access scope and occurs in **B'** has any available writes made visible to it. Any type of operation that is not in a synchronization command's access scopes will not be included in the resulting dependency.

A memory dependency enforces availability and visibility of memory accesses and execution order between two sets of operations. Adding to the description of [execution dependency chains](#):

- Let **a** be the set of memory accesses performed by **A'**.
- Let **b** be the set of memory accesses performed by **B'**.
- Let **a<sub>s</sub>** be the first access scope of the first command in **S**.
- Let **b<sub>s</sub>** be the second access scope of the last command in **S**.
- Let **a'** be the intersection of sets **a** and **a<sub>s</sub>**.
- Let **b'** be the intersection of sets **b** and **b<sub>s</sub>**.
- Submitting **A**, **S** and **B** for execution, in that order, will result in a memory dependency **m** between **A'** and **B'**.
- Memory dependency **m** guarantees that:
  - Memory writes in **a'** are made available.
  - Available memory writes, including those from **a'**, are made visible to **b'**.

*Note*

Execution and memory dependencies are used to solve data hazards, i.e. to ensure that read and write operations occur in a well-defined order. Write-after-read hazards can be solved with just an execution dependency, but read-after-write and write-after-write hazards need appropriate memory dependencies to be included between them. If an application does not include dependencies to solve these hazards, the results and execution orders of memory accesses are undefined.

### 6.1.1. Image Layout Transitions

Image subresources **can** be transitioned from one [layout](#) to another as part of a [memory dependency](#) (e.g. by using an [image memory barrier](#)). When a layout transition is specified in a memory dependency, it happens-after the availability operations in the memory dependency, and happens-before the visibility operations. Image layout transitions **may** perform read and write accesses on all memory bound to the image subresource range, so applications **must** ensure that all memory writes have been made [available](#) before a layout transition is executed. Available memory is automatically made visible to a layout transition, and writes performed by a layout transition are automatically made available.

Layout transitions always apply to a particular image subresource range, and specify both an old layout and new layout. If the old layout does not match the new layout, a transition occurs. The old layout **must** match the current layout of the image subresource range, with one exception. The old layout **can** always be specified as `VK_IMAGE_LAYOUT_UNDEFINED`, though doing so invalidates the contents of the image subresource range.

As image layout transitions **may** perform read and write accesses on the memory bound to the image, if the image subresource affected by the layout transition is bound to peer memory for any device in the current device mask then the memory heap the bound memory comes from **must** support the `VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT` and `VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT` capabilities as returned by `vkGetDeviceGroupPeerMemoryFeatures`.

*Note*

Setting the old layout to `VK_IMAGE_LAYOUT_UNDEFINED` implies that the contents of the image subresource need not be preserved. Implementations **may** use this information to avoid performing expensive data transition operations.

*Note*

Applications **must** ensure that layout transitions happen-after all operations accessing the image with the old layout, and happen-before any operations that will access the image with the new layout. Layout transitions are potentially read/write operations, so not defining appropriate memory dependencies to guarantee this will result in a data race.

Image layout transitions interact with [memory aliasing](#).

### 6.1.2. Pipeline Stages

The work performed by an [action or synchronization command](#) consists of multiple operations, which are performed as a sequence of logically independent steps known as *pipeline stages*. The exact pipeline stages executed depend on the particular command that is used, and current command buffer state when the command was recorded. [Drawing commands](#), [dispatching commands](#), [copy commands](#), [clear commands](#), and [synchronization commands](#) all execute in different sets of [pipeline stages](#). [Synchronization commands](#) do not execute in a defined pipeline, but do execute `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT` and `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`.

*Note*

Operations performed by synchronization commands (e.g. [availability and visibility operations](#)) are not executed by a defined pipeline stage. However other commands can still synchronize with them via the `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT` and `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT` pipeline stages.

Execution of operations across pipeline stages **must** adhere to [implicit ordering guarantees](#), particularly including [pipeline stage order](#). Otherwise, execution across pipeline stages **may** overlap or execute out of order with regards to other stages, unless otherwise enforced by an execution dependency.

Several of the synchronization commands include pipeline stage parameters, restricting the [synchronization scopes](#) for that command to just those stages. This allows fine grained control over the exact execution dependencies and accesses performed by action commands. Implementations **should** use these pipeline stages to avoid unnecessary stalls or cache flushing.

Bits which can be set, specifying pipeline stages, are:

```
typedef enum VkPipelineStageFlagBits {
    VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT = 0x00000001,
    VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT = 0x00000002,
    VK_PIPELINE_STAGE_VERTEX_INPUT_BIT = 0x00000004,
    VK_PIPELINE_STAGE_VERTEX_SHADER_BIT = 0x00000008,

    VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV = 0x00100000,
    VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT = 0x00800000,
    VK_PIPELINE_STAGE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkPipelineStageFlagBits;
```

- [VK\\_PIPELINE\\_STAGE\\_TOP\\_OF\\_PIPE\\_BIT](#) specifies the stage of the pipeline where any commands are initially received by the queue.
- [VK\\_PIPELINE\\_STAGE\\_DRAW\\_INDIRECT\\_BIT](#) specifies the stage of the pipeline where Draw/DispatchIndirect data structures are consumed. This stage also includes reading commands written by [vkCmdProcessCommandsNVX](#).
- [VK\\_PIPELINE\\_STAGE\\_TASK\\_SHADER\\_BIT\\_NV](#) specifies the task shader stage.
- [VK\\_PIPELINE\\_STAGE\\_MESH\\_SHADER\\_BIT\\_NV](#) specifies the mesh shader stage.
- [VK\\_PIPELINE\\_STAGE\\_VERTEX\\_INPUT\\_BIT](#) specifies the stage of the pipeline where vertex and index buffers are consumed.
- [VK\\_PIPELINE\\_STAGE\\_VERTEX\\_SHADER\\_BIT](#) specifies the vertex shader stage.

- `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` specifies the tessellation control shader stage.
- `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT` specifies the tessellation evaluation shader stage.
- `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT` specifies the geometry shader stage.
- `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT` specifies the fragment shader stage.
- `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes [subpass load operations](#) for framebuffer attachments with a depth/stencil format.
- `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes [subpass store operations](#) for framebuffer attachments with a depth/stencil format.
- `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` specifies the stage of the pipeline after blending where the final color values are output from the pipeline. This stage also includes [subpass load and store operations](#) and multisample resolve operations for framebuffer attachments with a color or depth/stencil format.
- `VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT` specifies the execution of a compute shader.
- `VK_PIPELINE_STAGE_TRANSFER_BIT` specifies the execution of copy commands. This includes the operations resulting from all [copy commands](#), [clear commands](#) (with the exception of `vkCmdClearAttachments`), and `vkCmdCopyQueryPoolResults`.
- `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT` specifies the final stage in the pipeline where operations generated by all commands complete execution.
- `VK_PIPELINE_STAGE_HOST_BIT` specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.
- `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_NV` specifies the execution of the ray tracing shader stages.
- `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_NV` specifies the execution of `vkCmdBuildAccelerationStructureNV`, `vkCmdCopyAccelerationStructureNV`, and `vkCmdWriteAccelerationStructuresPropertiesNV`.
- `VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT` specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
  - `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT`
  - `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT`
  - `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`
  - `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`
  - `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT`
  - `VK_PIPELINE_STAGE_VERTEX_SHADER_BIT`
  - `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT`
  - `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
  - `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT`
  - `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT`
  - `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT`
  - `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
  - `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`
  - `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
  - `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
  - `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV`
  - `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`
- `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` is equivalent to the logical OR of every other pipeline stage flag that is supported on the queue it is used with.
  - `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT` specifies the stage of the pipeline where the predicate of conditional rendering is consumed.
  - `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` specifies the stage of the pipeline where vertex attribute output values are written to the transform feedback buffers.
  - `VK_PIPELINE_STAGE_COMMAND_PROCESS_BIT_NVX` specifies the stage of the pipeline where device-side generation of commands via `vkCmdProcessCommandsNVX` is handled.
  - `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV` specifies the stage of the pipeline where the *shading rate image* is read to determine the shading rate for portions of a rasterized primitive.
  - `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT` specifies the stage of the pipeline where the fragment density map is read to *generate the fragment areas*.

*Note*

An execution dependency with only `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT` in the destination stage mask will only prevent that stage from executing in subsequently submitted commands. As this stage does not perform any actual execution, this is not observable - in effect, it does not delay processing of subsequent commands. Similarly an execution dependency with only `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT` in the source stage mask will effectively not wait for any prior commands to complete.

When defining a memory dependency, using only `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT` or `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT` would never make any accesses available and/or visible because these stages do not access memory.

`VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT` and `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT` are useful for accomplishing layout transitions and queue ownership operations when the required execution dependency is satisfied by other means - for example, semaphore operations between queues.

```
typedef VkFlags VkPipelineStageFlags;
```

`VkPipelineStageFlags` is a bitmask type for setting a mask of zero or more `VkPipelineStageFlagBits`.

If a synchronization command includes a source stage mask, its first [synchronization scope](#) only includes execution of the pipeline stages specified in that mask, and its first [access scope](#) only includes memory access performed by pipeline stages specified in that mask. If a synchronization command includes a destination stage mask, its second [synchronization scope](#) only includes execution of the pipeline stages specified in that mask, and its second [access scope](#) only includes memory access performed by pipeline stages specified in that mask.

*Note*

Including a particular pipeline stage in the first [synchronization scope](#) of a command implicitly includes [logically earlier](#) pipeline stages in the synchronization scope. Similarly, the second [synchronization scope](#) includes [logically later](#) pipeline stages.

However, note that [access scopes](#) are not affected in this way - only the precise stages specified are considered part of each access scope.

Certain pipeline stages are only available on queues that support a particular set of operations. The following table lists, for each pipeline stage flag, which queue capability flag **must** be supported by the queue. When multiple flags are enumerated in the second column of the table, it means that the pipeline stage is supported on the queue if it supports any of the listed capability flags. For further details on queue capabilities see [Physical Device Enumeration](#) and [Queues](#).

*Table 3. Supported pipeline stage flags*

Pipeline stage flag	Required queue capability flag
<code>VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT</code>	None required
<code>VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code> or <code>VK_QUEUE_COMPUTE_BIT</code>
<code>VK_PIPELINE_STAGE_VERTEX_INPUT_BIT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>
<code>VK_PIPELINE_STAGE_VERTEX_SHADER_BIT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>
<code>VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>
<code>VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>
<code>VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>
<code>VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>
<code>VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>
<code>VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>
<code>VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>
<code>VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT</code>	<code>VK_QUEUE_COMPUTE_BIT</code>
<code>VK_PIPELINE_STAGE_TRANSFER_BIT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code> , <code>VK_QUEUE_COMPUTE_BIT</code> or <code>VK_QUEUE_TRANSFER_BIT</code>
<code>VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT</code>	None required
<code>VK_PIPELINE_STAGE_HOST_BIT</code>	None required
<code>VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>
<code>VK_PIPELINE_STAGE_ALL_COMMANDS_BIT</code>	None required

Pipeline stage flag	Required queue capability flag
<code>VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code> or <code>VK_QUEUE_COMPUTE_BIT</code>
<code>VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>
<code>VK_PIPELINE_STAGE_COMMAND_PROCESS_BIT_NVX</code>	<code>VK_QUEUE_GRAPHICS_BIT</code> or <code>VK_QUEUE_COMPUTE_BIT</code>
<code>VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>
<code>VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>
<code>VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>
<code>VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_NV</code>	<code>VK_QUEUE_COMPUTE_BIT</code>
<code>VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_NV</code>	<code>VK_QUEUE_COMPUTE_BIT</code>
<code>VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT</code>	<code>VK_QUEUE_GRAPHICS_BIT</code>

Pipeline stages that execute as a result of a command logically complete execution in a specific order, such that completion of a logically later pipeline stage **must** not happen-before completion of a logically earlier stage. This means that including any stage in the source stage mask for a particular synchronization command also implies that any logically earlier stages are included in **A<sub>s</sub>** for that command.

Similarly, initiation of a logically earlier pipeline stage **must** not happen-after initiation of a logically later pipeline stage. Including any given stage in the destination stage mask for a particular synchronization command also implies that any logically later stages are included in **B<sub>s</sub>** for that command.

*Note*

Implementations **may** not support synchronization at every pipeline stage for every synchronization operation. If a pipeline stage that an implementation does not support synchronization for appears in a source stage mask, it **may** substitute any logically later stage in its place for the first synchronization scope. If a pipeline stage that an implementation does not support synchronization for appears in a destination stage mask, it **may** substitute any logically earlier stage in its place for the second synchronization scope.

For example, if an implementation is unable to signal an event immediately after vertex shader execution is complete, it **may** instead signal the event after color attachment output has completed.

If an implementation makes such a substitution, it **must** not affect the semantics of execution or memory dependencies or image and buffer memory barriers.

The order and set of pipeline stages executed by a given command is determined by the command's pipeline type, as described below:

For the graphics primitive shading pipeline, the following stages occur in this order:

- `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT`
- `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT`
- `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT`

- `VK_PIPELINE_STAGE_VERTEX_SHADER_BIT`
- `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT`
- `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`
- `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV`
- `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT`
- `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`

For the graphics mesh shading pipeline, the following stages occur in this order:

- `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT`
- `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT`
- `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`
- `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`
- `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV`
- `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT`
- `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`

For graphics pipeline commands executing in a render pass with a fragment density map attachment, the pipeline stage where the fragment density map read happens has no particular order relative to the other stages except that it happens before `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT`.

- `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

For the compute pipeline, the following stages occur in this order:

- `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT`
- `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT`
- `VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT`
- `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`

The conditional rendering stage is formally part of both the graphics, and the compute pipeline. The pipeline stage where the predicate read happens has unspecified order relative to other stages of these pipelines:

- `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

For the transfer pipeline, the following stages occur in this order:

- `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT`

- `VK_PIPELINE_STAGE_TRANSFER_BIT`
- `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`

For host operations, only one pipeline stage occurs, so no order is guaranteed:

- `VK_PIPELINE_STAGE_HOST_BIT`

For the command processing pipeline, the following stages occur in this order:

- `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT`
- `VK_PIPELINE_STAGE_COMMAND_PROCESS_BIT_NVX`
- `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`

For the ray tracing shader pipeline, only one pipeline stage occurs, so no order is guaranteed:

- `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_NV`

For ray tracing acceleration structure operations, only one pipeline stage occurs, so no order is guaranteed:

- `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_NV`

### 6.1.3. Access Types

Memory in Vulkan **can** be accessed from within shader invocations and via some fixed-function stages of the pipeline. The *access type* is a function of the [descriptor type](#) used, or how a fixed-function stage accesses memory. Each access type corresponds to a bit flag in [VkAccessFlagBits](#).

Some synchronization commands take sets of access types as parameters to define the [access scopes](#) of a memory dependency. If a synchronization command includes a source access mask, its first [access scope](#) only includes accesses via the access types specified in that mask. Similarly, if a synchronization command includes a destination access mask, its second [access scope](#) only includes accesses via the access types specified in that mask.

Access types that **can** be set in an access mask include:

```

typedef enum VkAccessFlagBits {
    VK_ACCESS_INDIRECT_COMMAND_READ_BIT = 0x00000001,
    VK_ACCESS_INDEX_READ_BIT = 0x00000002,
    VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT = 0x00000004,
    VK_ACCESS_UNIFORM_READ_BIT = 0x00000008,
    VK_ACCESS_INPUT_ATTACHMENT_READ_BIT = 0x00000010,
    VK_ACCESS_SHADER_READ_BIT = 0x00000020,
    VK_ACCESS_SHADER_WRITE_BIT = 0x00000040,
    VK_ACCESS_COLOR_ATTACHMENT_READ_BIT = 0x00000080,
    VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT = 0x00000100,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT = 0x00000200,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT = 0x00000400,
    VK_ACCESS_TRANSFER_READ_BIT = 0x00000800,
    VK_ACCESS_TRANSFER_WRITE_BIT = 0x00001000,
    VK_ACCESS_HOST_READ_BIT = 0x00002000,
    VK_ACCESS_HOST_WRITE_BIT = 0x00004000,
    VK_ACCESS_MEMORY_READ_BIT = 0x00008000,
    VK_ACCESS_MEMORY_WRITE_BIT = 0x00010000,
    VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT = 0x02000000,
    VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT = 0x04000000,
    VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT = 0x08000000,
    VK_ACCESS_CONDITIONAL_RENDERING_READ_BIT_EXT = 0x00100000,
    VK_ACCESS_COMMAND_PROCESS_READ_BIT_NVX = 0x00020000,
    VK_ACCESS_COMMAND_PROCESS_WRITE_BIT_NVX = 0x00040000,
    VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT = 0x00080000,
    VK_ACCESS_SHADING_RATE_IMAGE_READ_BIT_NV = 0x00800000,
    VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_NV = 0x00200000,
    VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_NV = 0x00400000,
    VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT = 0x01000000,
    VK_ACCESS_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkAccessFlagBits;

```

- **VK\_ACCESS\_INDIRECT\_COMMAND\_READ\_BIT** specifies read access to indirect command data read as part of an indirect drawing or dispatch command.
- **VK\_ACCESS\_INDEX\_READ\_BIT** specifies read access to an index buffer as part of an indexed drawing command, bound by [vkCmdBindIndexBuffer](#).
- **VK\_ACCESS\_VERTEX\_ATTRIBUTE\_READ\_BIT** specifies read access to a vertex buffer as part of a drawing command, bound by [vkCmdBindVertexBuffers](#).
- **VK\_ACCESS\_UNIFORM\_READ\_BIT** specifies read access to a [uniform buffer](#).
- **VK\_ACCESS\_INPUT\_ATTACHMENT\_READ\_BIT** specifies read access to an [input attachment](#) within a render pass during fragment shading.
- **VK\_ACCESS\_SHADER\_READ\_BIT** specifies read access to a [storage buffer](#), [physical storage buffer](#), [uniform texel buffer](#), [storage texel buffer](#), [sampled image](#), or [storage image](#).
- **VK\_ACCESS\_SHADER\_WRITE\_BIT** specifies write access to a [storage buffer](#), [physical storage buffer](#), [storage texel buffer](#), or [storage image](#).
- **VK\_ACCESS\_COLOR\_ATTACHMENT\_READ\_BIT** specifies read access to a [color attachment](#), such as via

blending, logic operations, or via certain [subpass load operations](#). It does not include advanced blend operations.

- `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT` specifies write access to a [color](#), [resolve](#), or [depth/stencil resolve attachment](#) during a [render pass](#) or via certain [subpass load and store operations](#).
- `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT` specifies read access to a [depth/stencil attachment](#), via [depth](#) or [stencil operations](#) or via certain [subpass load and store operations](#).
- `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT` specifies write access to a [depth/stencil attachment](#), via [depth](#) or [stencil operations](#) or via certain [subpass load and store operations](#).
- `VK_ACCESS_TRANSFER_READ_BIT` specifies read access to an image or buffer in a [copy](#) operation.
- `VK_ACCESS_TRANSFER_WRITE_BIT` specifies write access to an image or buffer in a [clear](#) or [copy](#) operation.
- `VK_ACCESS_HOST_READ_BIT` specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory.
- `VK_ACCESS_HOST_WRITE_BIT` specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory.
- `VK_ACCESS_MEMORY_READ_BIT` specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all `READ` access flags that are valid where it is used.
- `VK_ACCESS_MEMORY_WRITE_BIT` specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all `WRITE` access flags that are valid where it is used.
- `VK_ACCESS_CONDITIONAL_RENDERING_READ_BIT_EXT` specifies read access to a predicate as part of conditional rendering.
- `VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT` specifies write access to a transform feedback buffer made when transform feedback is active.
- `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT` specifies read access to a transform feedback counter buffer which is read when `vkCmdBeginTransformFeedbackEXT` executes.
- `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT` specifies write access to a transform feedback counter buffer which is written when `vkCmdEndTransformFeedbackEXT` executes.
- `VK_ACCESS_COMMAND_PROCESS_READ_BIT_NVX` specifies reads from `VkBuffer` inputs to `vkCmdProcessCommandsNVX`.
- `VK_ACCESS_COMMAND_PROCESS_WRITE_BIT_NVX` specifies writes to the target command buffer in `vkCmdProcessCommandsNVX`.
- `VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT` is similar to `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`, but also includes [advanced blend operations](#).
- `VK_ACCESS_SHADING_RATE_IMAGE_READ_BIT_NV` specifies read access to a shading rate image as part of a drawing command, as bound by `vkCmdBindShadingRateImageNV`.
- `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_NV` specifies read access to an acceleration structure as part of a trace or build command.
- `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_NV` specifies write access to an acceleration structure as part of a build command.
- `VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT` specifies read access to a [fragment density map](#)

## attachment during dynamic fragment density map operations

Certain access types are only performed by a subset of pipeline stages. Any synchronization command that takes both stage masks and access masks uses both to define the [access scopes](#) - only the specified access types performed by the specified stages are included in the access scope. An application **must** not specify an access flag in a synchronization command if it does not include a pipeline stage in the corresponding stage mask that is able to perform accesses of that type. The following table lists, for each access flag, which pipeline stages **can** perform that type of access.

Table 4. Supported access types

Access flag	Supported pipeline stages
<code>VK_ACCESS_INDIRECT_COMMAND_READ_BIT</code>	<code>VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT</code>
<code>VK_ACCESS_INDEX_READ_BIT</code>	<code>VK_PIPELINE_STAGE_VERTEX_INPUT_BIT</code>
<code>VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT</code>	<code>VK_PIPELINE_STAGE_VERTEX_INPUT_BIT</code>
<code>VK_ACCESS_UNIFORM_READ_BIT</code>	<code>VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV</code> , <code>VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV</code> , <code>VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_NV</code> , <code>VK_PIPELINE_STAGE_VERTEX_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT</code> , or <code>VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT</code>
<code>VK_ACCESS_SHADER_READ_BIT</code>	<code>VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV</code> , <code>VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV</code> , <code>VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_NV</code> , <code>VK_PIPELINE_STAGE_VERTEX_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT</code> , or <code>VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT</code>
<code>VK_ACCESS_SHADER_WRITE_BIT</code>	<code>VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV</code> , <code>VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV</code> , <code>VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_NV</code> , <code>VK_PIPELINE_STAGE_VERTEX_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT</code> , <code>VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT</code> , or <code>VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT</code>
<code>VK_ACCESS_INPUT_ATTACHMENT_READ_BIT</code>	<code>VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT</code>
<code>VK_ACCESS_COLOR_ATTACHMENT_READ_BIT</code>	<code>VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT</code>
<code>VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT</code>	<code>VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT</code>
<code>VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT</code>	<code>VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT</code> , or <code>VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT</code>

Access flag	Supported pipeline stages
<code>VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT</code>	<code>VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT</code> , or <code>VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT</code>
<code>VK_ACCESS_TRANSFER_READ_BIT</code>	<code>VK_PIPELINE_STAGE_TRANSFER_BIT</code>
<code>VK_ACCESS_TRANSFER_WRITE_BIT</code>	<code>VK_PIPELINE_STAGE_TRANSFER_BIT</code>
<code>VK_ACCESS_HOST_READ_BIT</code>	<code>VK_PIPELINE_STAGE_HOST_BIT</code>
<code>VK_ACCESS_HOST_WRITE_BIT</code>	<code>VK_PIPELINE_STAGE_HOST_BIT</code>
<code>VK_ACCESS_MEMORY_READ_BIT</code>	Any
<code>VK_ACCESS_MEMORY_WRITE_BIT</code>	Any
<code>VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT</code>	<code>VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT</code>
<code>VK_ACCESS_COMMAND_PROCESS_READ_BIT_NVX</code>	<code>VK_PIPELINE_STAGE_COMMAND_PROCESS_BIT_NVX</code>

<code>VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_NV</code>	<code>VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_NV</code>
<code>VK_ACCESS_FRAGMENT_DENSITY_MAP_READ_BIT_EXT</code>	<code>VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT</code>

If a memory object does not have the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` property, then `vkFlushMappedMemoryRanges` **must** be called in order to guarantee that writes to the memory object from the host are made available to the host domain, where they **can** be further made available to the device domain via a domain operation. Similarly, `vkInvalidateMappedMemoryRanges` **must** be called to guarantee that writes which are available to the host domain are made visible to host operations.

If the memory object does have the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` property flag, writes to the memory object from the host are automatically made available to the host domain. Similarly, writes made available to the host domain are automatically made visible to the host.

#### Note

The `vkQueueSubmit` command **automatically performs a domain operation from host to device** for all writes performed before the command executes, so in most cases an explicit memory barrier is not needed for this case. In the few circumstances where a submit does not occur between the host write and the device read access, writes **can** be made available by using an explicit memory barrier.

```
typedef VkFlags VkAccessFlags;
```

`VkAccessFlags` is a bitmask type for setting a mask of zero or more `VkAccessFlagBits`.

### 6.1.4. Framebuffer Region Dependencies

Pipeline stages that operate on, or with respect to, the framebuffer are collectively the *framebuffer-space* pipeline stages. These stages are:

- `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT`
- `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT`
- `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`

For these pipeline stages, an execution or memory dependency from the first set of operations to the second set **can** either be a single *framebuffer-global* dependency, or split into multiple *framebuffer-local* dependencies. A dependency with non-framebuffer-space pipeline stages is neither framebuffer-global nor framebuffer-local.

A *framebuffer region* is a set of sample (x, y, layer, sample) coordinates that is a subset of the entire framebuffer.

Both *synchronization scopes* of a framebuffer-local dependency include only the operations performed within corresponding framebuffer regions (as defined below). No ordering guarantees are made between different framebuffer regions for a framebuffer-local dependency.

Both *synchronization scopes* of a framebuffer-global dependency include operations on all framebuffer-regions.

If the first synchronization scope includes operations on pixels/fragments with N samples and the second synchronization scope includes operations on pixels/fragments with M samples, where N does not equal M, then a framebuffer region containing all samples at a given (x, y, layer) coordinate in the first synchronization scope corresponds to a region containing all samples at the same coordinate in the second synchronization scope. In other words, it is a pixel granularity dependency. If N equals M, then a framebuffer region containing a single (x, y, layer, sample) coordinate in the first synchronization scope corresponds to a region containing the same sample at the same coordinate in the second synchronization scope. In other words, it is a sample granularity dependency.

*Note*

Since fragment invocations are not specified to run in any particular groupings, the size of a framebuffer region is implementation-dependent, not known to the application, and **must** be assumed to be no larger than specified above.

*Note*

Practically, the pixel vs sample granularity dependency means that if an input attachment has a different number of samples than the pipeline's `rasterizationSamples`, then a fragment **can** access any sample in the input attachment's pixel even if it only uses framebuffer-local dependencies. If the input attachment has the same number of samples, then the fragment **can** only access the covered samples in its input `SampleMask` (i.e. the fragment operations happen-after a framebuffer-local dependency for each sample the fragment covers). To access samples that are not covered, a framebuffer-global dependency is required.

If a synchronization command includes a `dependencyFlags` parameter, and specifies the `VK_DEPENDENCY_BY_REGION_BIT` flag, then it defines framebuffer-local dependencies for the framebuffer-space pipeline stages in that synchronization command, for all framebuffer regions. If no `dependencyFlags` parameter is included, or the `VK_DEPENDENCY_BY_REGION_BIT` flag is not specified, then a framebuffer-global dependency is specified for those stages. The `VK_DEPENDENCY_BY_REGION_BIT` flag does not affect the dependencies between non-framebuffer-space pipeline stages, nor does it affect the dependencies between framebuffer-space and non-framebuffer-space pipeline stages.

*Note*

Framebuffer-local dependencies are more optimal for most architectures; particularly tile-based architectures - which can keep framebuffer-regions entirely in on-chip registers and thus avoid external bandwidth across such a dependency. Including a framebuffer-global dependency in your rendering will usually force all implementations to flush data to memory, or to a higher level cache, breaking any potential locality optimizations.

### 6.1.5. View-Local Dependencies

In a render pass instance that has `multiview` enabled, dependencies **can** be either view-local or view-global.

A view-local dependency only includes operations from a single `source view` from the source subpass in the first synchronization scope, and only includes operations from a single `destination view` from the destination subpass in the second synchronization scope. A view-global dependency includes all views in the view mask of the source and destination subpasses in the corresponding synchronization scopes.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag, then it defines view-local dependencies for that synchronization command, for all views. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag is not specified, then a view-global dependency is specified.

### 6.1.6. Device-Local Dependencies

Dependencies **can** be either device-local or non-device-local. A device-local dependency acts as multiple separate dependencies, one for each physical device that executes the synchronization

command, where each dependency only includes operations from that physical device in both synchronization scopes. A non-device-local dependency is a single dependency where both synchronization scopes include operations from all physical devices that participate in the synchronization command. For subpass dependencies, all physical devices in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` participate in the dependency, and for pipeline barriers all physical devices that are set in the command buffer's current device mask participate in the dependency.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag, then it defines a non-device-local dependency for that synchronization command. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag is not specified, then it defines device-local dependencies for that synchronization command, for all participating physical devices.

Semaphore and event dependencies are device-local and only execute on the one physical device that performs the dependency.

## 6.2. Implicit Synchronization Guarantees

A small number of implicit ordering guarantees are provided by Vulkan, ensuring that the order in which commands are submitted is meaningful, and avoiding unnecessary complexity in common operations.

*Submission order* is a fundamental ordering in Vulkan, giving meaning to the order in which [action](#) and [synchronization commands](#) are recorded and submitted to a single queue. Explicit and implicit ordering guarantees between commands in Vulkan all work on the premise that this ordering is meaningful. This order does not itself define any execution or memory dependencies; synchronization commands and other orderings within the API use this ordering to define their scopes.

Submission order for any given set of commands is based on the order in which they were recorded to command buffers and then submitted. This order is determined as follows:

1. The initial order is determined by the order in which `vkQueueSubmit` commands are executed on the host, for a single queue, from first to last.
2. The order in which `VkSubmitInfo` structures are specified in the `pSubmits` parameter of `vkQueueSubmit`, from lowest index to highest.
3. The order in which command buffers are specified in the `pCommandBuffers` member of `VkSubmitInfo`, from lowest index to highest.
4. The order in which commands were recorded to a command buffer on the host, from first to last:
  - For commands recorded outside a render pass, this includes all other commands recorded outside a render pass, including `vkCmdBeginRenderPass` and `vkCmdEndRenderPass` commands; it does not directly include commands inside a render pass.
  - For commands recorded inside a render pass, this includes all other commands recorded inside the same subpass, including the `vkCmdBeginRenderPass` and `vkCmdEndRenderPass` commands that delimit the same render pass instance; it does not include commands

recorded to other subpasses.

Action and synchronization commands recorded to a command buffer execute the `VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT` pipeline stage in submission order - forming an implicit execution dependency between this stage in each command.

State commands do not execute any operations on the device, instead they set the state of the command buffer when they execute on the host, in the order that they are recorded. Action commands consume the current state of the command buffer when they are recorded, and will execute state changes on the device as required to match the recorded state.

Query commands, the order of primitives passing through the graphics pipeline and image layout transitions as part of an image memory barrier provide additional guarantees based on submission order.

Execution of pipeline stages within a given command also has a loose ordering, dependent only on a single command.

*Signal operation order* is a fundamental ordering in Vulkan, giving meaning to the order in which semaphore and fence signal operations occur when submitted to a single queue. The signal operation order for queue operations is determined as follows:

1. The initial order is determined by the order in which `vkQueuePresentKHR`, `vkQueueSubmit`, and `vkQueueBindSparse` commands are executed on the host, for a single queue, from first to last.
2. The order in which `VkSubmitInfo` structures are specified in the `pSubmits` parameter of `vkQueueSubmit`, from lowest index to highest.
3. The fence signal operation defined by the `fence` parameter of a `vkQueueSubmit` or `vkQueueBindSparse` command is ordered after all semaphore signal operations defined by that command.

Semaphore signal operations defined by a single `VkSubmitInfo` or `VkBindSparseInfo` structure are unordered with respect to other semaphore signal operations defined within the same `VkSubmitInfo` or `VkBindSparseInfo` structure.

The `vkSignalSemaphoreKHR` command does not execute on a queue but instead performs the signal operation from the host. The semaphore signal operation defined by executing a `vkSignalSemaphoreKHR` command happens-after the `vkSignalSemaphoreKHR` command is invoked and happens-before the command returns.

### Note

When signaling timeline semaphores, it is the responsibility of the client to ensure that they are ordered such that the semaphore value is strictly increasing. Because the first synchronization scope for a semaphore signal operation contains all semaphore signal operations which occur earlier in submission order, all semaphore signal operations contained in any given batch are guaranteed to happen-after all semaphore signal operations contained in any previous batches. However, no ordering guarantee is provided between the semaphore signal operations defined within a single batch. This, combined with the requirement that timeline semaphore values strictly increase, means that it is invalid to signal the same timeline semaphore twice within a single batch.

If a client wishes to ensure that some semaphore signal operation happens-after some other semaphore signal operation, it can submit a separate batch containing only semaphore signal operations, which will happen-after the semaphore signal operations in any earlier batches.

When signaling a semaphore from the host, the only ordering guarantee is that the signal operation happens-after when `vkSignalSemaphoreKHR` is called and happens-before it returns. Therefore, it is invalid to call `vkSignalSemaphoreKHR` while there are any outstanding signal operations on that semaphore from any queue submissions unless those queue submissions have some dependency which ensures that they happen-after the host signal operation. One example of this would be if the pending signal operation is, itself, waiting on the same semaphore at a lower value and the call to `vkSignalSemaphoreKHR` signals that lower value. Furthermore, if there are two or more processes or threads signaling the same timeline semaphore from the host, the client must ensure that the `vkSignalSemaphoreKHR` with the lower semaphore value returns before `vkSignalSemaphoreKHR` is called with the higher value.

## 6.3. Fences

Fences are a synchronization primitive that **can** be used to insert a dependency from a queue to the host. Fences have two states - signaled and unsignaled. A fence **can** be signaled as part of the execution of a `queue submission` command. Fences **can** be unsignaled on the host with `vkResetFences`. Fences **can** be waited on by the host with the `vkWaitForFences` command, and the current state **can** be queried with `vkGetFenceStatus`.

As with most objects in Vulkan, fences are an interface to internal data which is typically opaque to applications. This internal data is referred to as a fence's *payload*.

However, in order to enable communication with agents outside of the current device, it is necessary to be able to export that payload to a commonly understood format, and subsequently import from that format as well.

The internal data of a fence **may** include a reference to any resources and pending work associated with signal or unsignal operations performed on that fence object. Mechanisms to import and export that internal data to and from fences are provided [below](#). These mechanisms indirectly

enable applications to share fence state between two or more fences and other synchronization primitives across process and API boundaries.

Fences are represented by `VkFence` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFence)
```

To create a fence, call:

```
VkResult vkCreateFence(  
    VkDevice device,  
    const VkFenceCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkFence* pFence);
```

- `device` is the logical device that creates the fence.
- `pCreateInfo` is a pointer to a `VkFenceCreateInfo` structure containing information about how the fence is to be created.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pFence` is a pointer to a handle in which the resulting fence object is returned.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkFenceCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pFence` **must** be a valid pointer to a `VkFence` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkFenceCreateInfo` structure is defined as:

```
typedef struct VkFenceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFenceCreateFlags flags;
} VkFenceCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is a bitmask of `VkFenceCreateFlagBits` specifying the initial state and behavior of the fence.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_FENCE_CREATE_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkExportFenceCreateInfo` or `VkExportFenceWin32HandleInfoKHR`
- Each `sType` member in the `pNext` chain **must** be unique
- `flags` **must** be a valid combination of `VkFenceCreateFlagBits` values

```
typedef enum VkFenceCreateFlagBits {
    VK_FENCE_CREATE_SIGNALED_BIT = 0x00000001,
    VK_FENCE_CREATE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkFenceCreateFlagBits;
```

- `VK_FENCE_CREATE_SIGNALED_BIT` specifies that the fence object is created in the signaled state. Otherwise, it is created in the unsignaled state.

```
typedef VkFlags VkFenceCreateFlags;
```

`VkFenceCreateFlags` is a bitmask type for setting a mask of zero or more `VkFenceCreateFlagBits`.

To create a fence whose payload **can** be exported to external handles, add the `VkExportFenceCreateInfo` structure to the `pNext` chain of the `VkFenceCreateInfo` structure. The `VkExportFenceCreateInfo` structure is defined as:

```
typedef struct VkExportFenceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalFenceHandleTypeFlags handleTypes;
} VkExportFenceCreateInfo;
```

or the equivalent

```
typedef VkExportFenceCreateInfo VkExportFenceCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `handleTypes` is a bitmask of `VkExternalFenceHandleTypeFlagBits` specifying one or more fence handle types the application **can** export from the resulting fence. The application **can** request multiple handle types for the same fence.

## Valid Usage

- The bits in `handleTypes` must be supported and compatible, as reported by `VkExternalFenceProperties`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_FENCE_CREATE_INFO`
- `handleTypes` **must** be a valid combination of `VkExternalFenceHandleTypeFlagBits` values

To specify additional attributes of NT handles exported from a fence, add the `VkExportFenceWin32HandleInfoKHR` structure to the `pNext` chain of the `VkFenceCreateInfo` structure. The `VkExportFenceWin32HandleInfoKHR` structure is defined as:

```
typedef struct VkExportFenceWin32HandleInfoKHR {
    VkStructureType          sType;
    const void*               pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD                    dwAccess;
    LPCWSTR                  name;
} VkExportFenceWin32HandleInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- `dwAccess` is a `DWORD` specifying access rights of the handle.
- `name` is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created fence.

If this structure is not present, or if `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in

the MSDN documentation for “Synchronization Object Security and Access Rights”<sup>1</sup>. Further, if the structure is not present, the access rights will be

`DXGI_SHARED_RESOURCE_READ | DXGI_SHARED_RESOURCE_WRITE`

for handles of the following types:

`VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT`

**1**

<https://docs.microsoft.com/en-us/windows/win32/sync/synchronization-object-security-and-access-rights>

## Valid Usage

- If `VkExportFenceCreateInfo::handleTypes` does not include `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VkExportFenceWin32HandleInfoKHR` **must** not be in the `pNext` chain of `VkFenceCreateInfo`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_FENCE_WIN32_HANDLE_INFO_KHR`
- If `pAttributes` is not `NULL`, `pAttributes` **must** be a valid pointer to a valid `SECURITY_ATTRIBUTES` value

To export a Windows handle representing the state of a fence, call:

```
VkResult vkGetFenceWin32HandleKHR(  
    VkDevice device,  
    const VkFenceGetWin32HandleInfoKHR* pGetWin32HandleInfo,  
    HANDLE* pHandle);
```

- `device` is the logical device that created the fence being exported.
- `pGetWin32HandleInfo` is a pointer to a `VkFenceGetWin32HandleInfoKHR` structure containing parameters of the export operation.
- `pHandle` will return the Windows handle representing the fence state.

For handle types defined as NT handles, the handles returned by `vkGetFenceWin32HandleKHR` are owned by the application. To avoid leaking resources, the application **must** release ownership of them using the `CloseHandle` system call when they are no longer needed.

Exporting a Windows handle from a fence **may** have side effects depending on the transference of the specified handle type, as described in [Importing Fence Payloads](#).

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pGetWin32HandleInfo` **must** be a valid pointer to a valid `VkFenceGetWin32HandleInfoKHR` structure
- `pHandle` **must** be a valid pointer to a `HANDLE` value

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkFenceGetWin32HandleInfoKHR` structure is defined as:

```
typedef struct VkFenceGetWin32HandleInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkFence                  fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetWin32HandleInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `fence` is the fence from which state will be exported.
- `handleType` is the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalFenceHandleTypeFlagBits` for a description of the properties of the defined external fence handle types.

## Valid Usage

- `handleType` **must** have been included in `VkExportFenceCreateInfo::handleTypes` when the `fence`'s current payload was created.
- If `handleType` is defined as an NT handle, `vkGetFenceWin32HandleKHR` **must** be called no more than once for each valid unique combination of `fence` and `handleType`.
- `fence` **must** not currently have its payload replaced by an imported payload as described below in [Importing Fence Payloads](#) unless that imported payload's handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for `handleType`.
- If `handleType` refers to a handle type with copy payload transference semantics, `fence` **must** be signaled, or have an associated [fence signal operation](#) pending execution.
- `handleType` **must** be defined as an NT handle or a global share handle.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_FENCE_GET_WIN32_HANDLE_INFO_KHR`
- `pNext` **must** be `NULL`
- `fence` **must** be a valid `VkFence` handle
- `handleType` **must** be a valid `VkExternalFenceHandleTypeFlagBits` value

To export a POSIX file descriptor representing the payload of a fence, call:

```
VkResult vkGetFenceFdKHR(  
    VkDevice device,  
    const VkFenceGetFdInfoKHR* pGetFdInfo,  
    int* pFd);
```

- `device` is the logical device that created the fence being exported.
- `pGetFdInfo` is a pointer to a `VkFenceGetFdInfoKHR` structure containing parameters of the export operation.
- `pFd` will return the file descriptor representing the fence payload.

Each call to `vkGetFenceFdKHR` **must** create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application **must** release ownership of the file descriptor when it is no longer needed.

### Note

Ownership can be released in many ways. For example, the application can call `close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a fence payload.

If `pGetFdInfo->handleType` is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` and the fence is signaled at the time `vkGetFenceFdKHR` is called, `pFd` **may** return the value `-1` instead of a valid file descriptor.

Where supported by the operating system, the implementation **must** set the file descriptor to be closed automatically when an `execve` system call is made.

Exporting a file descriptor from a fence **may** have side effects depending on the transference of the specified handle type, as described in [Importing Fence State](#).

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pGetFdInfo` **must** be a valid pointer to a valid `VkFenceGetFdInfoKHR` structure
- `pFd` **must** be a valid pointer to an `int` value

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkFenceGetFdInfoKHR` structure is defined as:

```
typedef struct VkFenceGetFdInfoKHR {
    VkStructureType           sType;
    const void*                pNext;
    VkFence                    fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetFdInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `fence` is the fence from which state will be exported.
- `handleType` is the type of handle requested.

The properties of the file descriptor returned depend on the value of `handleType`. See `VkExternalFenceHandleTypeFlagBits` for a description of the properties of the defined external fence handle types.

## Valid Usage

- `handleType` **must** have been included in `VkExportFenceCreateInfo::handleTypes` when `fence`'s current payload was created.
- If `handleType` refers to a handle type with copy payload transference semantics, `fence` **must** be signaled, or have an associated `fence signal operation` pending execution.
- `fence` **must** not currently have its payload replaced by an imported payload as described below in [Importing Fence Payloads](#) unless that imported payload's handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for `handleType`.
- `handleType` **must** be defined as a POSIX file descriptor handle.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_FENCE_GET_FD_INFO_KHR`
- `pNext` **must** be `NULL`
- `fence` **must** be a valid `VkFence` handle
- `handleType` **must** be a valid `VkExternalFenceHandleTypeFlagBits` value

To destroy a fence, call:

```
void vkDestroyFence(  
    VkDevice device,  
    VkFence fence,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the fence.
- `fence` is the handle of the fence to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- All `queue submission` commands that refer to `fence` **must** have completed execution
- If `VkAllocationCallbacks` were provided when `fence` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `fence` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be a valid `VkFence` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `fence` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `fence` **must** be externally synchronized

To query the status of a fence from the host, call:

```
VkResult vkGetFenceStatus(  
    VkDevice device,  
    VkFence fence);
```

- `device` is the logical device that owns the fence.
- `fence` is the handle of the fence to query.

Upon success, `vkGetFenceStatus` returns the status of the fence object, with the following return codes:

*Table 5. Fence Object Status Codes*

Status	Meaning
<code>VK_SUCCESS</code>	The fence specified by <code>fence</code> is signaled.
<code>VK_NOT_READY</code>	The fence specified by <code>fence</code> is unsignaled.
<code>VK_ERROR_DEVICE_LOST</code>	The device has been lost. See <a href="#">Lost Device</a> .

If a `queue submission` command is pending execution, then the value returned by this command **may** immediately be out of date.

If the device has been lost (see [Lost Device](#)), `vkGetFenceStatus` **may** return any of the above status codes. If the device has been lost and `vkGetFenceStatus` is called repeatedly, it will eventually return either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `fence` **must** be a valid `VkFence` handle
- `fence` **must** have been created, allocated, or retrieved from `device`

## Return Codes

### Success

- `VK_SUCCESS`
- `VK_NOT_READY`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

To set the state of fences to unsignaled from the host, call:

```
VkResult vkResetFences(  
    VkDevice                      device,  
    uint32_t                      fenceCount,  
    const VkFence*                pFences);
```

- `device` is the logical device that owns the fences.
- `fenceCount` is the number of fences to reset.
- `pFences` is a pointer to an array of fence handles to reset.

If any member of `pFences` currently has its [payload imported](#) with temporary permanence, that fence's prior permanent payload is first restored. The remaining operations described therefore operate on the restored payload.

When `vkResetFences` is executed on the host, it defines a *fence unsignal operation* for each fence, which resets the fence to the unsignaled state.

If any member of `pFences` is already in the unsignaled state when `vkResetFences` is executed, then `vkResetFences` has no effect on that fence.

## Valid Usage

- Each element of `pFences` **must** not be currently associated with any queue command that has not yet completed execution on that queue

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pFences` **must** be a valid pointer to an array of `fenceCount` valid `VkFence` handles
- `fenceCount` **must** be greater than `0`
- Each element of `pFences` **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to each member of `pFences` **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

When a fence is submitted to a queue as part of a [queue submission](#) command, it defines a memory dependency on the batches that were submitted as part of that command, and defines a *fence signal operation* which sets the fence to the signaled state.

The first [synchronization scope](#) includes every batch submitted in the same [queue submission](#) command. Fence signal operations that are defined by `vkQueueSubmit` additionally include in the first synchronization scope all commands that occur earlier in [submission order](#). Fence signal operations that are defined by `vkQueueSubmit` or `vkQueueBindSparse` additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in [signal operation order](#).

The second [synchronization scope](#) only includes the fence signal operation.

The first [access scope](#) includes all memory access performed by the device.

The second [access scope](#) is empty.

To wait for one or more fences to enter the signaled state on the host, call:

```
VkResult vkWaitForFences(  
    VkDevice device,  
    uint32_t fenceCount,  
    const VkFence* pFences,  
    VkBool32 waitAll,  
    uint64_t timeout);
```

- `device` is the logical device that owns the fences.
- `fenceCount` is the number of fences to wait on.
- `pFences` is a pointer to an array of `fenceCount` fence handles.
- `waitAll` is the condition that **must** be satisfied to successfully unblock the wait. If `waitAll` is `VK_TRUE`, then the condition is that all fences in `pFences` are signaled. Otherwise, the condition is that at least one fence in `pFences` is signaled.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

If the condition is satisfied when `vkWaitForFences` is called, then `vkWaitForFences` returns immediately. If the condition is not satisfied at the time `vkWaitForFences` is called, then `vkWaitForFences` will block and wait up to `timeout` nanoseconds for the condition to become satisfied.

If `timeout` is zero, then `vkWaitForFences` does not wait, but simply returns the current state of the fences. `VK_TIMEOUT` will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the specified timeout period expires before the condition is satisfied, `vkWaitForFences` returns `VK_TIMEOUT`. If the condition is satisfied before `timeout` nanoseconds has expired, `vkWaitForFences` returns `VK_SUCCESS`.

If device loss occurs (see [Lost Device](#)) before the timeout has expired, `vkWaitForFences` **must** return in finite time with either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

*Note*

While we guarantee that `vkWaitForFences` **must** return in finite time, no guarantees are made that it returns immediately upon device loss. However, the client can reasonably expect that the delay will be on the order of seconds and that calling `vkWaitForFences` will not result in a permanently (or seemingly permanently) dead process.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pFences` **must** be a valid pointer to an array of `fenceCount` valid `VkFence` handles
- `fenceCount` **must** be greater than `0`
- Each element of `pFences` **must** have been created, allocated, or retrieved from `device`

## Return Codes

### Success

- `VK_SUCCESS`
- `VK_TIMEOUT`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

An execution dependency is defined by waiting for a fence to become signaled, either via `vkWaitForFences` or by polling on `vkGetFenceStatus`.

The first [synchronization scope](#) includes only the fence signal operation.

The second [synchronization scope](#) includes the host operations of `vkWaitForFences` or `vkGetFenceStatus` indicating that the fence has become signaled.

#### Note

Signaling a fence and waiting on the host does not guarantee that the results of memory accesses will be visible to the host, as the access scope of a memory dependency defined by a fence only includes device access. A [memory barrier](#) or other memory dependency **must** be used to guarantee this. See the description of [host access types](#) for more information.

### 6.3.1. Alternate Methods to Signal Fences

Besides submitting a fence to a queue as part of a [queue submission](#) command, a fence **may** also be signaled when a particular event occurs on a device or display.

To create a fence that will be signaled when an event occurs on a device, call:

```

VkResult vkRegisterDeviceEventEXT(
    VkDevice device,
    const VkDeviceEventInfoEXT* pDeviceEventInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFence* pFence);

```

- `device` is a logical device on which the event **may** occur.
- `pDeviceEventInfo` is a pointer to a `VkDeviceEventInfoEXT` structure describing the event of interest to the application.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pFence` is a pointer to a handle in which the resulting fence object is returned.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pDeviceEventInfo` **must** be a valid pointer to a valid `VkDeviceEventInfoEXT` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pFence` **must** be a valid pointer to a `VkFence` handle

## Return Codes

### Success

- `VK_SUCCESS`

The `VkDeviceEventInfoEXT` structure is defined as:

```

typedef struct VkDeviceEventInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceEventTypeEXT deviceEvent;
} VkDeviceEventInfoEXT;

```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `device` is a `VkDeviceEventTypeEXT` value specifying when the fence will be signaled.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_EVENT_INFO_EXT`
- `pNext` **must** be `NULL`
- `deviceEvent` **must** be a valid `VkDeviceEventTypeEXT` value

Possible values of `VkDeviceEventInfoEXT::device`, specifying when a fence will be signaled, are:

```
typedef enum VkDeviceEventTypeEXT {
    VK_DEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT = 0,
    VK_DEVICE_EVENT_TYPE_MAX_ENUM_EXT = 0x7FFFFFFF
} VkDeviceEventTypeEXT;
```

- `VK_DEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT` specifies that the fence is signaled when a display is plugged into or unplugged from the specified device. Applications **can** use this notification to determine when they need to re-enumerate the available displays on a device.

To create a fence that will be signaled when an event occurs on a `VkDisplayKHR` object, call:

```
VkResult vkRegisterDisplayEventEXT(
    VkDevice                                     device,
    VkDisplayKHR                                display,
    const VkDisplayEventCreateInfo*               pDisplayCreateInfo,
    const VkAllocationCallbacks*                 pAllocator,
    VkFence*                                    pFence);
```

- `device` is a logical device associated with `display`
- `display` is the display on which the event **may** occur.
- `pDisplayCreateInfo` is a pointer to a `VkDisplayEventCreateInfoEXT` structure describing the event of interest to the application.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pFence` is a pointer to a handle in which the resulting fence object is returned.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `display` **must** be a valid `VkDisplayKHR` handle
- `pDisplayCreateInfo` **must** be a valid pointer to a valid `VkDisplayEventCreateInfoEXT` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pFence` **must** be a valid pointer to a `VkFence` handle

## Return Codes

### Success

- `VK_SUCCESS`

The `VkDisplayEventInfoEXT` structure is defined as:

```
typedef struct VkDisplayEventInfoEXT {
    VkStructureType         sType;
    const void*             pNext;
    VkDisplayEventTypeEXT   displayEvent;
} VkDisplayEventInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `displayEvent` is a `VkDisplayEventTypeEXT` specifying when the fence will be signaled.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_EVENT_INFO_EXT`
- `pNext` **must** be `NULL`
- `displayEvent` **must** be a valid `VkDisplayEventTypeEXT` value

Possible values of `VkDisplayEventInfoEXT::displayEvent`, specifying when a fence will be signaled, are:

```
typedef enum VkDisplayEventTypeEXT {
    VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT = 0,
    VK_DISPLAY_EVENT_TYPE_MAX_ENUM_EXT = 0x7FFFFFFF
} VkDisplayEventTypeEXT;
```

- `VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT` specifies that the fence is signaled when the first pixel of the next display refresh cycle leaves the display engine for the display.

### 6.3.2. Importing Fence Payloads

Applications **can** import a fence payload into an existing fence using an external fence handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the fence will be *restored* to its permanent state the next time that fence is passed to `vkResetFences`.

*Note*

Restoring a fence to its prior permanent payload is a distinct operation from resetting a fence payload. See [vkResetFences](#) for more detail.

Performing a subsequent temporary import on a fence before resetting it has no effect on this requirement; the next unsignal of the fence **must** still restore its last permanent state. A permanent payload import behaves as if the target fence was destroyed, and a new fence was created with the same handle but the imported payload. Because importing a fence payload temporarily or permanently detaches the existing payload from a fence, similar usage restrictions to those applied to [vkDestroyFence](#) are applied to any command that imports a fence payload. Which of these import types is used is referred to as the import operation's *permanence*. Each handle type supports either one or both types of permanence.

The implementation **must** perform the import operation by either referencing or copying the payload referred to by the specified external fence handle, depending on the handle's type. The import method used is referred to as the handle type's *transference*. When using handle types with reference transference, importing a payload to a fence adds the fence to the set of all fences sharing that payload. This set includes the fence from which the payload was exported. Fence signaling, waiting, and resetting operations performed on any fence in the set **must** behave as if the set were a single fence. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Fence signaling, waiting, and resetting operations performed on the target of copy imports **must** not affect any other fence or payload.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a fence payload to a handle with copy transference has the same side effects on the source fence's payload as executing a fence reset operation. If the fence was using a temporarily imported payload, the fence's prior permanent payload will be restored.

*Note*

The tables [Handle Types Supported by VkImportFenceWin32HandleInfoKHR](#) and [Handle Types Supported by VkImportFenceFdInfoKHR](#) define the permanence and transference of each handle type.

[External synchronization](#) allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for fences sharing a payload across processes, satisfying the external synchronization requirements of [VkFence](#) parameters as if all fences in the set were the same object is sometimes infeasible. Satisfying valid usage constraints on the state of a fence would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific fence handle, not to its payload. For distinct fence objects which share a payload:

- If multiple commands which queue a signal operation, or which unsignal a fence, are called concurrently, behavior will be as if the commands were called in an arbitrary sequential order.
- If a queue submission command is called with a fence that is sharing a payload, and the payload is already associated with another queue command that has not yet completed execution, either one or both of the commands will cause the fence to become signaled when they complete

execution.

- If a fence payload is reset while it is associated with a queue command that has not yet completed execution, the payload will become unsignaled, but **may** become signaled again when the command completes execution.
- In the preceding cases, any of the devices associated with the fences sharing the payload **may** be lost, or any of the queue submission or fence reset commands **may** return `VK_ERROR_INITIALIZATION_FAILED`.

Other than these non-deterministic results, behavior is well defined. In particular:

- The implementation **must** not crash or enter an internally inconsistent state where future valid Vulkan commands might cause undefined results,
- Timeouts on future wait commands on fences sharing the payload **must** be effective.

*Note*

These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared fence for more than synchronizing access to the shared memory. For example, a process should not use a fence with shared payload to tell when commands it submitted to a queue have completed and objects used by those commands may be destroyed, since the other process can accidentally or maliciously cause the fence to signal before the commands actually complete.

When a fence is using an imported payload, its `VkExportFenceCreateInfo::handleTypes` value is that specified when creating the fence from which the payload was exported, rather than that specified when creating the fence. Additionally, `VkExternalFenceProperties::exportFromImportedHandleTypes` restricts which handle types **can** be exported from such a fence based on the specific handle type used to import the current payload. Passing a fence to `vkAcquireNextImageKHR` is equivalent to temporarily importing a fence payload to that fence.

*Note*

Because the exportable handle types of an imported fence correspond to its current imported payload, and `vkAcquireNextImageKHR` behaves the same as a temporary import operation for which the source fence is opaque to the application, applications have no way of determining whether any external handle types **can** be exported from a fence in this state. Therefore, applications **must** not attempt to export handles from fences using a temporarily imported payload from `vkAcquireNextImageKHR`.

When importing a fence payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations **must** perform sufficient validation of external handles to ensure that the operation results in a valid fence which will not cause program termination, device loss, queue stalls, host thread stalls, or corruption of other resources when used as allowed according to its import parameters. If the external handle provided does not meet these requirements, the implementation **must** fail the fence payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

To import a fence payload from a Windows handle, call:

```
VkResult vkImportFenceWin32HandleKHR(  
    VkDevice device,  
    const VkImportFenceWin32HandleInfoKHR* pImportFenceWin32HandleInfo);
```

- `device` is the logical device that created the fence.
- `pImportFenceWin32HandleInfo` is a pointer to a `VkImportFenceWin32HandleInfoKHR` structure specifying the fence and import parameters.

Importing a fence payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application **must** release ownership using the `CloseHandle` system call when the handle is no longer needed.

Applications **can** import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pImportFenceWin32HandleInfo` **must** be a valid pointer to a `VkImportFenceWin32HandleInfoKHR` structure

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportFenceWin32HandleInfoKHR` structure is defined as:

```
typedef struct VkImportFenceWin32HandleInfoKHR {  
    VkStructureType sType;  
    const void* pNext;  
    VkFence fence;  
    VkFenceImportFlags flags;  
    VkExternalFenceHandleTypeFlagBits handleType;  
    HANDLE handle;  
    LPCWSTR name;  
} VkImportFenceWin32HandleInfoKHR;
```

- `sType` is the type of this structure.

- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `fence` is the fence into which the state will be imported.
- `flags` is a bitmask of `VkFenceImportFlagBits` specifying additional parameters for the fence payload import operation.
- `handleType` specifies the type of `handle`.
- `handle` is the external handle to import, or `NULL`.
- `name` is a null-terminated UTF-16 string naming the underlying synchronization primitive to import, or `NULL`.

The handle types supported by `handleType` are:

*Table 6. Handle Types Supported by `VkImportFenceWin32HandleInfoKHR`*

Handle Type	Transference	Permanence Supported
<code>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT</code>	Reference	Temporary,Permanent
<code>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT</code>	Reference	Temporary,Permanent

## Valid Usage

- `handleType` **must** be a value included in the Handle Types Supported by `VkImportFenceWin32HandleInfoKHR` table.
- If `handleType` is not `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `name` **must** be `NULL`.
- If `handleType` is not `0` and `handle` is `NULL`, `name` **must** name a valid synchronization primitive of the type specified by `handleType`.
- If `handleType` is not `0` and `name` is `NULL`, `handle` **must** be a valid handle of the type specified by `handleType`.
- If `handle` is not `NULL`, `name` must be `NULL`.
- If `handle` is not `NULL`, it **must** obey any requirements listed for `handleType` in [external fence handle types compatibility](#).
- If `name` is not `NULL`, it **must** obey any requirements listed for `handleType` in [external fence handle types compatibility](#).

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_FENCE_WIN32_HANDLE_INFO_KHR`
- `pNext` **must** be `NULL`
- `fence` **must** be a valid `VkFence` handle
- `flags` **must** be a valid combination of `VkFenceImportFlagBits` values
- If `handleType` is not `0`, `handleType` **must** be a valid `VkExternalFenceHandleTypeFlagBits` value

## Host Synchronization

- Host access to `fence` **must** be externally synchronized

To import a fence payload from a POSIX file descriptor, call:

```
VkResult vkImportFenceFdKHR(  
    VkDevice device,  
    const VkImportFenceFdInfoKHR* pImportFenceFdInfo);
```

- `device` is the logical device that created the fence.
- `pImportFenceFdInfo` is a pointer to a `VkImportFenceFdInfoKHR` structure specifying the fence and import parameters.

Importing a fence payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import.

Applications **can** import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

## Valid Usage

- `fence` **must** not be associated with any queue command that has not yet completed execution on that queue

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pImportFenceFdInfo` **must** be a valid pointer to a valid `VkImportFenceFdInfoKHR` structure

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportFenceFdInfoKHR` structure is defined as:

```
typedef struct VkImportFenceFdInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkFence                  fence;
    VkFenceImportFlags        flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    int                      fd;
} VkImportFenceFdInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `fence` is the fence into which the payload will be imported.
- `flags` is a bitmask of `VkFenceImportFlagBits` specifying additional parameters for the fence payload import operation.
- `handleType` specifies the type of `fd`.
- `fd` is the external handle to import.

The handle types supported by `handleType` are:

Table 7. Handle Types Supported by `VkImportFenceFdInfoKHR`

Handle Type	Transference	Permanence Supported
<code>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT</code>	Reference	Temporary,Permanent
<code>VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT</code>	Copy	Temporary

## Valid Usage

- `handleType` **must** be a value included in the Handle Types Supported by `VkImportFenceFdInfoKHR` table.
- `fd` **must** obey any requirements listed for `handleType` in external fence handle types compatibility.

If `handleType` is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT`, the special value `-1` for `fd` is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the `VkFence` will have a temporarily imported payload as if a valid file descriptor had been provided.

*Note*

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a `-1` file descriptor when exporting a `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` from a `VkFence` which is signaled.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_FENCE_FD_INFO_KHR`
- `pNext` **must** be `NULL`
- `fence` **must** be a valid `VkFence` handle
- `flags` **must** be a valid combination of `VkFenceImportFlagBits` values
- `handleType` **must** be a valid `VkExternalFenceHandleTypeFlagBits` value

## Host Synchronization

- Host access to `fence` **must** be externally synchronized

Bits which can be set in `VkImportFenceWin32HandleInfoKHR::flags` and `VkImportFenceFdInfoKHR::flags` specifying additional parameters of a fence import operation are:

```
typedef enum VkFenceImportFlagBits {
    VK_FENCE_IMPORT_TEMPORARY_BIT = 0x00000001,
    VK_FENCE_IMPORT_TEMPORARY_BIT_KHR = VK_FENCE_IMPORT_TEMPORARY_BIT,
    VK_FENCE_IMPORT_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkFenceImportFlagBits;
```

or the equivalent

```
typedef VkFenceImportFlagBits VkFenceImportFlagBitsKHR;
```

- `VK_FENCE_IMPORT_TEMPORARY_BIT` specifies that the fence payload will be imported only temporarily, as described in [Importing Fence Payloads](#), regardless of the permanence of `handleType`.

```
typedef VkFlags VkFenceImportFlags;
```

or the equivalent

```
typedef VkFenceImportFlags VkFenceImportFlagsKHR;
```

[VkFenceImportFlags](#) is a bitmask type for setting a mask of zero or more [VkFenceImportFlagBits](#).

## 6.4. Semaphores

Semaphores are a synchronization primitive that **can** be used to insert a dependency between queue operations or between a queue operation and the host. [Binary semaphores](#) have two states - signaled and unsignaled. [Timeline semaphores](#) have a monotonically increasing 64-bit unsigned integer payload and are signaled with respect to a particular reference value. A semaphore **can** be signaled after execution of a queue operation is completed, and a queue operation **can** wait for a semaphore to become signaled before it begins execution. A timeline semaphore **can** additionally be signaled from the host with the [vkSignalSemaphoreKHR](#) command and waited on from the host with the [vkWaitSemaphoresKHR](#) command.

As with most objects in Vulkan, semaphores are an interface to internal data which is typically opaque to applications. This internal data is referred to as a semaphore's *payload*.

However, in order to enable communication with agents outside of the current device, it is necessary to be able to export that payload to a commonly understood format, and subsequently import from that format as well.

The internal data of a semaphore **may** include a reference to any resources and pending work associated with signal or unsignal operations performed on that semaphore object. Mechanisms to import and export that internal data to and from semaphores are provided [below](#). These mechanisms indirectly enable applications to share semaphore state between two or more semaphores and other synchronization primitives across process and API boundaries.

Semaphores are represented by [VkSemaphore](#) handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSemaphore)
```

To create a semaphore, call:

```
VkResult vkCreateSemaphore(  
    VkDevice                                     device,  
    const VkSemaphoreCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkSemaphore* pSemaphore);
```

- **device** is the logical device that creates the semaphore.

- `pCreateInfo` is a pointer to a `VkSemaphoreCreateInfo` structure containing information about how the semaphore is to be created.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pSemaphore` is a pointer to a handle in which the resulting semaphore object is returned.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkSemaphoreCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pSemaphore` **must** be a valid pointer to a `VkSemaphore` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkSemaphoreCreateInfo` structure is defined as:

```
typedef struct VkSemaphoreCreateInfo {
    VkStructureType          sType;
    const void*               pNext;
    VkSemaphoreCreateFlags     flags;
} VkSemaphoreCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is reserved for future use.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkExportSemaphoreCreateInfo`, `VkExportSemaphoreWin32HandleInfoKHR`, or `VkSemaphoreTypeCreateInfoKHR`
- Each `sType` member in the `pNext` chain must be unique
- `flags` must be `0`

```
typedef VkFlags VkSemaphoreCreateFlags;
```

`VkSemaphoreCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To create a semaphore of a specific type, add the `VkSemaphoreTypeCreateInfoKHR` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkSemaphoreTypeCreateInfoKHR` structure is defined as:

```
typedef struct VkSemaphoreTypeCreateInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    VkSemaphoreTypeKHR   semaphoreType;
    uint64_t              initialValue;
} VkSemaphoreTypeCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `semaphoreType` is a `VkSemaphoreTypeKHR` value specifying the type of the semaphore.
- `initialValue` is the initial payload value if `semaphoreType` is `VK_SEMAPHORE_TYPE_TIMELINE_KHR`.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_TYPE_CREATE_INFO_KHR`
- `semaphoreType` must be a valid `VkSemaphoreTypeKHR` value

## Valid Usage

- If the `timelineSemaphore` feature is not enabled, `semaphoreType` must not equal `VK_SEMAPHORE_TYPE_TIMELINE_KHR`
- If `semaphoreType` is `VK_SEMAPHORE_TYPE_BINARY_KHR`, `initialValue` must be zero.

If no instance of the `VkSemaphoreTypeCreateInfoKHR` structure is present in the `pNext` chain of `VkSemaphoreCreateInfo` then the created semaphore will have a default `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_BINARY_KHR`.

Possible values of `VkSemaphoreTypeCreateInfoKHR::semaphoreType`, specifying the type of a semaphore, are:

```
typedef enum VkSemaphoreTypeKHR {
    VK_SEMAPHORE_TYPE_BINARY_KHR = 0,
    VK_SEMAPHORE_TYPE_TIMELINE_KHR = 1,
    VK_SEMAPHORE_TYPE_MAX_ENUM_KHR = 0x7FFFFFFF
} VkSemaphoreTypeKHR;
```

- `VK_SEMAPHORE_TYPE_BINARY_KHR` specifies a *binary semaphore* type that has a boolean payload indicating whether the semaphore is currently signaled or unsignaled. When created, the semaphore is in the unsignaled state.
- `VK_SEMAPHORE_TYPE_TIMELINE_KHR` specifies a *timeline semaphore* type that has a monotonically increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. When created, the semaphore payload has the value given by the `initialValue` field of `VkSemaphoreTypeCreateInfoKHR`.

To create a semaphore whose payload **can** be exported to external handles, add the `VkExportSemaphoreCreateInfo` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkExportSemaphoreCreateInfo` structure is defined as:

```
typedef struct VkExportSemaphoreCreateInfo {
    VkStructureType          sType;
    const void*               pNext;
    VkExternalSemaphoreHandleTypeFlags handleTypes;
} VkExportSemaphoreCreateInfo;
```

or the equivalent

```
typedef VkExportSemaphoreCreateInfo VkExportSemaphoreCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `handleTypes` is a bitmask of `VkExternalSemaphoreHandleTypeFlagBits` specifying one or more semaphore handle types the application **can** export from the resulting semaphore. The application **can** request multiple handle types for the same semaphore.

## Valid Usage

- The bits in `handleTypes` **must** be supported and compatible, as reported by `VkExternalSemaphoreProperties`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_CREATE_INFO`
- `handleTypes` **must** be a valid combination of `VkExternalSemaphoreHandleTypeFlagBits` values

To specify additional attributes of NT handles exported from a semaphore, add the `VkExportSemaphoreWin32HandleInfoKHR` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkExportSemaphoreWin32HandleInfoKHR` structure is defined as:

```
typedef struct VkExportSemaphoreWin32HandleInfoKHR {
    VkStructureType          sType;
    const void*               pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD                    dwAccess;
    LPCWSTR                  name;
} VkExportSemaphoreWin32HandleInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- `dwAccess` is a `DWORD` specifying access rights of the handle.
- `name` is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created semaphore.

If this structure is not present, or if `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”<sup>1</sup>.

For handles of the following types:

`VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT`

The implementation **must** ensure the access rights allow both signal and wait operations on the semaphore.

For handles of the following types:

`VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`

The access rights **must** be:

**GENERIC\_ALL**

**1**

<https://docs.microsoft.com/en-us/windows/win32/sync/synchronization-object-security-and-access-rights>

## Valid Usage

- If `VkExportSemaphoreCreateInfo::handleTypes` does not include `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`, `VkExportSemaphoreWin32HandleInfoKHR` **must** not be in the `pNext` chain of `VkSemaphoreCreateInfo`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR`
- If `pAttributes` is not `NULL`, `pAttributes` **must** be a valid pointer to a valid `SECURITY_ATTRIBUTES` value

To export a Windows handle representing the payload of a semaphore, call:

```
VkResult vkGetSemaphoreWin32HandleKHR(  
    VkDevice device,  
    const VkSemaphoreGetWin32HandleInfoKHR* pGetWin32HandleInfo,  
    HANDLE* pHandle);
```

- `device` is the logical device that created the semaphore being exported.
- `pGetWin32HandleInfo` is a pointer to a `VkSemaphoreGetWin32HandleInfoKHR` structure containing parameters of the export operation.
- `pHandle` will return the Windows handle representing the semaphore state.

For handle types defined as NT handles, the handles returned by `vkGetSemaphoreWin32HandleKHR` are owned by the application. To avoid leaking resources, the application **must** release ownership of them using the `CloseHandle` system call when they are no longer needed.

Exporting a Windows handle from a semaphore **may** have side effects depending on the transference of the specified handle type, as described in [Importing Semaphore Payloads](#).

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pGetWin32HandleInfo` **must** be a valid pointer to a valid `VkSemaphoreGetWin32HandleInfoKHR` structure
- `pHandle` **must** be a valid pointer to a `HANDLE` value

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkSemaphoreGetWin32HandleInfoKHR` structure is defined as:

```
typedef struct VkSemaphoreGetWin32HandleInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkSemaphore               semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetWin32HandleInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.

## Valid Usage

- `handleType` **must** have been included in `VkExportSemaphoreCreateInfo::handleTypes` when the `semaphore`'s current payload was created.
- If `handleType` is defined as an NT handle, `vkGetSemaphoreWin32HandleKHR` **must** be called no more than once for each valid unique combination of `semaphore` and `handleType`.
- `semaphore` **must** not currently have its payload replaced by an imported payload as described below in [Importing Semaphore Payloads](#) unless that imported payload's handle type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for `handleType`.
- If `handleType` refers to a handle type with copy payload transference semantics, as defined below in [Importing Semaphore Payloads](#), there **must** be no queue waiting on `semaphore`.
- If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` **must** be signaled, or have an associated `semaphore signal operation` pending execution.
- `handleType` **must** be defined as an NT handle or a global share handle.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_WIN32_HANDLE_INFO_KHR`
- `pNext` **must** be `NULL`
- `semaphore` **must** be a valid `VkSemaphore` handle
- `handleType` **must** be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

To export a POSIX file descriptor representing the payload of a semaphore, call:

```
VkResult vkGetSemaphoreFdKHR(  
    VkDevice device,  
    const VkSemaphoreGetFdInfoKHR* pGetFdInfo,  
    int* pFd);
```

- `device` is the logical device that created the semaphore being exported.
- `pGetFdInfo` is a pointer to a `VkSemaphoreGetFdInfoKHR` structure containing parameters of the export operation.
- `pFd` will return the file descriptor representing the semaphore payload.

Each call to `vkGetSemaphoreFdKHR` **must** create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application **must** release ownership of the file descriptor when it is no longer needed.

### Note

Ownership can be released in many ways. For example, the application can call `close()` on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.

Where supported by the operating system, the implementation **must** set the file descriptor to be closed automatically when an `execve` system call is made.

Exporting a file descriptor from a semaphore **may** have side effects depending on the transference of the specified handle type, as described in [Importing Semaphore State](#).

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pGetFdInfo` **must** be a valid pointer to a valid `VkSemaphoreGetFdInfoKHR` structure
- `pFd` **must** be a valid pointer to an `int` value

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkSemaphoreGetFdInfoKHR` structure is defined as:

```
typedef struct VkSemaphoreGetFdInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkSemaphore               semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetFdInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is the type of handle requested.

The properties of the file descriptor returned depend on the value of `handleType`. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.

## Valid Usage

- `handleType` **must** have been included in `VkExportSemaphoreCreateInfo::handleTypes` when `semaphore`'s current payload was created.
- `semaphore` **must** not currently have its payload replaced by an imported payload as described below in [Importing Semaphore Payloads](#) unless that imported payload's handle type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for `handleType`.
- If `handleType` refers to a handle type with copy payload transference semantics, as defined below in [Importing Semaphore Payloads](#), there **must** be no queue waiting on `semaphore`.
- If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` **must** be signaled, or have an associated `semaphore signal operation` pending execution.
- `handleType` **must** be defined as a POSIX file descriptor handle.
- If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` **must** have been created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_BINARY_KHR`.
- If `handleType` refers to a handle type with copy payload transference semantics, `semaphore` **must** have an associated semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) **must** have also been submitted for execution.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_FD_INFO_KHR`
- `pNext` **must** be `NULL`
- `semaphore` **must** be a valid `VkSemaphore` handle
- `handleType` **must** be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

To destroy a semaphore, call:

```
void vkDestroySemaphore(  
    VkDevice device,  
    VkSemaphore semaphore,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the semaphore.
- `semaphore` is the handle of the semaphore to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- All submitted batches that refer to `semaphore` **must** have completed execution
- If `VkAllocationCallbacks` were provided when `semaphore` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `semaphore` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `semaphore` is not `VK_NULL_HANDLE`, `semaphore` **must** be a valid `VkSemaphore` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `semaphore` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `semaphore` **must** be externally synchronized

### 6.4.1. Semaphore Signaling

When a batch is submitted to a queue via a `queue submission`, and it includes semaphores to be signaled, it defines a memory dependency on the batch, and defines *semaphore signal operations* which set the semaphores to the signaled state.

In case of semaphores created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_TIMELINE_KHR` the semaphore is considered signaled with respect to the counter value set to be signaled as specified in `VkTimelineSemaphoreSubmitInfoKHR` or `VkSemaphoreSignalInfoKHR`.

The first `synchronization scope` includes every command submitted in the same batch. Semaphore signal operations that are defined by `vkQueueSubmit` additionally include all commands that occur earlier in `submission order`. Semaphore signal operations that are defined by `vkQueueSubmit` or `vkQueueBindSparse` additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in `signal operation order`.

The second `synchronization scope` includes only the semaphore signal operation.

The first `access scope` includes all memory access performed by the device.

The second `access scope` is empty.

## 6.4.2. Semaphore Waiting

When a batch is submitted to a queue via a [queue submission](#), and it includes semaphores to be waited on, it defines a memory dependency between prior semaphore signal operations and the batch, and defines *semaphore wait operations*.

Such semaphore wait operations set the semaphores created with a [VkSemaphoreTypeKHR](#) of [VK\\_SEMAPHORE\\_TYPE\\_BINARY\\_KHR](#) to the unsignaled state. In case of semaphores created with a [VkSemaphoreTypeKHR](#) of [VK\\_SEMAPHORE\\_TYPE\\_TIMELINE\\_KHR](#) a prior semaphore signal operation defines a memory dependency with a semaphore wait operation if the value the semaphore is signaled with is greater than or equal to the value the semaphore is waited with, thus the semaphore will continue to be considered signaled with respect to the counter value waited on as specified in [VkTimelineSemaphoreSubmitInfoKHR](#).

The first synchronization scope includes all semaphore signal operations that operate on semaphores waited on in the same batch, and that happen-before the wait completes.

The second [synchronization scope](#) includes every command submitted in the same batch. In the case of [vkQueueSubmit](#), the second synchronization scope is limited to operations on the pipeline stages determined by the [destination stage mask](#) specified by the corresponding element of [pWaitDstStageMask](#). Also, in the case of [vkQueueSubmit](#), the second synchronization scope additionally includes all commands that occur later in [submission order](#).

The first [access scope](#) is empty.

The second [access scope](#) includes all memory access performed by the device.

The semaphore wait operation happens-after the first set of operations in the execution dependency, and happens-before the second set of operations in the execution dependency.

*Note*

Unlike timeline semaphores, fences or events, the act of waiting for a binary semaphore also unsignals that semaphore. Applications **must** ensure that between two such wait operations, the semaphore is signaled again, with execution dependencies used to ensure these occur in order. Binary semaphore waits and signals should thus occur in discrete 1:1 pairs.

#### Note

A common scenario for using `pWaitDstStageMask` with values other than `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` is when synchronizing a window system presentation operation against subsequent command buffers which render the next frame. In this case, a presentation image **must** not be overwritten until the presentation operation completes, but other pipeline stages **can** execute without waiting. A mask of `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` prevents subsequent color attachment writes from executing until the semaphore signals. Some implementations **may** be able to execute transfer operations and/or vertex processing work before the semaphore is signaled.

If an image layout transition needs to be performed on a presentable image before it is used in a framebuffer, that **can** be performed as the first operation submitted to the queue after acquiring the image, and **should** not prevent other work from overlapping with the presentation operation. For example, a `VkImageMemoryBarrier` could use:

- `srcStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `srcAccessMask = 0`
- `dstStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `dstAccessMask = VK_ACCESS_COLOR_ATTACHMENT_READ_BIT | VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT.`
- `oldLayout = VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`
- `newLayout = VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

Alternatively, `oldLayout` **can** be `VK_IMAGE_LAYOUT_UNDEFINED`, if the image's contents need not be preserved.

This barrier accomplishes a dependency chain between previous presentation operations and subsequent color attachment output operations, with the layout transition performed in between, and does not introduce a dependency between previous work and any vertex processing stages. More precisely, the semaphore signals after the presentation operation completes, the semaphore wait stalls the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` stage, and there is a dependency from that same stage to itself with the layout transition performed in between.

### 6.4.3. Semaphore State Requirements For Wait Operations

Before waiting on a semaphore, the application **must** ensure the semaphore is in a valid state for a wait operation. Specifically, when a `semaphore wait operation` is submitted to a queue:

- A binary semaphore **must** be signaled, or have an associated `semaphore signal operation` that is pending execution.
- Any `semaphore signal operations` on which the pending binary semaphore signal operation depends **must** also be completed or pending execution.
- There **must** be no other queue waiting on the same binary semaphore when the operation

executes.

#### 6.4.4. Host Operations on Semaphores

In addition to [semaphore signal operations](#) and [semaphore wait operations](#) submitted to device queues, timeline semaphores support the following host operations:

- Query the current counter value of the semaphore using the [vkGetSemaphoreCounterValueKHR](#) command.
- Wait for a set of semaphores to reach particular counter values using the [vkWaitSemaphoresKHR](#) command.
- Signal the semaphore with a particular counter value from the host using the [vkSignalSemaphoreKHR](#) command.

To query the current counter value of a semaphore created with a [VkSemaphoreTypeKHR](#) of [VK\\_SEMAPHORE\\_TYPE\\_TIMELINE\\_KHR](#) from the host, call:

```
VkResult vkGetSemaphoreCounterValueKHR(  
    VkDevice device,  
    VkSemaphore semaphore,  
    uint64_t* pValue);
```

- **device** is the logical device that owns the semaphore.
- **semaphore** is the handle of the semaphore to query.
- **pValue** is a pointer to a 64-bit integer value in which the current counter value of the semaphore is returned.

*Note*

If a [queue submission](#) command is pending execution, then the value returned by this command **may** immediately be out of date.

#### Valid Usage

- **semaphore must** have been created with a [VkSemaphoreTypeKHR](#) of [VK\\_SEMAPHORE\\_TYPE\\_TIMELINE\\_KHR](#)

#### Valid Usage (Implicit)

- **device must** be a valid [VkDevice](#) handle
- **semaphore must** be a valid [VkSemaphore](#) handle
- **pValue must** be a valid pointer to a [uint64\\_t](#) value
- **semaphore must** have been created, allocated, or retrieved from **device**

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

To wait for a set of semaphores created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_TIMELINE_KHR` to reach particular counter values on the host, call:

```
VkResult vkWaitSemaphoresKHR(  
    VkDevice device,  
    const VkSemaphoreWaitInfoKHR* pWaitInfo,  
    uint64_t timeout);
```

- `device` is the logical device that owns the semaphore.
- `pWaitInfo` is a pointer to an instance of the `VkSemaphoreWaitInfoKHR` structure containing information about the wait condition.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

If the condition is satisfied when `vkWaitSemaphoresKHR` is called, then `vkWaitSemaphoresKHR` returns immediately. If the condition is not satisfied at the time `vkWaitSemaphoresKHR` is called, then `vkWaitSemaphoresKHR` will block and wait up to `timeout` nanoseconds for the condition to become satisfied.

If `timeout` is zero, then `vkWaitSemaphoresKHR` does not wait, but simply returns information about the current state of the semaphore. `VK_TIMEOUT` will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the specified timeout period expires before the condition is satisfied, `vkWaitSemaphoresKHR` returns `VK_TIMEOUT`. If the condition is satisfied before `timeout` nanoseconds has expired, `vkWaitSemaphoresKHR` returns `VK_SUCCESS`.

If device loss occurs (see [Lost Device](#)) before the timeout has expired, `vkWaitSemaphoresKHR` **must** return in finite time with either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pWaitInfo` **must** be a valid pointer to a valid `VkSemaphoreWaitInfoKHR` structure

## Return Codes

### Success

- `VK_SUCCESS`
- `VK_TIMEOUT`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

The `VkSemaphoreWaitInfoKHR` structure is defined as:

```
typedef struct VkSemaphoreWaitInfoKHR {
    VkStructureType          sType;
    const void*               pNext;
    VkSemaphoreWaitFlagsKHR   flags;
    uint32_t                  semaphoreCount;
    const VkSemaphore*        pSemaphores;
    const uint64_t*           pValues;
} VkSemaphoreWaitInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is a bitmask of `VkSemaphoreWaitFlagBitsKHR` specifying additional parameters for the semaphore wait operation.
- `semaphoreCount` is the number of semaphores to wait on.
- `pSemaphores` is a pointer to an array of `semaphoreCount` semaphore handles to wait on.
- `pValues` is a pointer to an array of `semaphoreCount` timeline semaphore values.

## Valid Usage

- All of the elements of `pSemaphores` **must** reference a semaphore that was created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_TIMELINE_KHR`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_WAIT_INFO_KHR`
- `pNext` **must** be `NULL`
- `flags` **must** be a valid combination of `VkSemaphoreWaitFlagBitsKHR` values
- `pSemaphores` **must** be a valid pointer to an array of `semaphoreCount` valid `VkSemaphore` handles
- `pValues` **must** be a valid pointer to an array of `semaphoreCount uint64_t` values
- `semaphoreCount` **must** be greater than `0`

Bits which **can** be set in `VkSemaphoreWaitInfoKHR::flags`, specifying additional parameters of a semaphore wait operation, are:

```
typedef enum VkSemaphoreWaitFlagBitsKHR {
    VK_SEMAPHORE_WAIT_ANY_BIT_KHR = 0x00000001,
    VK_SEMAPHORE_WAIT_FLAG_BITS_MAX_ENUM_KHR = 0x7FFFFFFF
} VkSemaphoreWaitFlagBitsKHR;
```

- `VK_SEMAPHORE_WAIT_ANY_BIT_KHR` specifies that the semaphore wait condition is that at least one of the semaphores in `VkSemaphoreWaitInfoKHR::pSemaphores` has reached the value specified by the corresponding element of `VkSemaphoreWaitInfoKHR::pValues`. If `VK_SEMAPHORE_WAIT_ANY_BIT_KHR` is not set, the semaphore wait condition is that all of the semaphores in `VkSemaphoreWaitInfoKHR ::pSemaphores` have reached the value specified by the corresponding element of `VkSemaphoreWaitInfoKHR::pValues`.

```
typedef VkFlags VkSemaphoreWaitFlagsKHR;
```

`VkSemaphoreWaitFlagsKHR` is a bitmask type for setting a mask of zero or more `VkSemaphoreWaitFlagBitsKHR`.

To signal a semaphore created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_TIMELINE_KHR` with a particular counter value, on the host, call:

```
VkResult vkSignalSemaphoreKHR(
    VkDevice                                     device,
    const VkSemaphoreSignalInfoKHR* pSignalInfo);
```

- `device` is the logical device that owns the semaphore.
- `pSignalInfo` is a pointer to an instance of the `VkSemaphoreSignalInfoKHR` structure containing information about the signal operation.

When `vkSignalSemaphoreKHR` is executed on the host, it defines and immediately executes a

[semaphore signal operation](#) which sets the timeline semaphore to the given value.

The first synchronization scope is defined by the host execution model, but includes execution of `vkSignalSemaphoreKHR` on the host and anything that happened-before it.

The second synchronization scope is empty.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pSignalInfo` **must** be a valid pointer to a valid `VkSemaphoreCreateInfoKHR` structure

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkSemaphoreCreateInfoKHR` structure is defined as:

```
typedef struct VkSemaphoreCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSemaphore        semaphore;
    uint64_t           value;
} VkSemaphoreCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `semaphore` is the handle of the semaphore to signal.
- `value` is the value to signal.

## Valid Usage

- `semaphore` **must** have been created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_TIMELINE_KHR`
- `value` **must** have a value greater than the current value of the semaphore
- `value` **must** be less than the value of any pending semaphore signal operations
- `value` **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on `semaphore` by more than `maxTimelineSemaphoreValueDifference`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_SIGNAL_INFO_KHR`
- `pNext` **must** be `NULL`
- `semaphore` **must** be a valid `VkSemaphore` handle

### 6.4.5. Importing Semaphore Payloads

Applications **can** import a semaphore payload into an existing semaphore using an external semaphore handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the implementation **must** restore the semaphore to its prior permanent state after submitting the next semaphore wait operation. Performing a subsequent temporary import on a semaphore before performing a semaphore wait has no effect on this requirement; the next wait submitted on the semaphore **must** still restore its last permanent state. A permanent payload import behaves as if the target semaphore was destroyed, and a new semaphore was created with the same handle but the imported payload. Because importing a semaphore payload temporarily or permanently detaches the existing payload from a semaphore, similar usage restrictions to those applied to `vkDestroySemaphore` are applied to any command that imports a semaphore payload. Which of these import types is used is referred to as the import operation's *permanence*. Each handle type supports either one or both types of permanence.

The implementation **must** perform the import operation by either referencing or copying the payload referred to by the specified external semaphore handle, depending on the handle's type. The import method used is referred to as the handle type's *transference*. When using handle types with reference transference, importing a payload to a semaphore adds the semaphore to the set of all semaphores sharing that payload. This set includes the semaphore from which the payload was exported. Semaphore signaling and waiting operations performed on any semaphore in the set **must** behave as if the set were a single semaphore. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Semaphore signaling and waiting operations performed on the target of copy imports **must** not affect any other semaphore or payload.

Export operations have the same transference as the specified handle type's import operations.

Additionally, exporting a semaphore payload to a handle with copy transference has the same side effects on the source semaphore's payload as executing a semaphore wait operation. If the semaphore was using a temporarily imported payload, the semaphore's prior permanent payload will be restored.

*Note*

The tables [Handle Types Supported by VkImportSemaphoreWin32HandleInfoKHR](#) and [Handle Types Supported by VkImportSemaphoreFdInfoKHR](#) define the permanence and transference of each handle type.

[External synchronization](#) allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for semaphores sharing a payload across processes, satisfying the external synchronization requirements of [VkSemaphore](#) parameters as if all semaphores in the set were the same object is sometimes infeasible. Satisfying the [wait operation state requirements](#) would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific semaphore handle, not to its payload. For distinct semaphore objects which share a payload, if the semaphores are passed to separate queue submission commands concurrently, behavior will be as if the commands were called in an arbitrary sequential order. If the [wait operation state requirements](#) are violated for the shared payload by a queue submission command, or if a signal operation is queued for a shared payload that is already signaled or has a pending signal operation, effects **must** be limited to one or more of the following:

- Returning [VK\\_ERROR\\_INITIALIZATION\\_FAILED](#) from the command which resulted in the violation.
- Losing the logical device on which the violation occurred immediately or at a future time, resulting in a [VK\\_ERROR\\_DEVICE\\_LOST](#) error from subsequent commands, including the one causing the violation.
- Continuing execution of the violating command or operation as if the semaphore wait completed successfully after an implementation-dependent timeout. In this case, the state of the payload becomes undefined, and future operations on semaphores sharing the payload will be subject to these same rules. The semaphore **must** be destroyed or have its payload replaced by an import operation to again have a well-defined state.

*Note*

These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared semaphore for more than synchronizing access to the shared memory. For example, a process should not use a shared semaphore as part of an execution dependency chain that, when complete, leads to objects being destroyed, if it does not trust other processes sharing the semaphore payload.

When a semaphore is using an imported payload, its [VkExportSemaphoreCreateInfo::handleTypes](#) value is that specified when creating the semaphore from which the payload was exported, rather than that specified when creating the semaphore. Additionally, [VkExternalSemaphoreProperties::exportFromImportedHandleTypes](#) restricts which handle types **can** be exported from such a semaphore based on the specific handle type used to import the current payload. Passing a semaphore to [vkAcquireNextImageKHR](#) is equivalent to temporarily importing a semaphore

payload to that semaphore.

*Note*

Because the exportable handle types of an imported semaphore correspond to its current imported payload, and [vkAcquireNextImageKHR](#) behaves the same as a temporary import operation for which the source semaphore is opaque to the application, applications have no way of determining whether any external handle types **can** be exported from a semaphore in this state. Therefore, applications **must** not attempt to export external handles from semaphores using a temporarily imported payload from [vkAcquireNextImageKHR](#).

When importing a semaphore payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations **must** perform sufficient validation of external handles to ensure that the operation results in a valid semaphore which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its import parameters, and excepting those side effects allowed for violations of the [valid semaphore state for wait operations](#) rules. If the external handle provided does not meet these requirements, the implementation **must** fail the semaphore payload import operation with the error code [VK\\_ERROR\\_INVALID\\_EXTERNAL\\_HANDLE](#).

In addition, when importing a semaphore payload that is not compatible with the payload type corresponding to the [VkSemaphoreTypeKHR](#) the semaphore was created with, the implementation **may** fail the semaphore payload import operation with the error code [VK\\_ERROR\\_INVALID\\_EXTERNAL\\_HANDLE](#).

*Note*

As the introduction of the external semaphore handle type [VK\\_EXTERNAL\\_SEMAPHORE\\_HANDLE\\_TYPE\\_D3D12\\_FENCE\\_BIT](#) predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a [VkSemaphoreTypeKHR](#) of [VK\\_SEMAPHORE\\_TYPE\\_BINARY\\_KHR](#) is preserved for backwards compatibility. However, applications **should** prefer importing such handle types into semaphores created with a [VkSemaphoreTypeKHR](#) of [VK\\_SEMAPHORE\\_TYPE\\_TIMELINE\\_KHR](#).

To import a semaphore payload from a Windows handle, call:

```
VkResult vkImportSemaphoreWin32HandleKHR(  
    VkDevice                               device,  
    const VkImportSemaphoreWin32HandleInfoKHR* pImportSemaphoreWin32HandleInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreWin32HandleInfo` is a pointer to a [VkImportSemaphoreWin32HandleInfoKHR](#) structure specifying the semaphore and import parameters.

Importing a semaphore payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application **must**

release ownership using the `CloseHandle` system call when the handle is no longer needed.

Applications **can** import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pImportSemaphoreWin32HandleInfo` **must** be a valid pointer to a valid `VkImportSemaphoreWin32HandleInfoKHR` structure

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportSemaphoreWin32HandleInfoKHR` structure is defined as:

```
typedef struct VkImportSemaphoreWin32HandleInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkSemaphore                semaphore;
    VkSemaphoreImportFlags      flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    HANDLE                     handle;
    LPCWSTR                   name;
} VkImportSemaphoreWin32HandleInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `semaphore` is the semaphore into which the payload will be imported.
- `flags` is a bitmask of `VkSemaphoreImportFlagBits` specifying additional parameters for the semaphore payload import operation.
- `handleType` specifies the type of `handle`.
- `handle` is the external handle to import, or `NULL`.
- `name` is a null-terminated UTF-16 string naming the underlying synchronization primitive to import, or `NULL`.

The handle types supported by `handleType` are:

Table 8. Handle Types Supported by [VkImportSemaphoreWin32HandleInfoKHR](#)

Handle Type	Transference	Permanence Supported
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT</code>	Reference	Temporary,Permanent
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT</code>	Reference	Temporary,Permanent
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT</code>	Reference	Temporary,Permanent

## Valid Usage

- `handleType` **must** be a value included in the Handle Types Supported by [VkImportSemaphoreWin32HandleInfoKHR](#) table.
- If `handleType` is not `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`, `name` **must** be `NULL`.
- If `handleType` is not `0` and `name` is `NULL`, `name` **must** name a valid synchronization primitive of the type specified by `handleType`.
- If `handleType` is not `0` and `name` is `NULL`, `handle` **must** be a valid handle of the type specified by `handleType`.
- If `handle` is not `NULL`, `name` **must** be `NULL`.
- If `handle` is not `NULL`, it **must** obey any requirements listed for `handleType` in [external semaphore handle types compatibility](#).
- If `name` is not `NULL`, it **must** obey any requirements listed for `handleType` in [external semaphore handle types compatibility](#).
- If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, the `VkSemaphoreCreateInfo`::`flags` field **must** match that of the semaphore from which `handle` or `name` was exported.
- If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, the `VkSemaphoreTypeCreateInfoKHR`::`semaphoreType` field **must** match that of the semaphore from which `handle` or `name` was exported.
- If `flags` contains `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`, the `VkSemaphoreTypeCreateInfoKHR`::`semaphoreType` field of the semaphore from which `handle` or `name` was exported **must** not be `VK_SEMAPHORE_TYPE_TIMELINE_KHR`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR`
- `pNext` **must** be `NULL`
- `semaphore` **must** be a valid `VkSemaphore` handle
- `flags` **must** be a valid combination of `VkSemaphoreImportFlagBits` values
- If `handleType` is not `0`, `handleType` **must** be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

## Host Synchronization

- Host access to `semaphore` **must** be externally synchronized

To import a semaphore payload from a POSIX file descriptor, call:

```
VkResult vkImportSemaphoreFdKHR(  
    VkDevice device,  
    const VkImportSemaphoreFdInfoKHR* pImportSemaphoreFdInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreFdInfo` is a pointer to a `VkImportSemaphoreFdInfoKHR` structure specifying the semaphore and import parameters.

Importing a semaphore payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import.

Applications **can** import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

## Valid Usage

- `semaphore` **must** not be associated with any queue command that has not yet completed execution on that queue

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pImportSemaphoreFdInfo` **must** be a valid pointer to a valid `VkImportSemaphoreFdInfoKHR` structure

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportSemaphoreFdInfoKHR` structure is defined as:

```
typedef struct VkImportSemaphoreFdInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkSemaphore               semaphore;
    VkSemaphoreImportFlags    flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    int                       fd;
} VkImportSemaphoreFdInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `semaphore` is the semaphore into which the payload will be imported.
- `flags` is a bitmask of `VkSemaphoreImportFlagBits` specifying additional parameters for the semaphore payload import operation.
- `handleType` specifies the type of `fd`.
- `fd` is the external handle to import.

The handle types supported by `handleType` are:

Table 9. Handle Types Supported by `VkImportSemaphoreFdInfoKHR`

Handle Type	Transference	Permanence Supported
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT</code>	Reference	Temporary,Permanent
<code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT</code>	Copy	Temporary

## Valid Usage

- `handleType` **must** be a value included in the Handle Types Supported by [VkImportSemaphoreFdInfoKHR](#) table.
- `fd` **must** obey any requirements listed for `handleType` in [external semaphore handle types compatibility](#).
- If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the [VkSemaphoreCreateInfo::flags](#) field **must** match that of the semaphore from which `fd` was exported.
- If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the [VkSemaphoreTypeCreateInfoKHR::semaphoreType](#) field **must** match that of the semaphore from which `fd` was exported.
- If `flags` contains `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`, the [VkSemaphoreTypeCreateInfoKHR::semaphoreType](#) field of the semaphore from which `fd` was exported **must** not be `VK_SEMAPHORE_TYPE_TIMELINE_KHR`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_FD_INFO_KHR`
- `pNext` **must** be `NULL`
- `semaphore` **must** be a valid `VkSemaphore` handle
- `flags` **must** be a valid combination of `VkSemaphoreImportFlagBits` values
- `handleType` **must** be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

## Host Synchronization

- Host access to `semaphore` **must** be externally synchronized

Additional parameters of a semaphore import operation are specified by [VkImportSemaphoreWin32HandleInfoKHR::flags](#) or [VkImportSemaphoreFdInfoKHR::flags](#). Bits which can be set include:

```
typedef enum VkSemaphoreImportFlagBits {
    VK_SEMAPHORE_IMPORT_TEMPORARY_BIT = 0x00000001,
    VK_SEMAPHORE_IMPORT_TEMPORARY_BIT_KHR = VK_SEMAPHORE_IMPORT_TEMPORARY_BIT,
    VK_SEMAPHORE_IMPORT_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkSemaphoreImportFlagBits;
```

or the equivalent

```
typedef VkSemaphoreImportFlagBits VkSemaphoreImportFlagBitsKHR;
```

These bits have the following meanings:

- **VK\_SEMAPHORE\_IMPORT\_TEMPORARY\_BIT** specifies that the semaphore payload will be imported only temporarily, as described in [Importing Semaphore Payloads](#), regardless of the permanence of **handleType**.

```
typedef VkFlags VkSemaphoreImportFlags;
```

or the equivalent

```
typedef VkSemaphoreImportFlags VkSemaphoreImportFlagsKHR;
```

**VkSemaphoreImportFlags** is a bitmask type for setting a mask of zero or more [VkSemaphoreImportFlagBits](#).

## 6.5. Events

Events are a synchronization primitive that **can** be used to insert a fine-grained dependency between commands submitted to the same queue, or between the host and a queue. Events **must** not be used to insert a dependency between commands submitted to different queues. Events have two states - signaled and unsignaled. An application **can** signal an event, or unsignal it, on either the host or the device. A device **can** wait for an event to become signaled before executing further operations. No command exists to wait for an event to become signaled on the host, but the current state of an event **can** be queried.

Events are represented by **VkEvent** handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkEvent)
```

To create an event, call:

```
VkResult vkCreateEvent(  
    VkDevice                                     device,  
    const VkEventCreateInfo*                    pCreateInfo,  
    const VkAllocationCallbacks*                pAllocator,  
    VkEvent*                                    pEvent);
```

- **device** is the logical device that creates the event.
- **pCreateInfo** is a pointer to a **VkEventCreateInfo** structure containing information about how the event is to be created.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

- `pEvent` is a pointer to a handle in which the resulting event object is returned.

When created, the event object is in the unsignaled state.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkEventCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pEvent` **must** be a valid pointer to a `VkEvent` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkEventCreateInfo` structure is defined as:

```
typedef struct VkEventCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkEventCreateFlags flags;
} VkEventCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is reserved for future use.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_EVENT_CREATE_INFO`
- `pNext` **must** be `NULL`
- `flags` **must** be `0`

```
typedef VkFlags VkEventCreateFlags;
```

`VkEventCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy an event, call:

```
void vkDestroyEvent(  
    VkDevice device,  
    VkEvent event,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the event.
- `event` is the handle of the event to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- All submitted commands that refer to `event` **must** have completed execution
- If `VkAllocationCallbacks` were provided when `event` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `event` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `event` is not `VK_NULL_HANDLE`, `event` **must** be a valid `VkEvent` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `event` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `event` **must** be externally synchronized

To query the state of an event from the host, call:

```
VkResult vkGetEventStatus(  
    VkDevice device,  
    VkEvent event);
```

- `device` is the logical device that owns the event.
- `event` is the handle of the event to query.

Upon success, `vkGetEventStatus` returns the state of the event object with the following return codes:

Table 10. Event Object Status Codes

Status	Meaning
<code>VK_EVENT_SET</code>	The event specified by <code>event</code> is signaled.
<code>VK_EVENT_RESET</code>	The event specified by <code>event</code> is unsignaled.

If a `vkCmdSetEvent` or `vkCmdResetEvent` command is in a command buffer that is in the `pending` state, then the value returned by this command **may** immediately be out of date.

The state of an event **can** be updated by the host. The state of the event is immediately changed, and subsequent calls to `vkGetEventStatus` will return the new state. If an event is already in the requested state, then updating it to the same state has no effect.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `event` **must** be a valid `VkEvent` handle
- `event` **must** have been created, allocated, or retrieved from `device`

## Return Codes

### Success

- `VK_EVENT_SET`
- `VK_EVENT_RESET`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

To set the state of an event to signaled from the host, call:

```
VkResult vkSetEvent(  
    VkDevice           device,  
    VkEvent            event);
```

- `device` is the logical device that owns the event.
- `event` is the event to set.

When `vkSetEvent` is executed on the host, it defines an *event signal operation* which sets the event to the signaled state.

If `event` is already in the signaled state when `vkSetEvent` is executed, then `vkSetEvent` has no effect, and no event signal operation occurs.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `event` **must** be a valid `VkEvent` handle
- `event` **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `event` **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To set the state of an event to unsignaled from the host, call:

```
VkResult vkResetEvent(  
    VkDevice                device,  
    VkEvent                 event);
```

- `device` is the logical device that owns the event.
- `event` is the event to reset.

When `vkResetEvent` is executed on the host, it defines an *event unsignal operation* which resets the event to the unsignaled state.

If `event` is already in the unsignaled state when `vkResetEvent` is executed, then `vkResetEvent` has no effect, and no event unsignal operation occurs.

## Valid Usage

- `event` **must** not be waited on by a `vkCmdWaitEvents` command that is currently executing

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `event` **must** be a valid `VkEvent` handle
- `event` **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `event` **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The state of an event **can** also be updated on the device by commands inserted in command buffers.

To set the state of an event to signaled from a device, call:

```
void vkCmdSetEvent(  
    VkCommandBuffer  
    VkEvent  
    VkPipelineStageFlags  
        commandBuffer,  
        event,  
        stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be signaled.
- `stageMask` specifies the `source stage mask` used to determine when the `event` is signaled.

When `vkCmdSetEvent` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and defines an event signal operation which sets the event to the signaled state.

The first `synchronization scope` includes all commands that occur earlier in `submission order`. The synchronization scope is limited to operations on the pipeline stages determined by the `source stage mask` specified by `stageMask`.

The second `synchronization scope` includes only the event signal operation.

If `event` is already in the signaled state when `vkCmdSetEvent` is executed on the device, then

`vkCmdSetEvent` has no effect, no event signal operation occurs, and no execution dependency is generated.

## Valid Usage

- `stageMask` **must** not include `VK_PIPELINE_STAGE_HOST_BIT`
- If the `geometry shaders` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- If the `tessellation shaders` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- `commandBuffer`'s current device mask **must** include exactly one physical device.
- If the `mesh shaders` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`
- If the `task shaders` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `event` **must** be a valid `VkEvent` handle
- `stageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- `stageMask` **must** not be `0`
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- This command **must** only be called outside of a render pass instance
- Both of `commandBuffer`, and `event` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Outside	Graphics Compute	

To set the state of an event to unsignaled from a device, call:

```
void vkCmdResetEvent(  
    VkCommandBuffer  
    VkEvent  
    VkPipelineStageFlags  
        commandBuffer,  
        event,  
        stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be unsignaled.
- `stageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the `source stage mask` used to determine when the `event` is unsignaled.

When `vkCmdResetEvent` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and defines an event unsignal operation which resets the event to the unsignaled state.

The first `synchronization scope` includes all commands that occur earlier in `submission order`. The synchronization scope is limited to operations on the pipeline stages determined by the `source stage mask` specified by `stageMask`.

The second `synchronization scope` includes only the event unsignal operation.

If `event` is already in the unsignaled state when `vkCmdResetEvent` is executed on the device, then `vkCmdResetEvent` has no effect, no event unsignal operation occurs, and no execution dependency is generated.

## Valid Usage

- `stageMask` **must** not include `VK_PIPELINE_STAGE_HOST_BIT`
- If the `geometry shaders` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- If the `tessellation shaders` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- When this command executes, `event` **must** not be waited on by a `vkCmdWaitEvents` command that is currently executing
- `commandBuffer`'s current device mask **must** include exactly one physical device.
- If the `mesh shaders` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`
- If the `task shaders` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `event` **must** be a valid `VkEvent` handle
- `stageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- `stageMask` **must** not be `0`
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- This command **must** only be called outside of a render pass instance
- Both of `commandBuffer`, and `event` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Outside	Graphics Compute	

To wait for one or more events to enter the signaled state on a device, call:

```
void vkCmdWaitEvents(  
    VkCommandBuffer  
    uint32_t  
    const VkEvent*  
    VkPipelineStageFlags  
    VkPipelineStageFlags  
    uint32_t  
    const VkMemoryBarrier*  
    uint32_t  
    const VkBufferMemoryBarrier*  
    uint32_t  
    const VkImageMemoryBarrier*  
        commandBuffer,  
        eventCount,  
        pEvents,  
        srcStageMask,  
        dstStageMask,  
        memoryBarrierCount,  
        pMemoryBarriers,  
        bufferMemoryBarrierCount,  
        pBufferMemoryBarriers,  
        imageMemoryBarrierCount,  
        pImageMemoryBarriers);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `eventCount` is the length of the `pEvents` array.
- `pEvents` is a pointer to an array of event object handles to wait on.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the `source stage mask`.
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the `destination stage mask`.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier` structures.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier` structures.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier` structures.

When `vkCmdWaitEvents` is submitted to a queue, it defines a memory dependency between prior event signal operations on the same queue or the host, and subsequent commands. `vkCmdWaitEvents` **must** not be used to wait on event signal operations occurring on other queues.

The first synchronization scope only includes event signal operations that operate on members of `pEvents`, and the operations that happened-before the event signal operations. Event signal operations performed by `vkCmdSetEvent` that occur earlier in `submission order` are included in the first synchronization scope, if the `logically latest` pipeline stage in their `stageMask` parameter is `logically earlier` than or equal to the `logically latest` pipeline stage in `srcStageMask`. Event signal

operations performed by `vkSetEvent` are only included in the first synchronization scope if `VK_PIPELINE_STAGE_HOST_BIT` is included in `srcStageMask`.

The second synchronization scope includes all commands that occur later in submission order. The second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by `dstStageMask`.

The first access scope is limited to access in the pipeline stages determined by the source stage mask specified by `srcStageMask`. Within that, the first access scope only includes the first access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the first access scope includes no accesses.

The second access scope is limited to access in the pipeline stages determined by the destination stage mask specified by `dstStageMask`. Within that, the second access scope only includes the second access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the second access scope includes no accesses.

*Note*

`vkCmdWaitEvents` is used with `vkCmdSetEvent` to define a memory dependency between two sets of action commands, roughly in the same way as pipeline barriers, but split into two commands such that work between the two may execute unhindered.

Unlike `vkCmdPipelineBarrier`, a queue family ownership transfer cannot be performed using `vkCmdWaitEvents`.

*Note*

Applications should be careful to avoid race conditions when using events. There is no direct ordering guarantee between a `vkCmdResetEvent` command and a `vkCmdWaitEvents` command submitted after it, so some other execution dependency must be included between these commands (e.g. a semaphore).

## Valid Usage

- `srcStageMask` **must** be the bitwise OR of the `stageMask` parameter used in previous calls to `vkCmdSetEvent` with any of the members of `pEvents` and `VK_PIPELINE_STAGE_HOST_BIT` if any of the members of `pEvents` was set using `vkSetEvent`
- If the `geometry shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- If the `geometry shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- If the `tessellation shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- If the `tessellation shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- If `pEvents` includes one or more events that will be signaled by `vkSetEvent` after `commandBuffer` has been submitted to a queue, then `vkCmdWaitEvents` **must** not be called inside a render pass instance
- Any pipeline stage included in `srcStageMask` or `dstStageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#).
- Each element of `pMemoryBarriers`, `pBufferMemoryBarriers` or `pImageMemoryBarriers` **must** not have any access flag included in its `srcAccessMask` member if that bit is not supported by any of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#).
- Each element of `pMemoryBarriers`, `pBufferMemoryBarriers` or `pImageMemoryBarriers` **must** not have any access flag included in its `dstAccessMask` member if that bit is not supported by any of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#).
- The `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any element of `pBufferMemoryBarriers` or `pImageMemoryBarriers` **must** be equal.
- `commandBuffer`'s current device mask **must** include exactly one physical device.
- If the `mesh shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`
- If the `task shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`
- If the `mesh shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`
- If the `task shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`
- The `srcAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)

- The `dstAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)
- The `srcAccessMask` member of each element of `pBufferMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)
- The `dstAccessMask` member of each element of `pBufferMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)
- The `srcAccessMask` member of each element of `pImageMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)
- The `dstAccessMask` member of any element of `pImageMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `pEvents` **must** be a valid pointer to an array of `eventCount` valid `VkEvent` handles
- `srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- `srcStageMask` **must** not be `0`
- `dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- `dstStageMask` **must** not be `0`
- If `memoryBarrierCount` is not `0`, `pMemoryBarriers` **must** be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier` structures
- If `bufferMemoryBarrierCount` is not `0`, `pBufferMemoryBarriers` **must** be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier` structures
- If `imageMemoryBarrierCount` is not `0`, `pImageMemoryBarriers` **must** be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier` structures
- `commandBuffer` **must** be in the [recording state](#)
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- `eventCount` **must** be greater than `0`
- Both of `commandBuffer`, and the elements of `pEvents` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Graphics Compute	

## 6.6. Pipeline Barriers

`vkCmdPipelineBarrier` is a synchronization command that inserts a dependency between commands submitted to the same queue, or between commands in the same subpass.

To record a pipeline barrier, call:

```
void vkCmdPipelineBarrier(  
    VkCommandBuffer  
    VkPipelineStageFlags  
    VkPipelineStageFlags  
    VkDependencyFlags  
    uint32_t  
    const VkMemoryBarrier*  
    uint32_t  
    const VkBufferMemoryBarrier*  
    uint32_t  
    const VkImageMemoryBarrier*  
                                commandBuffer,  
                                srcStageMask,  
                                dstStageMask,  
                                dependencyFlags,  
                                memoryBarrierCount,  
                                pMemoryBarriers,  
                                bufferMemoryBarrierCount,  
                                pBufferMemoryBarriers,  
                                imageMemoryBarrierCount,  
                                pImageMemoryBarriers);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the `source stage mask`.
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the `destination stage mask`.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier` structures.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier` structures.

- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier` structures.

When `vkCmdPipelineBarrier` is submitted to a queue, it defines a memory dependency between commands that were submitted before it, and those submitted after it.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the first synchronization scope includes all commands that occur earlier in `submission order`. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the first synchronization scope includes only commands that occur earlier in `submission order` within the same subpass. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the `source stage mask` specified by `srcStageMask`.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the second synchronization scope includes all commands that occur later in `submission order`. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the second synchronization scope includes only commands that occur later in `submission order` within the same subpass. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`.

The first `access scope` is limited to access in the pipeline stages determined by the `source stage mask` specified by `srcStageMask`. Within that, the first access scope only includes the first access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of `memory barriers`. If no memory barriers are specified, then the first access scope includes no accesses.

The second `access scope` is limited to access in the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`. Within that, the second access scope only includes the second access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of `memory barriers`. If no memory barriers are specified, then the second access scope includes no accesses.

If `dependencyFlags` includes `VK_DEPENDENCY_BY_REGION_BIT`, then any dependency between framebuffer-space pipeline stages is `framebuffer-local` - otherwise it is `framebuffer-global`.

## Valid Usage

- If the `geometry shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- If the `geometry shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- If the `tessellation shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- If the `tessellation shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- If `vkCmdPipelineBarrier` is called within a render pass instance, the render pass **must** have been created with at least one `VkSubpassDependency` instance in `VkRenderPassCreateInfo::pDependencies` that expresses a dependency from the current subpass to itself, and for which `srcStageMask` contains a subset of the bit values in `VkSubpassDependency::srcStageMask`, `dstStageMask` contains a subset of the bit values in `VkSubpassDependency::dstStageMask`, `dependencyFlags` is equal to `VkSubpassDependency::dependencyFlags`, `srcAccessMask` member of each element of `pMemoryBarriers` and `pImageMemoryBarriers` contains a subset of the bit values in `VkSubpassDependency::srcAccessMask`, and `dstAccessMask` member of each element of `pMemoryBarriers` and `pImageMemoryBarriers` contains a subset of the bit values in `VkSubpassDependency::dstAccessMask`
- If `vkCmdPipelineBarrier` is called within a render pass instance, `bufferMemoryBarrierCount` **must** be `0`
- If `vkCmdPipelineBarrier` is called within a render pass instance, the `image` member of any element of `pImageMemoryBarriers` **must** be equal to one of the elements of `pAttachments` that the current `framebuffer` was created with, that is also referred to by one of the elements of the `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment` members of the `VkSubpassDescription` instance or by the `pDepthStencilResolveAttachment` member of the `VkSubpassDescriptionDepthStencilResolveKHR` structure that the current subpass was created with
- If `vkCmdPipelineBarrier` is called within a render pass instance, the `oldLayout` and `newLayout` members of any element of `pImageMemoryBarriers` **must** be equal to the `layout` member of an element of the `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment` members of the `VkSubpassDescription` instance or by the `pDepthStencilResolveAttachment` member of the `VkSubpassDescriptionDepthStencilResolveKHR` structure that the current subpass was created with, that refers to the same `image`
- If `vkCmdPipelineBarrier` is called within a render pass instance, the `oldLayout` and `newLayout` members of an element of `pImageMemoryBarriers` **must** be equal
- If `vkCmdPipelineBarrier` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any element of `pImageMemoryBarriers` **must** be `VK_QUEUE_FAMILY_IGNORED`
- Any pipeline stage included in `srcStageMask` or `dstStageMask` **must** be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the

`VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the [table of supported pipeline stages](#)

- If `vkCmdPipelineBarrier` is called outside of a render pass instance, `dependencyFlags` **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`
- If the `mesh shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`
- If the `task shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`
- If the `mesh shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`
- If the `task shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`
- The `srcAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)
- The `dstAccessMask` member of each element of `pMemoryBarriers` **must** only include access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)
- For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)
- For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)
- For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)
- For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member **must** only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- `srcStageMask` **must** not be `0`
- `dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- `dstStageMask` **must** not be `0`
- `dependencyFlags` **must** be a valid combination of `VkDependencyFlagBits` values
- If `memoryBarrierCount` is not `0`, `pMemoryBarriers` **must** be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier` structures
- If `bufferMemoryBarrierCount` is not `0`, `pBufferMemoryBarriers` **must** be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier` structures
- If `imageMemoryBarrierCount` is not `0`, `pImageMemoryBarriers` **must** be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier` structures
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Transfer Graphics Compute	

Bits which **can** be set in `vkCmdPipelineBarrier::dependencyFlags`, specifying how execution and memory dependencies are formed, are:

```

typedef enum VkDependencyFlagBits {
    VK_DEPENDENCY_BY_REGION_BIT = 0x00000001,
    VK_DEPENDENCY_DEVICE_GROUP_BIT = 0x00000004,
    VK_DEPENDENCY_VIEW_LOCAL_BIT = 0x00000002,
    VK_DEPENDENCY_VIEW_LOCAL_BIT_KHR = VK_DEPENDENCY_VIEW_LOCAL_BIT,
    VK_DEPENDENCY_DEVICE_GROUP_BIT_KHR = VK_DEPENDENCY_DEVICE_GROUP_BIT,
    VK_DEPENDENCY_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkDependencyFlagBits;

```

- **VK\_DEPENDENCY\_BY\_REGION\_BIT** specifies that dependencies will be [framebuffer-local](#).
- **VK\_DEPENDENCY\_VIEW\_LOCAL\_BIT** specifies that a [subpass has more than one view](#).
- **VK\_DEPENDENCY\_DEVICE\_GROUP\_BIT** specifies that dependencies are [non-device-local dependency](#).

```
typedef VkFlags VkDependencyFlags;
```

[VkDependencyFlags](#) is a bitmask type for setting a mask of zero or more [VkDependencyFlagBits](#).

### 6.6.1. Subpass Self-dependency

If [vkCmdPipelineBarrier](#) is called inside a render pass instance, the following restrictions apply. For a given subpass to allow a pipeline barrier, the render pass **must** declare a *self-dependency* from that subpass to itself. That is, there **must** exist a [VkSubpassDependency](#) in the subpass dependency list for the render pass with [srcSubpass](#) and [dstSubpass](#) equal to that subpass index. More than one self-dependency **can** be declared for each subpass.

Self-dependencies **must** only include pipeline stage bits that are graphics stages. If any of the stages in [srcStages](#) are [framebuffer-space stages](#), [dstStages](#) **must** only contain [framebuffer-space stages](#). Additionally, [srcStages](#) **must** not contain [VK\\_PIPELINE\\_STAGE\\_BOTTOM\\_OF\\_PIPE\\_BIT](#) in a self-dependency.

If the source and destination stage masks both include framebuffer-space stages, then [dependencyFlags](#) **must** include [VK\\_DEPENDENCY\\_BY\\_REGION\\_BIT](#). If the subpass has more than one view, then [dependencyFlags](#) **must** include [VK\\_DEPENDENCY\\_VIEW\\_LOCAL\\_BIT](#).

A [vkCmdPipelineBarrier](#) command inside a render pass instance **must** be a *subset* of one of the self-dependencies of the subpass it is used in, meaning that the stage masks and access masks **must** each include only a subset of the bits of the corresponding mask in that self-dependency. If the self-dependency has [VK\\_DEPENDENCY\\_BY\\_REGION\\_BIT](#) or [VK\\_DEPENDENCY\\_VIEW\\_LOCAL\\_BIT](#) set, then so **must** the pipeline barrier. Pipeline barriers within a render pass instance **can** only be types [VkMemoryBarrier](#) or [VkImageMemoryBarrier](#). If a [VkImageMemoryBarrier](#) is used, the image and image subresource range specified in the barrier **must** be a subset of one of the image views used by the framebuffer in the current subpass. Additionally, [oldLayout](#) **must** be equal to [newLayout](#), and both the [srcQueueFamilyIndex](#) and [dstQueueFamilyIndex](#) **must** be [VK\\_QUEUE\\_FAMILY\\_IGNORED](#).

## 6.7. Memory Barriers

*Memory barriers* are used to explicitly control access to buffer and image subresource ranges. Memory barriers are used to [transfer ownership between queue families](#), [change image layouts](#), and define [availability and visibility operations](#). They explicitly define the [access types](#) and buffer and image subresource ranges that are included in the [access scopes](#) of a memory dependency that is created by a synchronization command that includes them.

### 6.7.1. Global Memory Barriers

Global memory barriers apply to memory accesses involving all memory objects that exist at the time of its execution.

The `VkMemoryBarrier` structure is defined as:

```
typedef struct VkMemoryBarrier {  
    VkStructureType    sType;  
    const void*        pNext;  
    VkAccessFlags      srcAccessMask;  
    VkAccessFlags      dstAccessMask;  
} VkMemoryBarrier;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [source access mask](#).
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [destination access mask](#).

The first [access scope](#) is limited to access types in the [source access mask](#) specified by `srcAccessMask`.

The second [access scope](#) is limited to access types in the [destination access mask](#) specified by `dstAccessMask`.

#### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_BARRIER`
- `pNext` **must** be `NULL`
- `srcAccessMask` **must** be a valid combination of `VkAccessFlagBits` values
- `dstAccessMask` **must** be a valid combination of `VkAccessFlagBits` values

### 6.7.2. Buffer Memory Barriers

Buffer memory barriers only apply to memory accesses involving a specific buffer range. That is, a memory dependency formed from a buffer memory barrier is [scoped](#) to access via the specified buffer range. Buffer memory barriers [can](#) also be used to define a [queue family ownership transfer](#)

for the specified buffer range.

The `VkBufferMemoryBarrier` structure is defined as:

```
typedef struct VkBufferMemoryBarrier {  
    VkStructureType    sType;  
    const void*        pNext;  
    VkAccessFlags      srcAccessMask;  
    VkAccessFlags      dstAccessMask;  
    uint32_t           srcQueueFamilyIndex;  
    uint32_t           dstQueueFamilyIndex;  
    VkBuffer           buffer;  
    VkDeviceSize       offset;  
    VkDeviceSize       size;  
} VkBufferMemoryBarrier;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [source access mask](#).
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [destination access mask](#).
- `srcQueueFamilyIndex` is the source queue family for a [queue family ownership transfer](#).
- `dstQueueFamilyIndex` is the destination queue family for a [queue family ownership transfer](#).
- `buffer` is a handle to the buffer whose backing memory is affected by the barrier.
- `offset` is an offset in bytes into the backing memory for `buffer`; this is relative to the base offset as bound to the buffer (see [vkBindBufferMemory](#)).
- `size` is a size in bytes of the affected area of backing memory for `buffer`, or `VK_WHOLE_SIZE` to use the range from `offset` to the end of the buffer.

The first [access scope](#) is limited to access to memory through the specified buffer range, via access types in the [source access mask](#) specified by `srcAccessMask`. If `srcAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT`, memory writes performed by that access type are also made visible, as that access type is not performed through a resource.

The second [access scope](#) is limited to access to memory through the specified buffer range, via access types in the [destination access mask](#) specified by `dstAccessMask`. If `dstAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT` or `VK_ACCESS_HOST_READ_BIT`, available memory writes are also made visible to accesses of those types, as those access types are not performed through a resource.

If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, and `srcQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a [queue family release operation](#) for the specified buffer range, and the second access scope includes no access, as if `dstAccessMask` was `0`.

If `dstQueueFamilyIndex` is not equal to `srcQueueFamilyIndex`, and `dstQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a [queue family acquire operation](#) for the specified buffer range, and the first access scope includes no access, as if `srcAccessMask` was `0`.

## Valid Usage

- `offset` **must** be less than the size of `buffer`
- If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be greater than `0`
- If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be less than or equal to than the size of `buffer` minus `offset`
- If `buffer` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, at least one of `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_IGNORED`
- If `buffer` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, and one of `srcQueueFamilyIndex` and `dstQueueFamilyIndex` is `VK_QUEUE_FAMILY_IGNORED`, the other **must** be `VK_QUEUE_FAMILY_IGNORED` or a special queue family reserved for external memory ownership transfers, as described in [Queue Family Ownership Transfer](#).
- If `buffer` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE` and `srcQueueFamilyIndex` is `VK_QUEUE_FAMILY_IGNORED`, `dstQueueFamilyIndex` **must** also be `VK_QUEUE_FAMILY_IGNORED`
- If `buffer` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE` and `srcQueueFamilyIndex` is not `VK_QUEUE_FAMILY_IGNORED`, it **must** be a valid queue family or a special queue family reserved for external memory transfers, as described in [Queue Family Ownership Transfer](#).
- If `buffer` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE` and `dstQueueFamilyIndex` is not `VK_QUEUE_FAMILY_IGNORED`, it **must** be a valid queue family or a special queue family reserved for external memory transfers, as described in [Queue Family Ownership Transfer](#).
- If `buffer` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not `VK_QUEUE_FAMILY_IGNORED`, at least one of them **must** be the same as the family of the queue that will execute this barrier
- If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER`
- `pNext` **must** be `NULL`
- `buffer` **must** be a valid `VkBuffer` handle

### 6.7.3. Image Memory Barriers

Image memory barriers only apply to memory accesses involving a specific image subresource range. That is, a memory dependency formed from an image memory barrier is [scoped](#) to access via the specified image subresource range. Image memory barriers [can](#) also be used to define [image layout transitions](#) or a [queue family ownership transfer](#) for the specified image subresource

range.

The `VkImageMemoryBarrier` structure is defined as:

```
typedef struct VkImageMemoryBarrier {
    VkStructureType           sType;
    const void*               pNext;
    VkAccessFlags              srcAccessMask;
    VkAccessFlags              dstAccessMask;
    VkImageLayout                oldLayout;
    VkImageLayout                newLayout;
    uint32_t                     srcQueueFamilyIndex;
    uint32_t                     dstQueueFamilyIndex;
    VkImage                      image;
    VkImageSubresourceRange      subresourceRange;
} VkImageMemoryBarrier;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a `source access mask`.
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a `destination access mask`.
- `oldLayout` is the old layout in an `image layout transition`.
- `newLayout` is the new layout in an `image layout transition`.
- `srcQueueFamilyIndex` is the source queue family for a `queue family ownership transfer`.
- `dstQueueFamilyIndex` is the destination queue family for a `queue family ownership transfer`.
- `image` is a handle to the image affected by this barrier.
- `subresourceRange` describes the `image subresource range` within `image` that is affected by this barrier.

The first `access scope` is limited to access to memory through the specified image subresource range, via access types in the `source access mask` specified by `srcAccessMask`. If `srcAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT`, memory writes performed by that access type are also made visible, as that access type is not performed through a resource.

The second `access scope` is limited to access to memory through the specified image subresource range, via access types in the `destination access mask` specified by `dstAccessMask`. If `dstAccessMask` includes `VK_ACCESS_HOST_WRITE_BIT` or `VK_ACCESS_HOST_READ_BIT`, available memory writes are also made visible to accesses of those types, as those access types are not performed through a resource.

If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, and `srcQueueFamilyIndex` is equal to the current queue family, then the memory barrier defines a `queue family release operation` for the specified image subresource range, and the second access scope includes no access, as if `dstAccessMask` was `0`.

If `dstQueueFamilyIndex` is not equal to `srcQueueFamilyIndex`, and `dstQueueFamilyIndex` is equal to the

current queue family, then the memory barrier defines a [queue family acquire operation](#) for the specified image subresource range, and the first access scope includes no access, as if `srcAccessMask` was `0`.

If `oldLayout` is not equal to `newLayout`, then the memory barrier defines an [image layout transition](#) for the specified image subresource range.

Layout transitions that are performed via image memory barriers execute in their entirety in [submission order](#), relative to other image layout transitions submitted to the same queue, including those performed by [render passes](#). In effect there is an implicit execution dependency from each such layout transition to all layout transitions previously submitted to the same queue.

The image layout of each image subresource of a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus when the `image` member of a `VkImageMemoryBarrier` is an image created with this flag the application **can** chain a `VkSampleLocationsInfoEXT` structure to the `pNext` chain of `VkImageMemoryBarrier` to specify the sample locations to use during the image layout transition.

If the `VkSampleLocationsInfoEXT` structure in the `pNext` chain of `VkImageMemoryBarrier` does not match the sample location state last used to render to the image subresource range specified by `subresourceRange` or if no `VkSampleLocationsInfoEXT` structure is in the `pNext` chain of `VkImageMemoryBarrier` then the contents of the given image subresource range becomes undefined as if `oldLayout` would equal `VK_IMAGE_LAYOUT_UNDEFINED`.

If `image` has a multi-planar format and the image is *disjoint*, then including `VK_IMAGE_ASPECT_COLOR_BIT` in the `aspectMask` member of `subresourceRange` is equivalent to including `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, and (for three-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`.

## Valid Usage

- `oldLayout` **must** be `VK_IMAGE_LAYOUT_UNDEFINED` or the current layout of the image subresources affected by the barrier
- `newLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`
- If `image` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, at least one of `srcQueueFamilyIndex` and `dstQueueFamilyIndex` **must** be `VK_QUEUE_FAMILY_IGNORED`
- If `image` was created with a sharing mode of `VK_SHARING_MODE_CONCURRENT`, and one of `srcQueueFamilyIndex` and `dstQueueFamilyIndex` is `VK_QUEUE_FAMILY_IGNORED`, the other **must** be `VK_QUEUE_FAMILY_IGNORED` or a special queue family reserved for external memory transfers, as described in [Queue Family Ownership Transfer](#).
- If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE` and `srcQueueFamilyIndex` is `VK_QUEUE_FAMILY_IGNORED`, `dstQueueFamilyIndex` **must** also be `VK_QUEUE_FAMILY_IGNORED`.
- If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE` and `srcQueueFamilyIndex` is not `VK_QUEUE_FAMILY_IGNORED`, it **must** be a valid queue family or a special queue family reserved for external memory transfers, as described in [Queue Family Ownership Transfer](#).
- If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE` and `dstQueueFamilyIndex` is not `VK_QUEUE_FAMILY_IGNORED`, it **must** be a valid queue family or a special queue family reserved for external memory transfers, as described in [Queue Family Ownership Transfer](#).
- If `image` was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not `VK_QUEUE_FAMILY_IGNORED`, at least one of them **must** be the same as the family of the queue that will execute this barrier
- `subresourceRange.baseMipLevel` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` **must** be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- `subresourceRange.baseArrayLayer` **must** be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.baseArrayLayer + subresourceRange.layerCount` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is enabled, then the `aspectMask` member of `subresourceRange` **must** include either or both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`
- If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is not enabled, then the `aspectMask` member of `subresourceRange` **must** include both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`

- If `image` has a single-plane color format or is not *disjoint*, then the `aspectMask` member of `subresourceRange` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`
- If `image` has a multi-planar format and the image is *disjoint*, then the `aspectMask` member of `subresourceRange` **must** include either at least one of `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, and `VK_IMAGE_ASPECT_PLANE_2_BIT`; or **must** include `VK_IMAGE_ASPECT_COLOR_BIT`
- If `image` has a multi-planar format with only two planes, then the `aspectMask` member of `subresourceRange` **must** not include `VK_IMAGE_ASPECT_PLANE_2_BIT`
- If either `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` set
- If either `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set
- If either `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set
- If either `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set
- If either `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` set
- If either `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` set
- If either `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` set
- If either `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then `image` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` set
- If `image` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- If either `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV` then `image` **must** have been created with `VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV` set

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER`
- `pNext` **must** be `NULL` or a pointer to a valid instance of `VkSampleLocationsInfoEXT`
- `oldLayout` **must** be a valid `VkImageLayout` value
- `newLayout` **must** be a valid `VkImageLayout` value
- `image` **must** be a valid `VkImage` handle
- `subresourceRange` **must** be a valid `VkImageSubresourceRange` structure

### 6.7.4. Queue Family Ownership Transfer

Resources created with a `VkSharingMode` of `VK_SHARING_MODE_EXCLUSIVE` **must** have their ownership explicitly transferred from one queue family to another in order to access their content in a well-defined manner on a queue in a different queue family. Resources shared with external APIs or instances using external memory **must** also explicitly manage ownership transfers between local and external queues (or equivalent constructs in external APIs) regardless of the `VkSharingMode` specified when creating them. The special queue family index `VK_QUEUE_FAMILY_EXTERNAL` represents any queue external to the resource's current Vulkan instance, as long as the queue uses the same underlying physical device or device group and uses the same driver version as the resource's `VkDevice`, as indicated by `VkPhysicalDeviceIDProperties::deviceUUID` and `VkPhysicalDeviceIDProperties::driverUUID`. The special queue family index `VK_QUEUE_FAMILY_FOREIGN_EXT` represents any queue external to the resource's current Vulkan instance, regardless of the queue's underlying physical device or driver version. This includes, for example, queues for fixed-function image processing devices, media codec devices, and display devices, as well as all queues that use the same underlying physical device (or device group) and driver version as the resource's `VkDevice`. If memory dependencies are correctly expressed between uses of such a resource between two queues in different families, but no ownership transfer is defined, the contents of that resource are undefined for any read accesses performed by the second queue family.

*Note*

If an application does not need the contents of a resource to remain valid when transferring from one queue family to another, then the ownership transfer **should** be skipped.

*Note*

Applications should expect transfers to/from `VK_QUEUE_FAMILY_FOREIGN_EXT` to be more expensive than transfers to/from `VK_QUEUE_FAMILY_EXTERNAL_KHR`.

A queue family ownership transfer consists of two distinct parts:

1. Release exclusive ownership from the source queue family
2. Acquire exclusive ownership for the destination queue family

An application **must** ensure that these operations occur in the correct order by defining an execution dependency between them, e.g. using a semaphore.

A *release operation* is used to release exclusive ownership of a range of a buffer or image subresource range. A release operation is defined by executing a [buffer memory barrier](#) (for a buffer range) or an [image memory barrier](#) (for an image subresource range) using `vkCmdPipelineBarrier`, on a queue from the source queue family. The `srcQueueFamilyIndex` parameter of the barrier **must** be set to the source queue family index, and the `dstQueueFamilyIndex` parameter to the destination queue family index. `dstAccessMask` is ignored for such a barrier, such that no visibility operation is executed - the value of this mask does not affect the validity of the barrier. The release operation happens-after the availability operation, and happens-before operations specified in the second synchronization scope of the calling command.

An *acquire operation* is used to acquire exclusive ownership of a range of a buffer or image subresource range. An acquire operation is defined by executing a [buffer memory barrier](#) (for a buffer range) or an [image memory barrier](#) (for an image subresource range) using `vkCmdPipelineBarrier`, on a queue from the destination queue family. The buffer range or image subresource range specified in an acquire operation **must** match exactly that of a previous release operation. The `srcQueueFamilyIndex` parameter of the barrier **must** be set to the source queue family index, and the `dstQueueFamilyIndex` parameter to the destination queue family index. `srcAccessMask` is ignored for such a barrier, such that no availability operation is executed - the value of this mask does not affect the validity of the barrier. The acquire operation happens-after operations in the first synchronization scope of the calling command, and happens-before the visibility operation.

*Note*

Whilst it is not invalid to provide destination or source access masks for memory barriers used for release or acquire operations, respectively, they have no practical effect. Access after a release operation has undefined results, and so visibility for those accesses has no practical effect. Similarly, write access before an acquire operation will produce undefined results for future access, so availability of those writes has no practical use. In an earlier version of the specification, these were required to match on both sides - but this was subsequently relaxed. These masks **should** be set to 0.

If the transfer is via an image memory barrier, and an [image layout transition](#) is desired, then the values of `oldLayout` and `newLayout` in the release memory barrier **must** be equal to values of `oldLayout` and `newLayout` in the acquire memory barrier. Although the image layout transition is submitted twice, it will only be executed once. A layout transition specified in this way happens-after the release operation and happens-before the acquire operation.

If the values of `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are equal, no ownership transfer is performed, and the barrier operates as if they were both set to `VK_QUEUE_FAMILY_IGNORED`.

Queue family ownership transfers **may** perform read and write accesses on all memory bound to the image subresource or buffer range, so applications **must** ensure that all memory writes have been made [available](#) before a queue family ownership transfer is executed. Available memory is automatically made visible to queue family release and acquire operations, and writes performed by those operations are automatically made available.

Once a queue family has acquired ownership of a buffer range or image subresource range of a `VK_SHARING_MODE_EXCLUSIVE` resource, its contents are undefined to other queue families unless ownership is transferred. The contents of any portion of another resource which aliases memory that is bound to the transferred buffer or image subresource range are undefined after a release or acquire operation.

*Note*

Because `events` **cannot** be used directly for inter-queue synchronization, and because `vkCmdSetEvent` does not have the queue family index or memory barrier parameters needed by a *release operation*, the release and acquire operations of a queue family ownership transfer **can** only be performed using `vkCmdPipelineBarrier`.

## 6.8. Wait Idle Operations

To wait on the host for the completion of outstanding queue operations for a given queue, call:

```
VkResult vkQueueWaitIdle(  
    VkQueue  
        queue);
```

- `queue` is the queue on which to wait.

`vkQueueWaitIdle` is equivalent to submitting a fence to a queue and waiting with an infinite timeout for that fence to signal.

### Valid Usage (Implicit)

- `queue` **must** be a valid `VkQueue` handle

### Host Synchronization

- Host access to `queue` **must** be externally synchronized

### Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
-	-	Any	-

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

To wait on the host for the completion of outstanding queue operations for all queues on a given logical device, call:

```
VkResult vkDeviceWaitIdle(  
    VkDevice                device);
```

- `device` is the logical device to idle.

`vkDeviceWaitIdle` is equivalent to calling `vkQueueWaitIdle` for all queues owned by `device`.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle

## Host Synchronization

- Host access to all `VkQueue` objects created from `device` **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

## 6.9. Host Write Ordering Guarantees

When batches of command buffers are submitted to a queue via `vkQueueSubmit`, it defines a memory dependency with prior host operations, and execution of command buffers submitted to

the queue.

The first [synchronization scope](#) is defined by the host execution model, but includes execution of `vkQueueSubmit` on the host and anything that happened-before it.

The second [synchronization scope](#) includes all commands submitted in the same [queue submission](#), and all commands that occur later in [submission order](#).

The first [access scope](#) includes all host writes to mappable device memory that are available to the host memory domain.

The second [access scope](#) includes all memory access performed by the device.

## 6.10. Synchronization and Multiple Physical Devices

If a logical device includes more than one physical device, then fences, semaphores, and events all still have a single instance of the signaled state.

A fence becomes signaled when all physical devices complete the necessary queue operations.

Semaphore wait and signal operations all include a device index that is the sole physical device that performs the operation. These indices are provided in the [VkDeviceGroupSubmitInfo](#) and [VkDeviceGroupBindSparseInfo](#) structures. Semaphores are not exclusively owned by any physical device. For example, a semaphore can be signaled by one physical device and then waited on by a different physical device.

An event **can** only be waited on by the same physical device that signaled it (or the host).

## 6.11. Calibrated timestamps

In order to be able to correlate the time a particular operation took place at on timelines of different time domains (e.g. a device operation vs a host operation), Vulkan allows querying calibrated timestamps from multiple time domains.

To query calibrated timestamps from a set of time domains, call:

```
VkResult vkGetCalibratedTimestampsEXT(  
    VkDevice                                     device,  
    uint32_t                                      timestampCount,  
    const VkCalibratedTimestampInfoEXT*          pTimestampInfos,  
    uint64_t*                                     pTimestamps,  
    uint64_t*                                     pMaxDeviation);
```

- `device` is the logical device used to perform the query.
- `timestampCount` is the number of timestamps to query.
- `pTimestampInfos` is a pointer to an array of `timestampCount` [VkCalibratedTimestampInfoEXT](#) structures, describing the time domains the calibrated timestamps should be captured from.

- `pTimestamps` is a pointer to an array of `timestampCount` 64-bit unsigned integer values in which the requested calibrated timestamp values are returned.
- `pMaxDeviation` is a pointer to a 64-bit unsigned integer value in which the strictly positive maximum deviation, in nanoseconds, of the calibrated timestamp values is returned.

**Note**

The maximum deviation **may** vary between calls to `vkGetCalibratedTimestampsEXT` even for the same set of time domains due to implementation and platform specific reasons. It is the application's responsibility to assess whether the returned maximum deviation makes the timestamp values suitable for any particular purpose and **can** choose to re-issue the timestamp calibration call pursuing a lower deviation value.

Calibrated timestamp values **can** be extrapolated to estimate future coinciding timestamp values, however, depending on the nature of the time domains and other properties of the platform extrapolating values over a sufficiently long period of time **may** no longer be accurate enough to fit any particular purpose so applications are expected to re-calibrate the timestamps on a regular basis.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pTimestampInfos` **must** be a valid pointer to an array of `timestampCount` valid `VkCalibratedTimestampInfoEXT` structures
- `pTimestamps` **must** be a valid pointer to an array of `timestampCount uint64_t` values
- `pMaxDeviation` **must** be a valid pointer to a `uint64_t` value
- `timestampCount` **must** be greater than 0

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCalibratedTimestampInfoEXT` structure is defined as:

```
typedef struct VkCalibratedTimestampInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkTimeDomainEXT timeDomain;
} VkCalibratedTimestampInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `timeDomain` is a `VkTimeDomainEXT` value specifying the time domain from which the calibrated timestamp value should be returned.

## Valid Usage

- `timeDomain` **must** be one of the `VkTimeDomainEXT` values returned by `vkGetPhysicalDeviceCalibrateableTimeDomainsEXT`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_CALIBRATED_TIMESTAMP_INFO_EXT`
- `pNext` **must** be `NULL`
- `timeDomain` **must** be a valid `VkTimeDomainEXT` value

The set of supported time domains consists of:

```
typedef enum VkTimeDomainEXT {
    VK_TIME_DOMAIN_DEVICE_EXT = 0,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_EXT = 1,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_EXT = 2,
    VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_EXT = 3,
    VK_TIME_DOMAIN_MAX_ENUM_EXT = 0x7FFFFFFF
} VkTimeDomainEXT;
```

- `VK_TIME_DOMAIN_DEVICE_EXT` specifies the device time domain. Timestamp values in this time domain use the same units and are comparable with device timestamp values captured using `vkCmdWriteTimestamp` and are defined to be incrementing according to the `timestampPeriod` of the device.
- `VK_TIME_DOMAIN_CLOCK_MONOTONIC_EXT` specifies the `CLOCK_MONOTONIC` time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX `clock_gettime` API as computed by this example:

```
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

- `VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_EXT` specifies the `CLOCK_MONOTONIC_RAW` time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX `clock_gettime` API as computed by this example:

```
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC_RAW, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

- `VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_EXT` specifies the performance counter (QPC) time domain available on Windows. Timestamp values in this time domain are in the same units as those provided by the Windows `QueryPerformanceCounter` API and are comparable with platform timestamp values captured using that API as computed by this example:

```
LARGE_INTEGER counter;
QueryPerformanceCounter(&counter);
return counter.QuadPart;
```

# Chapter 7. Render Pass

A *render pass* represents a collection of attachments, subpasses, and dependencies between the subpasses, and describes how the attachments are used over the course of the subpasses. The use of a render pass in a command buffer is a *render pass instance*.

Render passes are represented by `VkRenderPass` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkRenderPass)
```

An *attachment description* describes the properties of an attachment including its format, sample count, and how its contents are treated at the beginning and end of each render pass instance.

A *subpass* represents a phase of rendering that reads and writes a subset of the attachments in a render pass. Rendering commands are recorded into a particular subpass of a render pass instance.

A *subpass description* describes the subset of attachments that is involved in the execution of a subpass. Each subpass **can** read from some attachments as *input attachments*, write to some as *color attachments* or *depth/stencil attachments*, and perform *multisample resolve operations* to *resolve attachments*. A subpass description **can** also include a set of *preserve attachments*, which are attachments that are not read or written by the subpass but whose contents **must** be preserved throughout the subpass.

A subpass *uses an attachment* if the attachment is a color, depth/stencil, resolve, depth/stencil resolve, or input attachment for that subpass (as determined by the `pColorAttachments`, `pDepthStencilAttachment`, `pResolveAttachments`, `VkSubpassDescriptionDepthStencilResolveKHR::pDepthStencilResolveAttachment`, and `pInputAttachments` members of `VkSubpassDescription`, respectively). A subpass does not use an attachment if that attachment is preserved by the subpass. The *first use of an attachment* is in the lowest numbered subpass that uses that attachment. Similarly, the *last use of an attachment* is in the highest numbered subpass that uses that attachment.

The subpasses in a render pass all render to the same dimensions, and fragments for pixel (x,y,layer) in one subpass **can** only read attachment contents written by previous subpasses at that same (x,y,layer) location.

## Note

By describing a complete set of subpasses in advance, render passes provide the implementation an opportunity to optimize the storage and transfer of attachment data between subpasses.

In practice, this means that subpasses with a simple framebuffer-space dependency **may** be merged into a single tiled rendering pass, keeping the attachment data on-chip for the duration of a render pass instance. However, it is also quite common for a render pass to only contain a single subpass.

*Subpass dependencies* describe [execution and memory dependencies](#) between subpasses.

A *subpass dependency chain* is a sequence of subpass dependencies in a render pass, where the source subpass of each subpass dependency (after the first) equals the destination subpass of the previous dependency.

Execution of subpasses **may** overlap or execute out of order with regards to other subpasses, unless otherwise enforced by an execution dependency. Each subpass only respects [submission order](#) for commands recorded in the same subpass, and the `vkCmdBeginRenderPass` and `vkCmdEndRenderPass` commands that delimit the render pass - commands within other subpasses are not included. This affects most other [implicit ordering guarantees](#).

A render pass describes the structure of subpasses and attachments independent of any specific image views for the attachments. The specific image views that will be used for the attachments, and their dimensions, are specified in `VkFramebuffer` objects. Framebuffers are created with respect to a specific render pass that the framebuffer is compatible with (see [Render Pass Compatibility](#)). Collectively, a render pass and a framebuffer define the complete render target state for one or more subpasses as well as the algorithmic dependencies between the subpasses.

The various pipeline stages of the drawing commands for a given subpass **may** execute concurrently and/or out of order, both within and across drawing commands, whilst still respecting [pipeline order](#). However for a given (x,y,layer,sample) sample location, certain per-sample operations are performed in [rasterization order](#).

## 7.1. Render Pass Creation

To create a render pass, call:

```
VkResult vkCreateRenderPass(  
    VkDevice device,  
    const VkRenderPassCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkRenderPass* pRenderPass);
```

- `device` is the logical device that creates the render pass.
- `pCreateInfo` is a pointer to a `VkRenderPassCreateInfo` structure describing the parameters of the render pass.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pRenderPass` is a pointer to a `VkRenderPass` handle in which the resulting render pass object is returned.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkRenderPassCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pRenderPass` **must** be a valid pointer to a `VkRenderPass` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkRenderPassCreateInfo` structure is defined as:

```
typedef struct VkRenderPassCreateInfo {
    VkStructureType           sType;
    const void*                pNext;
    VkRenderPassCreateFlags     flags;
    uint32_t                  attachmentCount;
    const VkAttachmentDescription* pAttachments;
    uint32_t                  subpassCount;
    const VkSubpassDescription* pSubpasses;
    uint32_t                  dependencyCount;
    const VkSubpassDependency* pDependencies;
} VkRenderPassCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is reserved for future use.
- `attachmentCount` is the number of attachments used by this render pass.
- `pAttachments` is a pointer to an array of `attachmentCount` `VkAttachmentDescription` structures describing the attachments used by the render pass.
- `subpassCount` is the number of subpasses to create.
- `pSubpasses` is a pointer to an array of `subpassCount` `VkSubpassDescription` structures describing each subpass.
- `dependencyCount` is the number of memory dependencies between pairs of subpasses.

- `pDependencies` is a pointer to an array of `dependencyCount` `VkSubpassDependency` structures describing dependencies between pairs of subpasses.

*Note*

Care should be taken to avoid a data race here; if any subpasses access attachments with overlapping memory locations, and one of those accesses is a write, a subpass dependency needs to be included between them.

## Valid Usage

- If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, it **must** be less than `attachmentCount`
- For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.
- For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.
- For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.
- For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.
- If the `pNext` chain includes an instance of `VkRenderPassInputAttachmentAspectCreateInfo`, the `subpass` member of each element of its `pAspectReferences` member **must** be less than `subpassCount`
- If the `pNext` chain includes an instance of `VkRenderPassInputAttachmentAspectCreateInfo`, the `inputAttachmentIndex` member of each element of its `pAspectReferences` member **must** be less than the value of `inputAttachmentCount` in the member of `pSubpasses` identified by its `subpass` member
- If the `pNext` chain includes an instance of `VkRenderPassInputAttachmentAspectCreateInfo`, for any element of the `pInputAttachments` member of any element of `pSubpasses` where the `attachment` member is not `VK_ATTACHMENT_UNUSED`, the `aspectMask` member of the corresponding element of `VkRenderPassInputAttachmentAspectCreateInfo::pAspectReferences` **must** only include aspects that are present in images of the format specified by the element of `pAttachments` at `attachment`
- If the `pNext` chain includes an instance of `VkRenderPassMultiviewCreateInfo`, and its `subpassCount` member is not zero, that member **must** be equal to the value of `subpassCount`
- If the `pNext` chain includes an instance of `VkRenderPassMultiviewCreateInfo`, if its `dependencyCount` member is not zero, it **must** be equal to `dependencyCount`
- If the `pNext` chain includes an instance of `VkRenderPassMultiviewCreateInfo`, for each non-zero element of `pViewOffsets`, the `srcSubpass` and `dstSubpass` members of `pDependencies` at the same index **must** not be equal
- If the `pNext` chain includes an instance of `VkRenderPassMultiviewCreateInfo`, for any element of `pDependencies` with a `dependencyFlags` member that does not include

`VK_DEPENDENCY_VIEW_LOCAL_BIT`, the corresponding element of the `pViewOffsets` member of that `VkRenderPassMultiviewCreateInfo` instance **must** be `0`

- If the `pNext` chain includes an instance of `VkRenderPassMultiviewCreateInfo`, elements of its `pViewMasks` member **must** either all be `0`, or all not be `0`
- If the `pNext` chain includes an instance of `VkRenderPassMultiviewCreateInfo`, and each element of its `pViewMasks` member is `0`, the `dependencyFlags` member of each element of `pDependencies` **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`
- If the `pNext` chain includes an instance of `VkRenderPassMultiviewCreateInfo`, and each element of its `pViewMasks` member is `0`, `correlatedViewMaskCount` **must** be `0`
- If the `pNext` chain includes an instance of `VkRenderPassMultiviewCreateInfo`, each element of its `pViewMask` member **must** not have a bit set at an index greater than or equal to `VkPhysicalDeviceLimits::maxFramebufferLayers`
- For any element of `pDependencies`, if the `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `srcStageMask` member of that dependency **must** be a pipeline stage supported by the `pipeline` identified by the `pipelineBindPoint` member of the source subpass
- For any element of `pDependencies`, if the `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `dstStageMask` member of that dependency **must** be a pipeline stage supported by the `pipeline` identified by the `pipelineBindPoint` member of the destination subpass
- The `srcSubpass` member of each element of `pDependencies` **must** be less than `subpassCount`
- The `dstSubpass` member of each element of `pDependencies` **must** be less than `subpassCount`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkRenderPassFragmentDensityMapCreateInfoEXT`, `VkRenderPassInputAttachmentAspectCreateInfo`, or `VkRenderPassMultiviewCreateInfo`
- Each `sType` member in the `pNext` chain **must** be unique
- `flags` **must** be `0`
- If `attachmentCount` is not `0`, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkAttachmentDescription` structures
- `pSubpasses` **must** be a valid pointer to an array of `subpassCount` valid `VkSubpassDescription` structures
- If `dependencyCount` is not `0`, `pDependencies` **must** be a valid pointer to an array of `dependencyCount` valid `VkSubpassDependency` structures
- `subpassCount` **must** be greater than `0`

```
typedef VkFlags VkRenderPassCreateFlags;
```

`VkRenderPassCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

If the `VkRenderPassCreateInfo::pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, then that structure includes an array of view masks, view offsets, and correlation masks for the render pass.

The `VkRenderPassMultiviewCreateInfo` structure is defined as:

```
typedef struct VkRenderPassMultiviewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t subpassCount;
    const uint32_t* pViewMasks;
    uint32_t dependencyCount;
    const int32_t* pViewOffsets;
    uint32_t correlationMaskCount;
    const uint32_t* pCorrelationMasks;
} VkRenderPassMultiviewCreateInfo;
```

or the equivalent

```
typedef VkRenderPassMultiviewCreateInfo VkRenderPassMultiviewCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `subpassCount` is zero or the number of subpasses in the render pass.
- `pViewMasks` is a pointer to an array of `subpassCount` view masks, where each mask is a bitfield of view indices describing which views rendering is broadcast to in each subpass, when multiview is enabled. If `subpassCount` is zero, each view mask is treated as zero.
- `dependencyCount` is zero or the number of dependencies in the render pass.
- `pViewOffsets` is a pointer to an array of `dependencyCount` view offsets, one for each dependency. If `dependencyCount` is zero, each dependency's view offset is treated as zero. Each view offset controls which views in the source subpass the views in the destination subpass depend on.
- `correlationMaskCount` is zero or the number of correlation masks.
- `pCorrelationMasks` is a pointer to an array of `correlationMaskCount` view masks indicating sets of views that **may** be more efficient to render concurrently.

When a subpass uses a non-zero view mask, *multiview* functionality is considered to be enabled. Multiview is all-or-nothing for a render pass - that is, either all subpasses **must** have a non-zero view mask (though some subpasses **may** have only one view) or all **must** be zero. Multiview causes

all drawing and clear commands in the subpass to behave as if they were broadcast to each view, where a view is represented by one layer of the framebuffer attachments. All draws and clears are broadcast to each *view index* whose bit is set in the view mask. The view index is provided in the `ViewIndex` shader input variable, and color, depth/stencil, and input attachments all read/write the layer of the framebuffer corresponding to the view index.

If the view mask is zero for all subpasses, multiview is considered to be disabled and all drawing commands execute normally, without this additional broadcasting.

Some implementations **may** not support multiview in conjunction with [geometry shaders](#) or [tessellation shaders](#).

When multiview is enabled, the `VK_DEPENDENCY_VIEW_LOCAL_BIT` bit in a dependency **can** be used to express a view-local dependency, meaning that each view in the destination subpass depends on a single view in the source subpass. Unlike pipeline barriers, a subpass dependency **can** potentially have a different view mask in the source subpass and the destination subpass. If the dependency is view-local, then each view (`dstView`) in the destination subpass depends on the view `dstView + pViewOffsets[dependency]` in the source subpass. If there is not such a view in the source subpass, then this dependency does not affect that view in the destination subpass. If the dependency is not view-local, then all views in the destination subpass depend on all views in the source subpass, and the view offset is ignored. A non-zero view offset is not allowed in a self-dependency.

The elements of `pCorrelationMasks` are a set of masks of views indicating that views in the same mask **may** exhibit spatial coherency between the views, making it more efficient to render them concurrently. Correlation masks **must** not have a functional effect on the results of the multiview rendering.

When multiview is enabled, at the beginning of each subpass all non-render pass state is undefined. In particular, each time `vkCmdBeginRenderPass` or `vkCmdNextSubpass` is called the graphics pipeline **must** be bound, any relevant descriptor sets or vertex/index buffers **must** be bound, and any relevant dynamic state or push constants **must** be set before they are used.

A multiview subpass **can** declare that its shaders will write per-view attributes for all views in a single invocation, by setting the `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX` bit in the subpass description. The only supported per-view attributes are position and viewport mask, and per-view position and viewport masks are written to output array variables decorated with `PositionPerViewNV` and `ViewportMaskPerViewNV`, respectively. If `VK_NV_viewport_array2` is not supported and enabled, `ViewportMaskPerViewNV` **must** not be used. Values written to elements of `PositionPerViewNV` and `ViewportMaskPerViewNV` **must** not depend on the `ViewIndex`. The shader **must** also write to an output variable decorated with `Position`, and the value written to `Position` **must** equal the value written to `PositionPerViewNV[ViewIndex]`. Similarly, if `ViewportMaskPerViewNV` is written to then the shader **must** also write to an output variable decorated with `ViewportMaskNV`, and the value written to `ViewportMaskNV` **must** equal the value written to `ViewportMaskPerViewNV[ViewIndex]`. Implementations will either use values taken from `Position` and `ViewportMaskNV` and invoke the shader once for each view, or will use values taken from `PositionPerViewNV` and `ViewportMaskPerViewNV` and invoke the shader fewer times. The values written to `Position` and `ViewportMaskNV` **must** not depend on the values written to `PositionPerViewNV` and `ViewportMaskPerViewNV`, or vice versa (to allow compilers to eliminate the unused outputs). All attributes that do not have `*PerViewNV` counterparts **must** not depend on `ViewIndex`.

Per-view attributes are all-or-nothing for a subpass. That is, all pipelines compiled against a subpass that includes the `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX` bit **must** write per-view attributes to the `*PerViewNV[]` shader outputs, in addition to the non-per-view (e.g. `Position`) outputs. Pipelines compiled against a subpass that does not include this bit **must** not include the `*PerViewNV[]` outputs in their interfaces.

## Valid Usage

- Each view index **must** not be set in more than one element of `pCorrelationMasks`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_MULTIVIEW_CREATE_INFO`
- If `subpassCount` is not `0`, `pViewMasks` **must** be a valid pointer to an array of `subpassCount uint32_t` values
- If `dependencyCount` is not `0`, `pViewOffsets` **must** be a valid pointer to an array of `dependencyCount int32_t` values
- If `correlationMaskCount` is not `0`, `pCorrelationMasks` **must** be a valid pointer to an array of `correlationMaskCount uint32_t` values

If the `VkRenderPassCreateInfo::pNext` chain includes a `VkRenderPassFragmentDensityMapCreateInfoEXT` structure, then that structure includes a fragment density map attachment for the render pass.

The `VkRenderPassFragmentDensityMapCreateInfoEXT` structure is defined as:

```
typedef struct VkRenderPassFragmentDensityMapCreateInfoEXT {
    VkStructureType          sType;
    const void*               pNext;
    VkAttachmentReference     fragmentDensityMapAttachment;
} VkRenderPassFragmentDensityMapCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `fragmentDensityMapAttachment` is the fragment density map to use for the render pass.

The fragment density map attachment is read at an implementation-dependent time either by the host during `vkCmdBeginRenderPass` if the attachment's image view was not created with `flags` containing `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT`, or by the device when drawing commands in the renderpass execute `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.

If this structure is not present, it is as if `fragmentDensityMapAttachment` was given as `VK_ATTACHMENT_UNUSED`.

## Valid Usage

- If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` **must** be less than `VkRenderPassCreateInfo::attachmentCount`
- If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` **must** not be an element of `VkSubpassDescription::pInputAttachments`, `VkSubpassDescription::pColorAttachments`, `VkSubpassDescription::pResolveAttachments`, `VkSubpassDescription::pDepthStencilAttachment`, or `VkSubpassDescription::pPreserveAttachments` for any subpass
- If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `layout` **must** be equal to `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT`, or `VK_IMAGE_LAYOUT_GENERAL`
- If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` **must** reference an attachment with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_LOAD` or `VK_ATTACHMENT_LOAD_OP_DONT_CARE`.
- If `fragmentDensityMapAttachment` is not `VK_ATTACHMENT_UNUSED`, `fragmentDensityMapAttachment` **must** reference an attachment with a `storeOp` equal to `VK_ATTACHMENT_STORE_OP_DONT_CARE`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_FRAGMENT_DENSITY_MAP_CREATE_INFO_EXT`
- `fragmentDensityMapAttachment` **must** be a valid `VkAttachmentReference` structure

The `VkAttachmentDescription` structure is defined as:

```
typedef struct VkAttachmentDescription {
    VkAttachmentDescriptionFlags    flags;
    VkFormat                      format;
    VkSampleCountFlagBits         samples;
    VkAttachmentLoadOp            loadOp;
    VkAttachmentStoreOp           storeOp;
    VkAttachmentLoadOp            stencilLoadOp;
    VkAttachmentStoreOp           stencilStoreOp;
    VkImageLayout                  initialLayout;
    VkImageLayout                  finalLayout;
} VkAttachmentDescription;
```

- `flags` is a bitmask of `VkAttachmentDescriptionFlagBits` specifying additional properties of the attachment.
- `format` is a `VkFormat` value specifying the format of the image view that will be used for the attachment.
- `samples` is the number of samples of the image as defined in `VkSampleCountFlagBits`.
- `loadOp` is a `VkAttachmentLoadOp` value specifying how the contents of color and depth

components of the attachment are treated at the beginning of the subpass where it is first used.

- `storeOp` is a `VkAttachmentStoreOp` value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
- `stencilLoadOp` is a `VkAttachmentLoadOp` value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
- `stencilStoreOp` is a `VkAttachmentStoreOp` value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- `initialLayout` is the layout the attachment image subresource will be in when a render pass instance begins.
- `finalLayout` is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

If the attachment uses a color format, then `loadOp` and `storeOp` are used, and `stencilLoadOp` and `stencilStoreOp` are ignored. If the format has depth and/or stencil components, `loadOp` and `storeOp` apply only to the depth data, while `stencilLoadOp` and `stencilStoreOp` define how the stencil data is handled. `loadOp` and `stencilLoadOp` define the *load operations* that execute as part of the first subpass that uses the attachment. `storeOp` and `stencilStoreOp` define the *store operations* that execute as part of the last subpass that uses the attachment.

The load operation for each sample in an attachment happens-before any recorded command which accesses the sample in the first subpass where the attachment is used. Load operations for attachments with a depth/stencil format execute in the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` pipeline stage. Load operations for attachments with a color format execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.

The store operation for each sample in an attachment happens-after any recorded command which accesses the sample in the last subpass where the attachment is used. Store operations for attachments with a depth/stencil format execute in the `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stage. Store operations for attachments with a color format execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.

If an attachment is not used by any subpass, then `loadOp`, `storeOp`, `stencilStoreOp`, and `stencilLoadOp` are ignored, and the attachment's memory contents will not be modified by execution of a render pass instance.

The load and store operations apply on the first and last use of each view in the render pass, respectively. If a view index of an attachment is not included in the view mask in any subpass that uses it, then the load and store operations are ignored, and the attachment's memory contents will not be modified by execution of a render pass instance.

During a render pass instance, input/color attachments with color formats that have a component size of 8, 16, or 32 bits **must** be represented in the attachment's format throughout the instance. Attachments with other floating- or fixed-point color formats, or with depth components **may** be represented in a format with a precision higher than the attachment format, but **must** be represented with the same range. When such a component is loaded via the `loadOp`, it will be converted into an implementation-dependent format used by the render pass. Such components **must** be converted from the render pass format, to the format of the attachment, before they are

resolved or stored at the end of a render pass instance via `storeOp`. Conversions occur as described in [Numeric Representation and Computation](#) and [Fixed-Point Data Conversions](#).

If `flags` includes `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, then the attachment is treated as if it shares physical memory with another attachment in the same render pass. This information limits the ability of the implementation to reorder certain operations (like layout transitions and the `loadOp`) such that it is not improperly reordered against other uses of the same physical memory via a different attachment. This is described in more detail below.

## Valid Usage

- `finalLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`
- If the `separateDepthStencilLayouts` feature is not enabled, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR` or
- If the `separateDepthStencilLayouts` feature is not enabled, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR` or
- If `format` is a color format, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR` or
- If `format` is a color format, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR` or
- If `format` is a depth/stencil format which includes both depth and stencil aspects, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR` or
- If `format` is a depth/stencil format which includes both depth and stencil aspects, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR` or
- If `format` is a depth/stencil format which includes only the depth aspect, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR` or  
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR`
- If `format` is a depth/stencil format which includes only the depth aspect, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR` or  
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR`
- If `format` is a depth/stencil format which includes only the stencil aspect, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR` or  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`
- If `format` is a depth/stencil format which includes only the stencil aspect, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR` or  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`

## Valid Usage (Implicit)

- **flags** **must** be a valid combination of [VkAttachmentDescriptionFlagBits](#) values
- **format** **must** be a valid [VkFormat](#) value
- **samples** **must** be a valid [VkSampleCountFlagBits](#) value
- **loadOp** **must** be a valid [VkAttachmentLoadOp](#) value
- **storeOp** **must** be a valid [VkAttachmentStoreOp](#) value
- **stencilLoadOp** **must** be a valid [VkAttachmentLoadOp](#) value
- **stencilStoreOp** **must** be a valid [VkAttachmentStoreOp](#) value
- **initialLayout** **must** be a valid [VkImageLayout](#) value
- **finalLayout** **must** be a valid [VkImageLayout](#) value

To specify which aspects of an input attachment **can** be read add a [VkRenderPassInputAttachmentAspectCreateInfo](#) structure to the **pNext** chain of the [VkRenderPassCreateInfo](#) structure:

The [VkRenderPassInputAttachmentAspectCreateInfo](#) structure is defined as:

```
typedef struct VkRenderPassInputAttachmentAspectCreateInfo {
    VkStructureType           sType;
    const void*                pNext;
    uint32_t                  aspectReferenceCount;
    const VkInputAttachmentAspectReference* pAspectReferences;
} VkRenderPassInputAttachmentAspectCreateInfo;
```

or the equivalent

```
typedef VkRenderPassInputAttachmentAspectCreateInfo
VkRenderPassInputAttachmentAspectCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **aspectReferenceCount** is the number of elements in the **pAspectReferences** array.
- **pAspectReferences** is a pointer to an array of **aspectReferenceCount** [VkInputAttachmentAspectReference](#) structures describing which aspect(s) **can** be accessed for a given input attachment within a given subpass.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO`
- `pAspectReferences` **must** be a valid pointer to an array of `aspectReferenceCount` valid `VkInputAttachmentAspectReference` structures
- `aspectReferenceCount` **must** be greater than `0`

The `VkInputAttachmentAspectReference` structure specifies an aspect mask for a specific input attachment of a specific subpass in the render pass.

`subpass` and `inputAttachmentIndex` index into the render pass as:

```
pCreateInfo::pSubpasses[subpass].pInputAttachments[inputAttachmentIndex]
```

```
typedef struct VkInputAttachmentAspectReference {
    uint32_t          subpass;
    uint32_t          inputAttachmentIndex;
    VkImageAspectFlags aspectMask;
} VkInputAttachmentAspectReference;
```

or the equivalent

```
typedef VkInputAttachmentAspectReference VkInputAttachmentAspectReferenceKHR;
```

- `subpass` is an index into the `pSubpasses` array of the parent `VkRenderPassCreateInfo` structure.
- `inputAttachmentIndex` is an index into the `pInputAttachments` of the specified subpass.
- `aspectMask` is a mask of which aspect(s) **can** be accessed within the specified subpass.

## Valid Usage

- `aspectMask` **must** not include `VK_IMAGE_ASPECT_METADATA_BIT`
- `aspectMask` **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index `i`.

## Valid Usage (Implicit)

- `aspectMask` **must** be a valid combination of `VkImageAspectFlagBits` values
- `aspectMask` **must** not be `0`

An application **must** only access the specified aspect(s).

An application **can** access any aspect of an input attachment that does not have a specified aspect mask.

Bits which **can** be set in `VkAttachmentDescription::flags` describing additional properties of the attachment are:

```
typedef enum VkAttachmentDescriptionFlagBits {
    VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT = 0x00000001,
    VK_ATTACHMENT_DESCRIPTION_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkAttachmentDescriptionFlagBits;
```

- `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` specifies that the attachment aliases the same device memory as other attachments.

```
typedef VkFlags VkAttachmentDescriptionFlags;
```

`VkAttachmentDescriptionFlags` is a bitmask type for setting a mask of zero or more `VkAttachmentDescriptionFlagBits`.

Possible values of `VkAttachmentDescription::loadOp` and `stencilLoadOp`, specifying how the contents of the attachment are treated, are:

```
typedef enum VkAttachmentLoadOp {
    VK_ATTACHMENT_LOAD_OP_LOAD = 0,
    VK_ATTACHMENT_LOAD_OP_CLEAR = 1,
    VK_ATTACHMENT_LOAD_OP_DONT_CARE = 2,
    VK_ATTACHMENT_LOAD_OP_MAX_ENUM = 0x7FFFFFFF
} VkAttachmentLoadOp;
```

- `VK_ATTACHMENT_LOAD_OP_LOAD` specifies that the previous contents of the image within the render area will be preserved. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`.
- `VK_ATTACHMENT_LOAD_OP_CLEAR` specifies that the contents within the render area will be cleared to a uniform value, which is specified when a render pass instance is begun. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.
- `VK_ATTACHMENT_LOAD_OP_DONT_CARE` specifies that the previous contents within the area need not be preserved; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

Possible values of `VkAttachmentDescription::storeOp` and `stencilStoreOp`, specifying how the contents of the attachment are treated, are:

```

typedef enum VkAttachmentStoreOp {
    VK_ATTACHMENT_STORE_OP_STORE = 0,
    VK_ATTACHMENT_STORE_OP_DONT_CARE = 1,
    VK_ATTACHMENT_STORE_OP_MAX_ENUM = 0x7FFFFFFF
} VkAttachmentStoreOp;

```

- `VK_ATTACHMENT_STORE_OP_STORE` specifies the contents generated during the render pass and within the render area are written to memory. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.
- `VK_ATTACHMENT_STORE_OP_DONT_CARE` specifies the contents within the render area are not needed after rendering, and **may** be discarded; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

If a render pass uses multiple attachments that alias the same device memory, those attachments **must** each include the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` bit in their attachment description flags. Attachments aliasing the same memory occurs in multiple ways:

- Multiple attachments being assigned the same image view as part of framebuffer creation.
- Attachments using distinct image views that correspond to the same image subresource of an image.
- Attachments using views of distinct image subresources which are bound to overlapping memory ranges.

*Note*

Render passes **must** include subpass dependencies (either directly or via a subpass dependency chain) between any two subpasses that operate on the same attachment or aliasing attachments and those subpass dependencies **must** include execution and memory dependencies separating uses of the aliases, if at least one of those subpasses writes to one of the aliases. These dependencies **must** not include the `VK_DEPENDENCY_BY_REGION_BIT` if the aliases are views of distinct image subresources which overlap in memory.

Multiple attachments that alias the same memory **must** not be used in a single subpass. A given attachment index **must** not be used multiple times in a single subpass, with one exception: two subpass attachments **can** use the same attachment index if at least one use is as an input attachment and neither use is as a resolve or preserve attachment. In other words, the same view **can** be used simultaneously as an input and color or depth/stencil attachment, but **must** not be used as multiple color or depth/stencil attachments nor as resolve or preserve attachments. The precise set of valid scenarios is described in more detail [below](#).

If a set of attachments alias each other, then all except the first to be used in the render pass **must** use an `initialLayout` of `VK_IMAGE_LAYOUT_UNDEFINED`, since the earlier uses of the other aliases make their contents undefined. Once an alias has been used and a different alias has been used after it,

the first alias **must** not be used in any later subpasses. However, an application **can** assign the same image view to multiple aliasing attachment indices, which allows that image view to be used multiple times even if other aliases are used in between.

*Note*

Once an attachment needs the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` bit, there **should** be no additional cost of introducing additional aliases, and using these additional aliases **may** allow more efficient clearing of the attachments on multiple uses via `VK_ATTACHMENT_LOAD_OP_CLEAR`.

The `VkSubpassDescription` structure is defined as:

```
typedef struct VkSubpassDescription {
    VkSubpassDescriptionFlags      flags;
    VkPipelineBindPoint           pipelineBindPoint;
    uint32_t                      inputAttachmentCount;
    const VkAttachmentReference* pInputAttachments;
    uint32_t                      colorAttachmentCount;
    const VkAttachmentReference* pColorAttachments;
    const VkAttachmentReference* pResolveAttachments;
    const VkAttachmentReference* pDepthStencilAttachment;
    uint32_t                      preserveAttachmentCount;
    const uint32_t*                pPreserveAttachments;
} VkSubpassDescription;
```

- `flags` is a bitmask of `VkSubpassDescriptionFlagBits` specifying usage of the subpass.
- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying the pipeline type supported for this subpass.
- `inputAttachmentCount` is the number of input attachments.
- `pInputAttachments` is a pointer to an array of `VkAttachmentReference` structures defining the input attachments for this subpass and their layouts.
- `colorAttachmentCount` is the number of color attachments.
- `pColorAttachments` is a pointer to an array of `VkAttachmentReference` structures defining the color attachments for this subpass and their layouts.
- `pResolveAttachments` is an optional array of `colorAttachmentCount` `VkAttachmentReference` structures defining the resolve attachments for this subpass and their layouts.
- `pDepthStencilAttachment` is a pointer to a `VkAttachmentReference` structure specifying the depth/stencil attachment for this subpass and its layout.
- `preserveAttachmentCount` is the number of preserved attachments.
- `pPreserveAttachments` is a pointer to an array of `preserveAttachmentCount` render pass attachment indices identifying attachments that are not used by this subpass, but whose contents **must** be preserved throughout the subpass.

Each element of the `pInputAttachments` array corresponds to an input attachment index in a

fragment shader, i.e. if a shader declares an image variable decorated with a `InputAttachmentIndex` value of `X`, then it uses the attachment provided in `pInputAttachments[X]`. Input attachments **must** also be bound to the pipeline in a descriptor set. If the `attachment` member of any element of `pInputAttachments` is `VK_ATTACHMENT_UNUSED`, the application **must** not read from the corresponding input attachment index. Fragment shaders **can** use subpass input variables to access the contents of an input attachment at the fragment's (x, y, layer) framebuffer coordinates.

Each element of the `pColorAttachments` array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a `Location` value of `X`, then it uses the attachment provided in `pColorAttachments[X]`. If the `attachment` member of any element of `pColorAttachments` is `VK_ATTACHMENT_UNUSED`, writes to the corresponding location by a fragment are discarded.

If `pResolveAttachments` is not `NULL`, each of its elements corresponds to a color attachment (the element in `pColorAttachments` at the same index), and a multisample resolve operation is defined for each attachment. At the end of each subpass, multisample resolve operations read the subpass's color attachments, and resolve the samples for each pixel within the render area to the same pixel location in the corresponding resolve attachments, unless the resolve attachment index is `VK_ATTACHMENT_UNUSED`.

Similarly, if `VkSubpassDescriptionDepthStencilResolveKHR::pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, it corresponds to the depth/stencil attachment in `pDepthStencilAttachment`, and multisample resolve operations for depth and stencil are defined by `VkSubpassDescriptionDepthStencilResolveKHR::depthResolveMode` and `VkSubpassDescriptionDepthStencilResolveKHR::stencilResolveMode`, respectively. At the end of each subpass, multisample resolve operations read the subpass's depth/stencil attachment, and resolve the samples for each pixel to the same pixel location in the corresponding resolve attachment. If `VkSubpassDescriptionDepthStencilResolveKHR::depthResolveMode` is `VK_RESOLVE_MODE_NONE_KHR`, then the depth component of the resolve attachment is not written to and its contents are preserved. Similarly, if `VkSubpassDescriptionDepthStencilResolveKHR::stencilResolveMode` is `VK_RESOLVE_MODE_NONE_KHR`, then the stencil component of the resolve attachment is not written to and its contents are preserved. `VkSubpassDescriptionDepthStencilResolveKHR::depthResolveMode` is ignored if the `VkFormat` of the `pDepthStencilResolveAttachment` does not have a depth component. Similarly, `VkSubpassDescriptionDepthStencilResolveKHR::stencilResolveMode` is ignored if the `VkFormat` of the `pDepthStencilResolveAttachment` does not have a stencil component.

If the image subresource range referenced by the depth/stencil attachment is created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT`, then the multisample resolve operation uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pPostSubpassSampleLocations` for the subpass.

If `pDepthStencilAttachment` is `NULL`, or if its attachment index is `VK_ATTACHMENT_UNUSED`, it indicates that no depth/stencil attachment will be used in the subpass.

The contents of an attachment within the render area become undefined at the start of a subpass `S` if all of the following conditions are true:

- The attachment is used as a color, depth/stencil, or resolve attachment in any subpass in the

render pass.

- There is a subpass  $S_1$  that uses or preserves the attachment, and a subpass dependency from  $S_1$  to  $S$ .
- The attachment is not used or preserved in subpass  $S$ .

Once the contents of an attachment become undefined in subpass  $S$ , they remain undefined for subpasses in subpass dependency chains starting with subpass  $S$  until they are written again. However, they remain valid for subpasses in other subpass dependency chains starting with subpass  $S_1$  if those subpasses use or preserve the attachment.

## Valid Usage

- `pipelineBindPoint` **must** be `VK_PIPELINE_BIND_POINT_GRAPHICS`
- `colorAttachmentCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxColorAttachments`
- If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then `loadOp` **must** not be `VK_ATTACHMENT_LOAD_OP_CLEAR`
- If `pResolveAttachments` is not `NULL`, for each resolve attachment that is not `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must** not be `VK_ATTACHMENT_UNUSED`
- If `pResolveAttachments` is not `NULL`, for each resolve attachment that is not `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must** not have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` **must** have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` **must** have the same `VkFormat` as its corresponding color attachment
- All attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have the same sample count
- All attachments in `pInputAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have formats whose features contain at least one of `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.
- All attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have formats whose features contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`
- All attachments in `pResolveAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have formats whose features contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`
- If `pDepthStencilAttachment` is not `NULL` and the attachment is not `VK_ATTACHMENT_UNUSED` then it **must** have a format whose features contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`
- If the `VK_AMD_mixed_attachment_samples` extension is enabled, and all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have a sample count that is smaller than or equal to the sample count of `pDepthStencilAttachment` if it is not `VK_ATTACHMENT_UNUSED`
- If neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, and if `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED` and any attachments in `pColorAttachments` are not `VK_ATTACHMENT_UNUSED`, they **must** have the same sample count
- The `attachment` member of each element of `pPreserveAttachments` **must** not be `VK_ATTACHMENT_UNUSED`
- Each element of `pPreserveAttachments` **must** not also be an element of any other member

of the subpass description

- If any attachment is used by more than one `VkAttachmentReference` member, then each use **must** use the same `layout`
- If `flags` includes `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX`, it **must** also include `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX`.

## Valid Usage (Implicit)

- `flags` **must** be a valid combination of `VkSubpassDescriptionFlagBits` values
- `pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value
- If `inputAttachmentCount` is not `0`, `pInputAttachments` **must** be a valid pointer to an array of `inputAttachmentCount` valid `VkAttachmentReference` structures
- If `colorAttachmentCount` is not `0`, `pColorAttachments` **must** be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference` structures
- If `colorAttachmentCount` is not `0`, and `pResolveAttachments` is not `NULL`, `pResolveAttachments` **must** be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference` structures
- If `pDepthStencilAttachment` is not `NULL`, `pDepthStencilAttachment` **must** be a valid pointer to a valid `VkAttachmentReference` structure
- If `preserveAttachmentCount` is not `0`, `pPreserveAttachments` **must** be a valid pointer to an array of `preserveAttachmentCount` `uint32_t` values

Bits which **can** be set in `VkSubpassDescription::flags`, specifying usage of the subpass, are:

```
typedef enum VkSubpassDescriptionFlagBits {
    VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX = 0x00000001,
    VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX = 0x00000002,
    VK_SUBPASS_DESCRIPTION_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkSubpassDescriptionFlagBits;
```

- `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX` specifies that shaders compiled for this subpass write the attributes for all views in a single invocation of each vertex processing stage. All pipelines compiled against a subpass that includes this bit **must** write per-view attributes to the `*PerViewNV[]` shader outputs, in addition to the non-per-view (e.g. `Position`) outputs.
- `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX` specifies that shaders compiled for this subpass use per-view positions which only differ in value in the x component. Per-view viewport mask **can** also be used.

```
typedef VkFlags VkSubpassDescriptionFlags;
```

`VkSubpassDescriptionFlags` is a bitmask type for setting a mask of zero or more

The `VkSubpassDescriptionFlagBits`.

The `VkAttachmentReference` structure is defined as:

```
typedef struct VkAttachmentReference {
    uint32_t attachment;
    VkImageLayout layout;
} VkAttachmentReference;
```

- `attachment` is either an integer value identifying an attachment at the corresponding index in `VkRenderPassCreateInfo::pAttachments`, or `VK_ATTACHMENT_UNUSED` to signify that this attachment is not used.
- `layout` is a `VkImageLayout` value specifying the layout the attachment uses during the subpass.

## Valid Usage

- If `attachment` is not `VK_ATTACHMENT_UNUSED`, `layout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

## Valid Usage (Implicit)

- `layout` **must** be a valid `VkImageLayout` value

The `VkSubpassDependency` structure is defined as:

```
typedef struct VkSubpassDependency {
    uint32_t srcSubpass;
    uint32_t dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkDependencyFlags dependencyFlags;
} VkSubpassDependency;
```

- `srcSubpass` is the subpass index of the first subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `dstSubpass` is the subpass index of the second subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the `source stage mask`.
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the `destination stage mask`
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a `source access mask`.
- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a `destination access mask`.

- `dependencyFlags` is a bitmask of `VkDependencyFlagBits`.

If `srcSubpass` is equal to `dstSubpass` then the `VkSubpassDependency` describes a `subpass self-dependency`, and only constrains the pipeline barriers allowed within a subpass instance. Otherwise, when a render pass instance which includes a subpass dependency is submitted to a queue, it defines a memory dependency between the subpasses identified by `srcSubpass` and `dstSubpass`.

If `srcSubpass` is equal to `VK_SUBPASS_EXTERNAL`, the first `synchronization scope` includes commands that occur earlier in `submission order` than the `vkCmdBeginRenderPass` used to begin the render pass instance. Otherwise, the first set of commands includes all commands submitted as part of the subpass instance identified by `srcSubpass` and any load, store or multisample resolve operations on attachments used in `srcSubpass`. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the `source stage mask` specified by `srcStageMask`.

If `dstSubpass` is equal to `VK_SUBPASS_EXTERNAL`, the second `synchronization scope` includes commands that occur later in `submission order` than the `vkCmdEndRenderPass` used to end the render pass instance. Otherwise, the second set of commands includes all commands submitted as part of the subpass instance identified by `dstSubpass` and any load, store or multisample resolve operations on attachments used in `dstSubpass`. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`.

The first `access scope` is limited to access in the pipeline stages determined by the `source stage mask` specified by `srcStageMask`. It is also limited to access types in the `source access mask` specified by `srcAccessMask`.

The second `access scope` is limited to access in the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`. It is also limited to access types in the `destination access mask` specified by `dstAccessMask`.

The `availability and visibility operations` defined by a subpass dependency affect the execution of `image layout transitions` within the render pass.

*Note*

For non-attachment resources, the memory dependency expressed by subpass dependency is nearly identical to that of a [VkMemoryBarrier](#) (with matching `srcAccessMask/dstAccessMask` parameters) submitted as a part of a [vkCmdPipelineBarrier](#) (with matching `srcStageMask/dstStageMask` parameters). The only difference being that its scopes are limited to the identified subpasses rather than potentially affecting everything before and after.

For attachments however, subpass dependencies work more like a [VkImageMemoryBarrier](#) defined similarly to the [VkMemoryBarrier](#) above, the queue family indices set to `VK_QUEUE_FAMILY_IGNORED`, and layouts as follows:

- The equivalent to `oldLayout` is the attachment's layout according to the subpass description for `srcSubpass`.
- The equivalent to `newLayout` is the attachment's layout according to the subpass description for `dstSubpass`.

## Valid Usage

- If the `geometry shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- If the `geometry shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- If the `tessellation shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- If the `tessellation shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- `srcSubpass` **must** be less than or equal to `dstSubpass`, unless one of them is `VK_SUBPASS_EXTERNAL`, to avoid cyclic dependencies and ensure a valid execution order
- `srcSubpass` and `dstSubpass` **must** not both be equal to `VK_SUBPASS_EXTERNAL`
- If `srcSubpass` is equal to `dstSubpass` and not all of the stages in `srcStageMask` and `dstStageMask` are `framebuffer-space stages`, the `logically latest` pipeline stage in `srcStageMask` **must** be `logically earlier` than or equal to the `logically earliest` pipeline stage in `dstStageMask`
- Any access flag included in `srcAccessMask` **must** be supported by one of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)
- Any access flag included in `dstAccessMask` **must** be supported by one of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)
- If `srcSubpass` equals `dstSubpass`, and `srcStageMask` and `dstStageMask` both include a `framebuffer-space stage`, then `dependencyFlags` **must** include `VK_DEPENDENCY_BY_REGION_BIT`
- If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `srcSubpass` **must** not be equal to `VK_SUBPASS_EXTERNAL`
- If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `dstSubpass` **must** not be equal to `VK_SUBPASS_EXTERNAL`
- If `srcSubpass` equals `dstSubpass` and that subpass has more than one bit set in the view mask, then `dependencyFlags` **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`
- If the `mesh shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`
- If the `task shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`
- If the `mesh shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`
- If the `task shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`

## Valid Usage (Implicit)

- `srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- `srcStageMask` **must** not be `0`
- `dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- `dstStageMask` **must** not be `0`
- `srcAccessMask` **must** be a valid combination of `VkAccessFlagBits` values
- `dstAccessMask` **must** be a valid combination of `VkAccessFlagBits` values
- `dependencyFlags` **must** be a valid combination of `VkDependencyFlagBits` values

When multiview is enabled, the execution of the multiple views of one subpass **may** not occur simultaneously or even back-to-back, and rather **may** be interleaved with the execution of other subpasses. The load and store operations apply to attachments on a per-view basis. For example, an attachment using `VK_ATTACHMENT_LOAD_OP_CLEAR` will have each view cleared on first use, but the first use of one view may be temporally distant from the first use of another view.

*Note*

A good mental model for multiview is to think of a multiview subpass as if it were a collection of individual (per-view) subpasses that are logically grouped together and described as a single multiview subpass in the API. Similarly, a multiview attachment can be thought of like several individual attachments that happen to be layers in a single image. A view-local dependency between two multiview subpasses acts like a set of one-to-one dependencies between corresponding pairs of per-view subpasses. A view-global dependency between two multiview subpasses acts like a set of  $N \times M$  dependencies between all pairs of per-view subpasses in the source and destination. Thus, it is a more compact representation which also makes clear the commonality and reuse that is present between views in a subpass. This interpretation motivates the answers to questions like “when does the load op apply” - it is on the first use of each view of an attachment, as if each view were a separate attachment.

If any two subpasses of a render pass activate transform feedback to the same bound transform feedback buffers, a subpass dependency **must** be included (either directly or via some intermediate subpasses) between them.

If there is no subpass dependency from `VK_SUBPASS_EXTERNAL` to the first subpass that uses an attachment, then an implicit subpass dependency exists from `VK_SUBPASS_EXTERNAL` to the first subpass it is used in. The subpass dependency operates as if defined with the following parameters:

```

VkSubpassDependency implicitDependency = {
    .srcSubpass = VK_SUBPASS_EXTERNAL;
    .dstSubpass = firstSubpass; // First subpass attachment is used in
    .srcStageMask = VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT;
    .dstStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT;
    .srcAccessMask = 0;
    .dstAccessMask = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT |
                    VK_ACCESS_COLOR_ATTACHMENT_READ_BIT |
                    VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
                    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT |
                    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT;
    .dependencyFlags = 0;
};

```

Similarly, if there is no subpass dependency from the last subpass that uses an attachment to `VK_SUBPASS_EXTERNAL`, then an implicit subpass dependency exists from the last subpass it is used in to `VK_SUBPASS_EXTERNAL`. The subpass dependency operates as if defined with the following parameters:

```

VkSubpassDependency implicitDependency = {
    .srcSubpass = lastSubpass; // Last subpass attachment is used in
    .dstSubpass = VK_SUBPASS_EXTERNAL;
    .srcStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT;
    .dstStageMask = VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT;
    .srcAccessMask = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT |
                    VK_ACCESS_COLOR_ATTACHMENT_READ_BIT |
                    VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
                    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT |
                    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT;
    .dstAccessMask = 0;
    .dependencyFlags = 0;
};

```

As subpasses **may** overlap or execute out of order with regards to other subpasses unless a subpass dependency chain describes otherwise, the layout transitions required between subpasses **cannot** be known to an application. Instead, an application provides the layout that each attachment **must** be in at the start and end of a render pass, and the layout it **must** be in during each subpass it is used in. The implementation then **must** execute layout transitions between subpasses in order to guarantee that the images are in the layouts required by each subpass, and in the final layout at the end of the render pass.

Automatic layout transitions apply to the entire image subresource attached to the framebuffer. If the attachment view is a 2D or 2D array view of a 3D image, even if the attachment view only refers to a subset of the slices of the selected mip level of the 3D image, automatic layout transitions apply to the entire subresource referenced which is the entire mip level in this case.

Automatic layout transitions away from the layout used in a subpass happen-after the availability operations for all dependencies with that subpass as the `srcSubpass`.

Automatic layout transitions into the layout used in a subpass happen-before the visibility operations for all dependencies with that subpass as the `dstSubpass`.

Automatic layout transitions away from `initialLayout` happens-after the availability operations for all dependencies with a `srcSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `dstSubpass` uses the attachment that will be transitioned. For attachments created with `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, automatic layout transitions away from `initialLayout` happen-after the availability operations for all dependencies with a `srcSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `dstSubpass` uses any aliased attachment.

Automatic layout transitions into `finalLayout` happens-before the visibility operations for all dependencies with a `dstSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `srcSubpass` uses the attachment that will be transitioned. For attachments created with `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, automatic layout transitions into `finalLayout` happen-before the visibility operations for all dependencies with a `dstSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `srcSubpass` uses any aliased attachment.

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the attachment, thus automatic layout transitions use the sample locations state specified in [VkRenderPassSampleLocationsBeginInfoEXT](#).

Automatic layout transitions of an attachment referring to a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` use the sample locations the image subresource range referenced by the attachment was last rendered with. If the current render pass does not use the attachment as a depth/stencil attachment in any subpass that happens-before, the automatic layout transition uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pAttachmentInitialSampleLocations` array for which the `attachmentIndex` member equals the attachment index of the attachment, if one is specified. Otherwise, the automatic layout transition uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pPostSubpassSampleLocations` array for which the `subpassIndex` member equals the index of the subpass that last used the attachment as a depth/stencil attachment, if one is specified.

If no sample locations state has been specified for an automatic layout transition performed on an attachment referring to a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` the contents of the depth aspect of the depth/stencil attachment become undefined as if the layout of the attachment was transitioned from the `VK_IMAGE_LAYOUT_UNDEFINED` layout.

If two subpasses use the same attachment, and both subpasses use the attachment in a read-only layout, no subpass dependency needs to be specified between those subpasses. If an implementation treats those layouts separately, it **must** insert an implicit subpass dependency between those subpasses to separate the uses in each layout. The subpass dependency operates as if defined with the following parameters:

```

// Used for input attachments
VkPipelineStageFlags inputAttachmentStages = VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT;
VkAccessFlags inputAttachmentAccess = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT;

// Used for depth/stencil attachments
VkPipelineStageFlags depthStencilAttachmentStages =
VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT |
VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT;
VkAccessFlags depthStencilAttachmentAccess =
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT;

VkSubpassDependency implicitDependency = {
    .srcSubpass = firstSubpass;
    .dstSubpass = secondSubpass;
    .srcStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .dstStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .srcAccessMask = inputAttachmentAccess | depthStencilAttachmentAccess;
    .dstAccessMask = inputAttachmentAccess | depthStencilAttachmentAccess;
    .dependencyFlags = 0;
};

}

```

If a subpass uses the same attachment as both an input attachment and either a color attachment or a depth/stencil attachment, writes via the color or depth/stencil attachment are not automatically made visible to reads via the input attachment, causing a *feedback loop*, except in any of the following conditions:

- If the color components or depth/stencil components read by the input attachment are mutually exclusive with the components written by the color or depth/stencil attachments, then there is no feedback loop. This requires the graphics pipelines used by the subpass to disable writes to color components that are read as inputs via the `colorWriteMask`, and to disable writes to depth/stencil components that are read as inputs via `depthWriteEnable` or `stencilTestEnable`.
- If the attachment is used as an input attachment and depth/stencil attachment only, and the depth/stencil attachment is not written to.
- If a memory dependency is inserted between when the attachment is written and when it is subsequently read by later fragments. [Pipeline barriers](#) expressing a [subpass self-dependency](#) are the only way to achieve this, and one **must** be inserted every time a fragment will read values at a particular sample (x, y, layer, sample) coordinate, if those values have been written since the most recent pipeline barrier; or the since start of the subpass if there have been no pipeline barriers since the start of the subpass.

An attachment used as both an input attachment and a color attachment **must** be in the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` or `VK_IMAGE_LAYOUT_GENERAL` layout. An attachment used as an input attachment and depth/stencil attachment **must** be in the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL` layout. An attachment **must** not be used as both a depth/stencil attachment and a color attachment.

A more extensible version of render pass creation is also defined below.

To create a render pass, call:

```
VkResult vkCreateRenderPass2KHR(  
    VkDevice device,  
    const VkRenderPassCreateInfo2KHR* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkRenderPass* pRenderPass);
```

- `device` is the logical device that creates the render pass.
- `pCreateInfo` is a pointer to a `VkRenderPassCreateInfo2KHR` structure describing the parameters of the render pass.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pRenderPass` is a pointer to a `VkRenderPass` handle in which the resulting render pass object is returned.

This command is functionally identical to `vkCreateRenderPass`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkRenderPassCreateInfo2KHR` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pRenderPass` **must** be a valid pointer to a `VkRenderPass` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkRenderPassCreateInfo2KHR` structure is defined as:

```

typedef struct VkRenderPassCreateInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassCreateFlags flags;
    uint32_t attachmentCount;
    const VkAttachmentDescription2KHR* pAttachments;
    uint32_t subpassCount;
    const VkSubpassDescription2KHR* pSubpasses;
    uint32_t dependencyCount;
    const VkSubpassDependency2KHR* pDependencies;
    uint32_t correlatedViewMaskCount;
    const uint32_t* pCorrelatedViewMasks;
} VkRenderPassCreateInfo2KHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **flags** is reserved for future use.
- **attachmentCount** is the number of attachments used by this render pass.
- **pAttachments** is a pointer to an array of **attachmentCount** **VkAttachmentDescription2KHR** structures describing the attachments used by the render pass.
- **subpassCount** is the number of subpasses to create.
- **pSubpasses** is a pointer to an array of **subpassCount** **VkSubpassDescription2KHR** structures describing each subpass.
- **dependencyCount** is the number of dependencies between pairs of subpasses.
- **pDependencies** is a pointer to an array of **dependencyCount** **VkSubpassDependency2KHR** structures describing dependencies between pairs of subpasses.
- **correlatedViewMaskCount** is the number of correlation masks.
- **pCorrelatedViewMasks** is a pointer to an array of view masks indicating sets of views that **may** be more efficient to render concurrently.

Parameters defined by this structure with the same name as those in [VkRenderPassCreateInfo](#) have the identical effect to those parameters; the child structures are variants of those used in [VkRenderPassCreateInfo](#) which include **sType** and **pNext** parameters, allowing them to be extended.

If the [VkSubpassDescription2KHR::viewMask](#) member of any element of **pSubpasses** is not zero, *multiview* functionality is considered to be enabled for this render pass.

**correlatedViewMaskCount** and **pCorrelatedViewMasks** have the same effect as [VkRenderPassMultiviewCreateInfo::correlationMaskCount](#) and [VkRenderPassMultiviewCreateInfo::pCorrelationMasks](#), respectively.

## Valid Usage

- If any two subpasses operate on attachments with overlapping ranges of the same `VkDeviceMemory` object, and at least one subpass writes to that area of `VkDeviceMemory`, a subpass dependency **must** be included (either directly or via some intermediate subpasses) between them
- If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or the attachment indexed by any element of `pPreserveAttachments` in any given element of `pSubpasses` is bound to a range of a `VkDeviceMemory` object that overlaps with any other attachment in any subpass (including the same subpass), the `VkAttachmentDescription2KHR` structures describing them **must** include `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` in `flags`
- If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any given element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, it **must** be less than `attachmentCount`
- For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`
- For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.
- For any element of `pDependencies`, if the `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `srcStageMask` member of that dependency **must** be a pipeline stage supported by the `pipeline` identified by the `pipelineBindPoint` member of the source subpass
- For any element of `pDependencies`, if the `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `dstStageMask` member of that dependency **must** be a pipeline stage supported by the `pipeline` identified by the `pipelineBindPoint` member of the destination subpass
- The set of bits included in any element of `pCorrelatedViewMasks` **must** not overlap with the set of bits included in any other element of `pCorrelatedViewMasks`
- If the `VkSubpassDescription2KHR::viewMask` member of all elements of `pSubpasses` is `0`, `correlatedViewMaskCount` **must** be `0`
- The `VkSubpassDescription2KHR::viewMask` member of all elements of `pSubpasses` **must** either all be `0`, or all not be `0`
- If the `VkSubpassDescription2KHR::viewMask` member of all elements of `pSubpasses` is `0`, the `dependencyFlags` member of any element of `pDependencies` **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`
- For any element of `pDependencies` where its `srcSubpass` member equals its `dstSubpass`

member, if the `viewMask` member of the corresponding element of `pSubpasses` includes more than one bit, its `dependencyFlags` member **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- The `viewMask` member **must** not have a bit set at an index greater than or equal to `VkPhysicalDeviceLimits::maxFramebufferLayers`
- If the `attachment` member of any element of the `pInputAttachments` member of any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, the `aspectMask` member of that element of `pInputAttachments` **must** only include aspects that are present in images of the format specified by the element of `pAttachments` specified by `attachment`
- The `srcSubpass` member of each element of `pDependencies` **must** be less than `subpassCount`
- The `dstSubpass` member of each element of `pDependencies` **must** be less than `subpassCount`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO_2_KHR`
- `pNext` **must** be `NULL` or a pointer to a valid instance of `VkRenderPassFragmentDensityMapCreateInfoEXT`
- `flags` **must** be `0`
- If `attachmentCount` is not `0`, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkAttachmentDescription2KHR` structures
- `pSubpasses` **must** be a valid pointer to an array of `subpassCount` valid `VkSubpassDescription2KHR` structures
- If `dependencyCount` is not `0`, `pDependencies` **must** be a valid pointer to an array of `dependencyCount` valid `VkSubpassDependency2KHR` structures
- If `correlatedViewMaskCount` is not `0`, `pCorrelatedViewMasks` **must** be a valid pointer to an array of `correlatedViewMaskCount` `uint32_t` values
- `subpassCount` **must** be greater than `0`

The `VkAttachmentDescription2KHR` structure is defined as:

```

typedef struct VkAttachmentDescription2KHR {
    VkStructureType          sType;
    const void*             pNext;
    VkAttachmentDescriptionFlags flags;
    VkFormat                 format;
    VkSampleCountFlagBits    samples;
    VkAttachmentLoadOp       loadOp;
    VkAttachmentStoreOp      storeOp;
    VkAttachmentLoadOp       stencilLoadOp;
    VkAttachmentStoreOp      stencilStoreOp;
    VkImageLayout            initialLayout;
    VkImageLayout            finalLayout;
} VkAttachmentDescription2KHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **flags** is a bitmask of [VkAttachmentDescriptionFlagBits](#) specifying additional properties of the attachment.
- **format** is a [VkFormat](#) value specifying the format of the image that will be used for the attachment.
- **samples** is the number of samples of the image as defined in [VkSampleCountFlagBits](#).
- **loadOp** is a [VkAttachmentLoadOp](#) value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
- **storeOp** is a [VkAttachmentStoreOp](#) value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
- **stencilLoadOp** is a [VkAttachmentLoadOp](#) value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
- **stencilStoreOp** is a [VkAttachmentStoreOp](#) value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- **initialLayout** is the layout the attachment image subresource will be in when a render pass instance begins.
- **finalLayout** is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

Parameters defined by this structure with the same name as those in [VkAttachmentDescription](#) have the identical effect to those parameters.

If the **separateDepthStencilLayouts** feature is enabled, and **format** is a depth/stencil format, **initialLayout** and **finalLayout** **can** be set to a layout that only specifies the layout of the depth aspect.

If **format** is a depth/stencil format, and **initialLayout** only specifies the initial layout of the depth aspect of the attachment, the initial layout of the stencil aspect is specified by the **stencilInitialLayout** member of an instance of [VkAttachmentDescriptionStencilLayoutKHR](#) in the

`pNext` chain. Otherwise, `initialLayout` describes the initial layout for all relevant image aspects.

If `format` is a depth/stencil format, and `finalLayout` only specifies the final layout of the depth aspect of the attachment, the final layout of the stencil aspect is specified by the `stencilFinalLayout` member of an instance of `VkAttachmentDescriptionStencilLayoutKHR` in the `pNext` chain. Otherwise, `finalLayout` describes the final layout for all relevant image aspects.

## Valid Usage

- `finalLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`
- If the `separateDepthStencilLayouts` feature is not enabled, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR` or  
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR`
- If the `separateDepthStencilLayouts` feature is not enabled, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR` or  
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR`
- If `format` is a color format, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR` or  
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR`
- If `format` is a color format, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR` or  
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR`
- If `format` is a depth/stencil format which includes both depth and stencil aspects, and `initialLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`, the `pNext` chain **must** include a valid instance of `VkAttachmentDescriptionStencilLayoutKHR`
- If `format` is a depth/stencil format which includes both depth and stencil aspects, and `finalLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`, the `pNext` chain **must** include a valid instance of `VkAttachmentDescriptionStencilLayoutKHR`
- If `format` is a depth/stencil format which includes only the depth aspect, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR`
- If `format` is a depth/stencil format which includes only the depth aspect, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR`
- If `format` is a depth/stencil format which includes only the stencil aspect, `initialLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`
- If `format` is a depth/stencil format which includes only the stencil aspect, `finalLayout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`

## Valid Usage (Implicit)

- **sType** **must** be `VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_2_KHR`
- **flags** **must** be a valid combination of `VkAttachmentDescriptionFlagBits` values
- **format** **must** be a valid `VkFormat` value
- **samples** **must** be a valid `VkSampleCountFlagBits` value
- **loadOp** **must** be a valid `VkAttachmentLoadOp` value
- **storeOp** **must** be a valid `VkAttachmentStoreOp` value
- **stencilLoadOp** **must** be a valid `VkAttachmentLoadOp` value
- **stencilStoreOp** **must** be a valid `VkAttachmentStoreOp` value
- **initialLayout** **must** be a valid `VkImageLayout` value
- **finalLayout** **must** be a valid `VkImageLayout` value

The `VkAttachmentDescriptionStencilLayoutKHR` structure is defined as:

```
typedef struct VkAttachmentDescriptionStencilLayoutKHR {
    VkStructureType    sType;
    void*              pNext;
    VkImageLayout      stencilInitialLayout;
    VkImageLayout      stencilFinalLayout;
} VkAttachmentDescriptionStencilLayoutKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **stencilInitialLayout** is the layout the stencil aspect of the attachment image subresource will be in when a render pass instance begins.
- **stencilFinalLayout** is the layout the stencil aspect of the attachment image subresource will be transitioned to when a render pass instance ends.

## Valid Usage

- `stencilInitialLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`,  
`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`,  
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`,  
`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` or
- `stencilFinalLayout` **must** not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`,  
`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`,  
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`,  
`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` or
- `stencilFinalLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or  
`VK_IMAGE_LAYOUT_PREINITIALIZED`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_STENCIL_LAYOUT_KHR`
- `stencilInitialLayout` **must** be a valid `VkImageLayout` value
- `stencilFinalLayout` **must** be a valid `VkImageLayout` value

The `VkSubpassDescription2KHR` structure is defined as:

```
typedef struct VkSubpassDescription2KHR {
    VkStructureType             sType;
    const void*                 pNext;
    VkSubpassDescriptionFlags   flags;
    VkPipelineBindPoint         pipelineBindPoint;
    uint32_t                    viewMask;
    uint32_t                    inputAttachmentCount;
    const VkAttachmentReference2KHR* pInputAttachments;
    uint32_t                    colorAttachmentCount;
    const VkAttachmentReference2KHR* pColorAttachments;
    const VkAttachmentReference2KHR* pResolveAttachments;
    const VkAttachmentReference2KHR* pDepthStencilAttachment;
    uint32_t                    preserveAttachmentCount;
    const uint32_t*              pPreserveAttachments;
} VkSubpassDescription2KHR;
```

- `sType` is the type of this structure.

- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is a bitmask of `VkSubpassDescriptionFlagBits` specifying usage of the subpass.
- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying the pipeline type supported for this subpass.
- `viewMask` is a bitfield of view indices describing which views rendering is broadcast to in this subpass, when multiview is enabled.
- `inputAttachmentCount` is the number of input attachments.
- `pInputAttachments` is a pointer to an array of `VkAttachmentReference2KHR` structures defining the input attachments for this subpass and their layouts.
- `colorAttachmentCount` is the number of color attachments.
- `pColorAttachments` is a pointer to an array of `VkAttachmentReference2KHR` structures defining the color attachments for this subpass and their layouts.
- `pResolveAttachments` is an optional array of `colorAttachmentCount` `VkAttachmentReference2KHR` structures defining the resolve attachments for this subpass and their layouts.
- `pDepthStencilAttachment` is a pointer to a `VkAttachmentReference2KHR` structure specifying the depth/stencil attachment for this subpass and its layout.
- `preserveAttachmentCount` is the number of preserved attachments.
- `pPreserveAttachments` is a pointer to an array of `preserveAttachmentCount` render pass attachment indices identifying attachments that are not used by this subpass, but whose contents **must** be preserved throughout the subpass.

Parameters defined by this structure with the same name as those in `VkSubpassDescription` have the identical effect to those parameters.

`viewMask` has the same effect for the described subpass as `VkRenderPassMultiviewCreateInfo`  
`::pViewMasks` has on each corresponding subpass.

## Valid Usage

- `pipelineBindPoint` **must** be `VK_PIPELINE_BIND_POINT_GRAPHICS`
- `colorAttachmentCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxColorAttachments`
- If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then `loadOp` **must** not be `VK_ATTACHMENT_LOAD_OP_CLEAR`
- If `pResolveAttachments` is not `NULL`, for each resolve attachment that does not have the value `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must** not have the value `VK_ATTACHMENT_UNUSED`
- If `pResolveAttachments` is not `NULL`, for each resolve attachment that is not `VK_ATTACHMENT_UNUSED`, the corresponding color attachment **must** not have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- If `pResolveAttachments` is not `NULL`, each resolve attachment that is not `VK_ATTACHMENT_UNUSED` **must** have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- Any given element of `pResolveAttachments` **must** have the same `VkFormat` as its corresponding color attachment
- All attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have the same sample count
- If the `VK_AMD_mixed_attachment_samples` extension is enabled, all attachments in `pColorAttachments` that are not `VK_ATTACHMENT_UNUSED` **must** have a sample count that is smaller than or equal to the sample count of `pDepthStencilAttachment` if it is not `VK_ATTACHMENT_UNUSED`
- If neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, and if `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED` and any attachments in `pColorAttachments` are not `VK_ATTACHMENT_UNUSED`, they **must** have the same sample count
- The `attachment` member of any element of `pPreserveAttachments` **must** not be `VK_ATTACHMENT_UNUSED`
- Any given element of `pPreserveAttachments` **must** not also be an element of any other member of the subpass description
- If any attachment is used by more than one `VkAttachmentReference` member, then each use **must** use the same `layout`
- If `flags` includes `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX`, it **must** also include `VK_SUBPASS_DESCRIPTION_PER_VIEW_ATTRIBUTES_BIT_NVX`.
- If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** be a valid combination of `VkImageAspectFlagBits`
- If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** not be `0`
- If the `attachment` member of any element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, then the `aspectMask` member **must** not include `VK_IMAGE_ASPECT_METADATA_BIT`

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_2_KHR`
- `flags` must be a valid combination of `VkSubpassDescriptionFlagBits` values
- `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value
- If `inputAttachmentCount` is not `0`, `pInputAttachments` must be a valid pointer to an array of `inputAttachmentCount` valid `VkAttachmentReference2KHR` structures
- If `colorAttachmentCount` is not `0`, `pColorAttachments` must be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference2KHR` structures
- If `colorAttachmentCount` is not `0`, and `pResolveAttachments` is not `NULL`, `pResolveAttachments` must be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference2KHR` structures
- If `pDepthStencilAttachment` is not `NULL`, `pDepthStencilAttachment` must be a valid pointer to a valid `VkAttachmentReference2KHR` structure
- If `preserveAttachmentCount` is not `0`, `pPreserveAttachments` must be a valid pointer to an array of `preserveAttachmentCount` `uint32_t` values

If the `pNext` list of `VkSubpassDescription2KHR` includes a `VkSubpassDescriptionDepthStencilResolveKHR` structure, then that structure describes multisample resolve operations for the depth/stencil attachment in a subpass.

The `VkSubpassDescriptionDepthStencilResolveKHR` structure is defined as:

```
typedef struct VkSubpassDescriptionDepthStencilResolveKHR {  
    VkStructureType           sType;  
    const void*               pNext;  
    VkResolveModeFlagBitsKHR  depthResolveMode;  
    VkResolveModeFlagBitsKHR  stencilResolveMode;  
    const VkAttachmentReference2KHR* pDepthStencilResolveAttachment;  
} VkSubpassDescriptionDepthStencilResolveKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `depthResolveMode` is a bitmask of `VkResolveModeFlagBitsKHR` describing the depth resolve mode.
- `stencilResolveMode` is a bitmask of `VkResolveModeFlagBitsKHR` describing the stencil resolve mode.
- `pDepthStencilResolveAttachment` is an optional `VkAttachmentReference` structure defining the depth/stencil resolve attachment for this subpass and its layout.

## Valid Usage

- If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `pDepthStencilAttachment` **must** not have the value `VK_ATTACHMENT_UNUSED`
- If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` **must** not both be `VK_RESOLVE_MODE_NONE_KHR`
- If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `pDepthStencilAttachment` **must** not have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `pDepthStencilResolveAttachment` **must** have a sample count of `VK_SAMPLE_COUNT_1_BIT`
- If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` then it **must** have a format whose features contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`
- If the `VkFormat` of `pDepthStencilResolveAttachment` has a depth component, then the `VkFormat` of `pDepthStencilAttachment` **must** have a depth component with the same number of bits and numerical type
- If the `VkFormat` of `pDepthStencilResolveAttachment` has a stencil component, then the `VkFormat` of `pDepthStencilAttachment` **must** have a stencil component with the same number of bits and numerical type
- The value of `depthResolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolvePropertiesKHR::supportedDepthResolveModes` or `VK_RESOLVE_MODE_NONE_KHR`
- The value of `stencilResolveMode` **must** be one of the bits set in `VkPhysicalDeviceDepthStencilResolvePropertiesKHR::supportedStencilResolveModes` or `VK_RESOLVE_MODE_NONE_KHR`
- If the `VkFormat` of `pDepthStencilResolveAttachment` has both depth and stencil components, `VkPhysicalDeviceDepthStencilResolvePropertiesKHR::independentResolve` is `VK_FALSE`, and `VkPhysicalDeviceDepthStencilResolvePropertiesKHR::independentResolveNone` is `VK_FALSE`, then the values of `depthResolveMode` and `stencilResolveMode` **must** be identical
- If the `VkFormat` of `pDepthStencilResolveAttachment` has both depth and stencil components, `VkPhysicalDeviceDepthStencilResolvePropertiesKHR::independentResolve` is `VK_FALSE`, and `VkPhysicalDeviceDepthStencilResolvePropertiesKHR::independentResolveNone` is `VK_TRUE`, then the values of `depthResolveMode` and `stencilResolveMode` **must** be identical or one of them **must** be `VK_RESOLVE_MODE_NONE_KHR`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_DEPTH_STENCIL_RESOLVE_KHR`
- `depthResolveMode` **must** be a valid `VkResolveModeFlagBitsKHR` value
- `stencilResolveMode` **must** be a valid `VkResolveModeFlagBitsKHR` value
- If `pDepthStencilResolveAttachment` is not `NULL`, `pDepthStencilResolveAttachment` **must** be a valid pointer to a valid `VkAttachmentReference2KHR` structure

Possible values of `VkSubpassDescriptionDepthStencilResolveKHR::depthResolveMode` and `stencilResolveMode`, specifying the depth and stencil resolve modes, are:

```
typedef enum VkResolveModeFlagBitsKHR {
    VK_RESOLVE_MODE_NONE_KHR = 0,
    VK_RESOLVE_MODE_SAMPLE_ZERO_BIT_KHR = 0x00000001,
    VK_RESOLVE_MODE_AVERAGE_BIT_KHR = 0x00000002,
    VK_RESOLVE_MODE_MIN_BIT_KHR = 0x00000004,
    VK_RESOLVE_MODE_MAX_BIT_KHR = 0x00000008,
    VK_RESOLVE_MODE_FLAG_BITS_MAX_ENUM_KHR = 0x7FFFFFFF
} VkResolveModeFlagBitsKHR;
```

- `VK_RESOLVE_MODE_NONE_KHR` indicates that no resolve operation is done.
- `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT_KHR` indicates that result of the resolve operation is equal to the value of sample 0.
- `VK_RESOLVE_MODE_AVERAGE_BIT_KHR` indicates that result of the resolve operation is the average of the sample values.
- `VK_RESOLVE_MODE_MIN_BIT_KHR` indicates that result of the resolve operation is the minimum of the sample values.
- `VK_RESOLVE_MODE_MAX_BIT_KHR` indicates that result of the resolve operation is the maximum of the sample values.

```
typedef VkFlags VkResolveModeFlagsKHR;
```

`VkResolveModeFlagsKHR` is a bitmask type for setting a mask of zero or more `VkResolveModeFlagBitsKHR`.

The `VkAttachmentReference2KHR` structure is defined as:

```
typedef struct VkAttachmentReference2KHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachment;
    VkImageLayout layout;
    VkImageAspectFlags aspectMask;
} VkAttachmentReference2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `attachment` is either an integer value identifying an attachment at the corresponding index in `VkRenderPassCreateInfo::pAttachments`, or `VK_ATTACHMENT_UNUSED` to signify that this attachment is not used.
- `layout` is a `VkImageLayout` value specifying the layout the attachment uses during the subpass.
- `aspectMask` is a mask of which aspect(s) **can** be accessed within the specified subpass as an input attachment.

Parameters defined by this structure with the same name as those in `VkAttachmentReference` have the identical effect to those parameters.

`aspectMask` has the same effect for the described attachment as `VkInputAttachmentAspectReference::aspectMask` has on each corresponding attachment. It is ignored when this structure is used to describe anything other than an input attachment reference.

If the `separateDepthStencilLayouts` feature is enabled, and `attachment` has a depth/stencil format, `layout` **can** be set to a layout that only specifies the layout of the depth aspect.

If `layout` only specifies the layout of the depth aspect of the attachment, the layout of the stencil aspect is specified by the `stencilLayout` member of an instance of `VkAttachmentReferenceStencilLayoutKHR` in the `pNext` chain. Otherwise, `layout` describes the layout for all relevant image aspects.

## Valid Usage

- If `attachment` is not `VK_ATTACHMENT_UNUSED`, `layout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`
- If the `separateDepthStencilLayouts` feature is not enabled, and `attachment` is not `VK_ATTACHMENT_UNUSED`, `layout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR`, or
- If `attachment` is not `VK_ATTACHMENT_UNUSED`, and `aspectMask` includes `VK_IMAGE_ASPECT_COLOR_BIT`, `layout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR`, or
- If `attachment` is not `VK_ATTACHMENT_UNUSED`, and `aspectMask` includes both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`, and `layout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR` or  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`, the `pNext` chain **must** include a valid instance of `VkAttachmentReferenceStencilLayoutKHR`
- If `attachment` is not `VK_ATTACHMENT_UNUSED`, and `aspectMask` includes only `VK_IMAGE_ASPECT_DEPTH_BIT` then `layout` **must** not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR` or
- If `attachment` is not `VK_ATTACHMENT_UNUSED`, and `aspectMask` includes only `VK_IMAGE_ASPECT_STENCIL_BIT` then `layout` **must** not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`,  
`VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR` or

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_2_KHR`
- `layout` **must** be a valid `VkImageLayout` value

The `VkAttachmentReferenceStencilLayoutKHR` structure is defined as:

```
typedef struct VkAttachmentReferenceStencilLayoutKHR {
    VkStructureType sType;
    void* pNext;
    VkImageLayout stencilLayout;
} VkAttachmentReferenceStencilLayoutKHR;
```

- `sType` is the type of this structure.

- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `stencilLayout` is a `VkImageLayout` value specifying the layout the stencil aspect of the attachment uses during the subpass.

## Valid Usage

- `stencilLayout` **must** not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`
- or

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_STENCIL_LAYOUT_KHR`
- `stencilLayout` **must** be a valid `VkImageLayout` value

The `VkSubpassDependency2KHR` structure is defined as:

```
typedef struct VkSubpassDependency2KHR {
    VkStructureType          sType;
    const void*              pNext;
    uint32_t                 srcSubpass;
    uint32_t                 dstSubpass;
    VkPipelineStageFlags     srcStageMask;
    VkPipelineStageFlags     dstStageMask;
    VkAccessFlags            srcAccessMask;
    VkAccessFlags            dstAccessMask;
    VkDependencyFlags        dependencyFlags;
    int32_t                  viewOffset;
} VkSubpassDependency2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `srcSubpass` is the subpass index of the first subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `dstSubpass` is the subpass index of the second subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the `source stage mask`.
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the `destination stage mask`
- `srcAccessMask` is a bitmask of `VkAccessFlagBits` specifying a `source access mask`.

- `dstAccessMask` is a bitmask of `VkAccessFlagBits` specifying a [destination access mask](#).
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits`.
- `viewOffset` controls which views in the source subpass the views in the destination subpass depend on.

Parameters defined by this structure with the same name as those in `VkSubpassDependency` have the identical effect to those parameters.

`viewOffset` has the same effect for the described subpass dependency as `VkRenderPassMultiviewCreateInfo::pViewOffsets` has on each corresponding subpass dependency.

## Valid Usage

- If the `geometry shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- If the `geometry shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
- If the `tessellation shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- If the `tessellation shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
- `srcSubpass` **must** be less than or equal to `dstSubpass`, unless one of them is `VK_SUBPASS_EXTERNAL`, to avoid cyclic dependencies and ensure a valid execution order
- `srcSubpass` and `dstSubpass` **must** not both be equal to `VK_SUBPASS_EXTERNAL`
- If `srcSubpass` is equal to `dstSubpass` and not all of the stages in `srcStageMask` and `dstStageMask` are `framebuffer-space stages`, the `logically latest` pipeline stage in `srcStageMask` **must** be `logically earlier` than or equal to the `logically earliest` pipeline stage in `dstStageMask`
- Any access flag included in `srcAccessMask` **must** be supported by one of the pipeline stages in `srcStageMask`, as specified in the [table of supported access types](#)
- Any access flag included in `dstAccessMask` **must** be supported by one of the pipeline stages in `dstStageMask`, as specified in the [table of supported access types](#)
- If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `srcSubpass` **must** not be equal to `VK_SUBPASS_EXTERNAL`
- If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `dstSubpass` **must** not be equal to `VK_SUBPASS_EXTERNAL`
- If `srcSubpass` equals `dstSubpass`, and `srcStageMask` and `dstStageMask` both include a `framebuffer-space stage`, then `dependencyFlags` **must** include `VK_DEPENDENCY_BY_REGION_BIT`
- If `viewOffset` is not equal to `0`, `srcSubpass` **must** not be equal to `dstSubpass`
- If `dependencyFlags` does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `viewOffset` **must** be `0`
- If `viewOffset` is not `0`, `srcSubpass` **must** not be equal to `dstSubpass`.
- If the `mesh shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`
- If the `task shaders` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`
- If the `mesh shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV`
- If the `task shaders` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_DEPENDENCY_2_KHR`
- `srcStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- `srcStageMask` **must** not be `0`
- `dstStageMask` **must** be a valid combination of `VkPipelineStageFlagBits` values
- `dstStageMask` **must** not be `0`
- `srcAccessMask` **must** be a valid combination of `VkAccessFlagBits` values
- `dstAccessMask` **must** be a valid combination of `VkAccessFlagBits` values
- `dependencyFlags` **must** be a valid combination of `VkDependencyFlagBits` values

To destroy a render pass, call:

```
void vkDestroyRenderPass(  
    VkDevice                                     device,  
    VkRenderPass                                renderPass,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the render pass.
- `renderPass` is the handle of the render pass to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- All submitted commands that refer to `renderPass` **must** have completed execution
- If `VkAllocationCallbacks` were provided when `renderPass` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `renderPass` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `renderPass` is not `VK_NULL_HANDLE`, `renderPass` **must** be a valid `VkRenderPass` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `renderPass` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `renderPass` must be externally synchronized

## 7.2. Render Pass Compatibility

Framebuffers and graphics pipelines are created based on a specific render pass object. They **must** only be used with that render pass object, or one compatible with it.

Two attachment references are compatible if they have matching format and sample count, or are both `VK_ATTACHMENT_UNUSED` or the pointer that would contain the reference is `NULL`.

Two arrays of attachment references are compatible if all corresponding pairs of attachments are compatible. If the arrays are of different lengths, attachment references not present in the smaller array are treated as `VK_ATTACHMENT_UNUSED`.

Two render passes are compatible if their corresponding color, input, resolve, and depth/stencil attachment references are compatible and if they are otherwise identical except for:

- Initial and final image layout in attachment descriptions
- Load and store operations in attachment descriptions
- Image layout in attachment references

As an additional special case, if two render passes have a single subpass, the resolve attachment reference and depth/stencil resolve mode compatibility requirements are ignored.

A framebuffer is compatible with a render pass if it was created using the same render pass or a compatible render pass.

## 7.3. Framebuffers

Render passes operate in conjunction with *framebuffers*. Framebuffers represent a collection of specific memory attachments that a render pass instance uses.

Framebuffers are represented by `VkFramebuffer` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFramebuffer)
```

To create a framebuffer, call:

```
VkResult vkCreateFramebuffer(  
    VkDevice                                     device,  
    const VkFramebufferCreateInfo*                pCreateInfo,  
    const VkAllocationCallbacks*                 pAllocator,  
    VkFramebuffer*                            pFramebuffer);
```

- `device` is the logical device that creates the framebuffer.
- `pCreateInfo` is a pointer to a `VkFramebufferCreateInfo` structure describing additional information about framebuffer creation.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pFramebuffer` is a pointer to a `VkFramebuffer` handle in which the resulting framebuffer object is returned.

## Valid Usage

- If `pCreateInfo->flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, and `attachmentCount` is not `0`, each element of `pCreateInfo->pAttachments` **must** have been created on `device`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkFramebufferCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pFramebuffer` **must** be a valid pointer to a `VkFramebuffer` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkFramebufferCreateInfo` structure is defined as:

```

typedef struct VkFramebufferCreateInfo {
    VkStructureType          sType;
    const void*             pNext;
    VkFramebufferCreateFlags flags;
    VkRenderPass              renderPass;
    uint32_t                  attachmentCount;
    const VkImageView*       pAttachments;
    uint32_t                  width;
    uint32_t                  height;
    uint32_t                  layers;
} VkFramebufferCreateInfo;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **flags** is a bitmask of [VkFramebufferCreateFlagBits](#)
- **renderPass** is a render pass defining what render passes the framebuffer will be compatible with. See [Render Pass Compatibility](#) for details.
- **attachmentCount** is the number of attachments.
- **pAttachments** is a pointer to an array of [VkImageView](#) handles, each of which will be used as the corresponding attachment in a render pass instance. If **flags** includes **VK\_FRAMEBUFFER\_CREATE\_IMAGELESS\_BIT\_KHR**, this parameter is ignored.
- **width**, **height** and **layers** define the dimensions of the framebuffer. If the render pass uses multiview, then **layers** **must** be one and each attachment requires a number of layers that is greater than the maximum bit index set in the view mask in the subpasses in which it is used.

Applications **must** ensure that all accesses to memory that backs image subresources used as attachments in a given renderpass instance either happen-before the [load operations](#) for those attachments, or happen-after the [store operations](#) for those attachments.

For depth/stencil attachments, each aspect **can** be used separately as attachments and non-attachments as long as the non-attachment accesses are also via an image subresource in either the **VK\_IMAGE\_LAYOUT\_DEPTH\_READ\_ONLY\_STENCIL\_ATTACHMENT\_OPTIMAL** layout or the **VK\_IMAGE\_LAYOUT\_DEPTH\_ATTACHMENT\_STENCIL\_READ\_ONLY\_OPTIMAL** layout, and the attachment resource uses whichever of those two layouts the image accesses do not. Use of non-attachment aspects in this case is only well defined if the attachment is used in the subpass where the non-attachment access is being made, or the layout of the image subresource is constant throughout the entire render pass instance, including the **initialLayout** and **finalLayout**.

#### Note

These restrictions mean that the render pass has full knowledge of all uses of all of the attachments, so that the implementation is able to make correct decisions about when and how to perform layout transitions, when to overlap execution of subpasses, etc.

It is legal for a subpass to use no color or depth/stencil attachments, and rather use shader side

effects such as image stores and atomics to produce an output. In this case, the subpass continues to use the `width`, `height`, and `layers` of the framebuffer to define the dimensions of the rendering area, and the `rasterizationSamples` from each pipeline's `VkPipelineMultisampleStateCreateInfo` to define the number of samples used in rasterization; however, if `VkPhysicalDeviceFeatures::variableMultisampleRate` is `VK_FALSE`, then all pipelines to be bound with a given zero-attachment subpass **must** have the same value for `VkPipelineMultisampleStateCreateInfo::rasterizationSamples`.

## Valid Usage

- `attachmentCount` **must** be equal to the attachment count specified in `renderPass`
- If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, and `attachmentCount` is not `0`, `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkImageView` handles
- If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of `pAttachments` that is used as a color attachment or resolve attachment by `renderPass` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`
- If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of `pAttachments` that is used as a depth/stencil attachment by `renderPass` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of `pAttachments` that is used as a depth/stencil resolve attachment by `renderPass` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of `pAttachments` that is used as an input attachment by `renderPass` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`
- Each element of `pAttachments` that is used as a fragment density map attachment by `renderPass` **must** not have been created with a `flags` value including `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.
- If `renderPass` has a fragment density map attachment and `non-subsample image feature` is not enabled, each element of `pAttachments` **must** have been created with a `flags` value including `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT` unless that element is the fragment density map attachment.
- If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of `pAttachments` **must** have been created with a `VkFormat` value that matches the `VkFormat` specified by the corresponding `VkAttachmentDescription` in `renderPass`
- If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of `pAttachments` **must** have been created with a `samples` value that matches the `samples` value specified by the corresponding `VkAttachmentDescription` in `renderPass`
- If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of `pAttachments` **must** have dimensions at least as large as the corresponding framebuffer dimension except for any element that is referenced by `fragmentDensityMapAttachment`
- If `renderPass` was specified with non-zero view masks, each element of `pAttachments` that is not referenced by `fragmentDensityMapAttachment` **must** have a `layerCount` greater than the index of the most significant bit set in any of those view masks
- If `renderPass` was specified with non-zero view masks, each element of `pAttachments` that is referenced by `fragmentDensityMapAttachment` **must** have a `layerCount` equal to `1` or greater than the index of the most significant bit set in any of those view masks
- If `renderPass` was not specified with non-zero view masks, each element of `pAttachments` that is referenced by `fragmentDensityMapAttachment` **must** have a `layerCount` equal to `1`

- If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, an element of `pAttachments` that is referenced by `fragmentDensityMapAttachment` **must** have a width at least as large as  $\lceil \frac{\text{width}}{\maxFragmentDensityTexelSize_{\text{width}}} \rceil$
- If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, an element of `pAttachments` that is referenced by `fragmentDensityMapAttachment` **must** have a height at least as large as  $\lceil \frac{\text{height}}{\maxFragmentDensityTexelSize_{\text{height}}} \rceil$
- If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of `pAttachments` **must** only specify a single mip level
- If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of `pAttachments` **must** have been created with the identity swizzle
- `width` **must** be greater than `0`.
- `width` **must** be less than or equal to `VkPhysicalDeviceLimits::maxFramebufferWidth`
- `height` **must** be greater than `0`.
- `height` **must** be less than or equal to `VkPhysicalDeviceLimits::maxFramebufferHeight`
- `layers` **must** be greater than `0`.
- `layers` **must** be less than or equal to `VkPhysicalDeviceLimits::maxFramebufferLayers`
- If `renderPass` was specified with non-zero view masks, `layers` **must** be `1`
- If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of `pAttachments` that is a 2D or 2D array image view taken from a 3D image **must** not be a depth/stencil format
- If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, and `attachmentCount` is not `0`, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkImageView` handles
- If the `imageless framebuffer` feature is not enabled, `flags` **must** not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`
- If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, the `pNext` chain **must** include an instance of `VkFramebufferAttachmentsCreateInfoKHR`
- If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, the `attachmentImageInfoCount` member of an instance of `VkFramebufferAttachmentsCreateInfoKHR` in the `pNext` chain **must** be equal to either zero or `attachmentCount`
- If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, the `width` member of any element of the `pAttachmentImageInfos` member of an instance of `VkFramebufferAttachmentsCreateInfoKHR` in the `pNext` chain **must** be greater than or equal to `width`, except for any element that is referenced by `VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment` in `renderPass`
- If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, the `height` member of any element of the `pAttachmentImageInfos` member of an instance of `VkFramebufferAttachmentsCreateInfoKHR` in the `pNext` chain **must** be greater than or equal to `height`, except for any element that is referenced by `VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment` in `renderPass`

- If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, the `width` member of any element of the `pAttachmentImageInfos` member of an instance of `VkFramebufferAttachmentsCreateInfoKHR` in the `pNext` chain that is referenced by `VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment` in `renderPass` **must** be greater than or equal to  $\lceil \frac{\text{width}}{\maxFragmentDensityTexelSize_{\text{width}}} \rceil$
- If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, the `height` member of any element of the `pAttachmentImageInfos` member of an instance of `VkFramebufferAttachmentsCreateInfoKHR` in the `pNext` chain that is referenced by `VkRenderPassFragmentDensityMapCreateInfoEXT::fragmentDensityMapAttachment` in `renderPass` **must** be greater than or equal to  $\lceil \frac{\text{height}}{\maxFragmentDensityTexelSize_{\text{height}}} \rceil$
- If multiview is enabled for `renderPass`, and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, the `layerCount` member of any element of the `pAttachmentImageInfos` member of an instance of `VkFramebufferAttachmentsCreateInfoKHR` in the `pNext` chain **must** be greater than the maximum bit index set in the view mask in the subpasses in which it is used in `renderPass`
- If multiview is not enabled for `renderPass`, and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, the `layerCount` member of any element of the `pAttachmentImageInfos` member of an instance of `VkFramebufferAttachmentsCreateInfoKHR` in the `pNext` chain **must** be greater than or equal to `layers`
- If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, the `usage` member of any element of the `pAttachmentImageInfos` member of an instance of `VkFramebufferAttachmentsCreateInfoKHR` in the `pNext` chain that refers to an attachment used as a color attachment or resolve attachment by `renderPass` **must** include `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`
- If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, the `usage` member of any element of the `pAttachmentImageInfos` member of an instance of `VkFramebufferAttachmentsCreateInfoKHR` in the `pNext` chain that refers to an attachment used as a depth/stencil attachment by `renderPass` **must** include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, the `usage` member of any element of the `pAttachmentImageInfos` member of an instance of `VkFramebufferAttachmentsCreateInfoKHR` in the `pNext` chain that refers to an attachment used as a depth/stencil resolve attachment by `renderPass` **must** include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, the `usage` member of any element of the `pAttachmentImageInfos` member of an instance of `VkFramebufferAttachmentsCreateInfoKHR` in the `pNext` chain that refers to an attachment used as an input attachment by `renderPass` **must** include `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`
- If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, at least one element of the `pViewFormats` member of any element of the `pAttachmentImageInfos` member of an instance of `VkFramebufferAttachmentsCreateInfoKHR` in the `pNext` chain **must** be equal to the corresponding value of `VkAttachmentDescription::format` used to create `renderPass`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_FRAMEBUFFER_CREATE_INFO`
- `pNext` **must** be `NULL` or a pointer to a valid instance of `VkFramebufferAttachmentsCreateInfoKHR`
- `flags` **must** be a valid combination of `VkFramebufferCreateFlagBits` values
- `renderPass` **must** be a valid `VkRenderPass` handle
- Both of `renderPass`, and the elements of `pAttachments` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

The `VkFramebufferAttachmentsCreateInfoKHR` structure is defined as:

```
typedef struct VkFramebufferAttachmentsCreateInfoKHR {  
    VkStructureType sType;  
    const void* pNext;  
    uint32_t attachmentImageInfoCount;  
    const VkFramebufferAttachmentImageInfoKHR* pAttachmentImageInfos;  
} VkFramebufferAttachmentsCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `attachmentImageInfoCount` is the number of attachments being described.
- `pAttachmentImageInfos` is a pointer to an array of `VkFramebufferAttachmentImageInfoKHR` instances, each of which describes a number of parameters of the corresponding attachment in a render pass instance.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENTS_CREATE_INFO_KHR`
- If `attachmentImageInfoCount` is not `0`, `pAttachmentImageInfos` **must** be a valid pointer to an array of `attachmentImageInfoCount` valid `VkFramebufferAttachmentImageInfoKHR` structures

The `VkFramebufferAttachmentImageInfoKHR` structure is defined as:

```

typedef struct VkFramebufferAttachmentImageInfoKHR {
    VkStructureType      sType;
    const void*        pNext;
    VkImageCreateFlags   flags;
    VkImageUsageFlags    usage;
    uint32_t             width;
    uint32_t             height;
    uint32_t             layerCount;
    uint32_t             viewFormatCount;
    const VkFormat*     pViewFormats;
} VkFramebufferAttachmentImageInfoKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **flags** is a bitmask of [VkImageCreateFlagBits](#), matching the value of [VkImageCreateInfo::flags](#) used to create an image that will be used with this framebuffer.
- **usage** is a bitmask of [VkImageUsageFlagBits](#), matching the value of [VkImageCreateInfo::usage](#) used to create an image used with this framebuffer.
- **width** is the width of the image view used for rendering.
- **height** is the height of the image view used for rendering.
- **viewFormatCount** is the number of entries in the **pViewFormats** array, matching the value of [VkImageFormatListCreateInfoKHR::viewFormatCount](#) used to create an image used with this framebuffer.
- **pViewFormats** is an array which lists of all formats which **can** be used when creating views of the image, matching the value of [VkImageFormatListCreateInfoKHR::pViewFormats](#) used to create an image used with this framebuffer.

Images that **can** be used with the framebuffer when beginning a render pass, as specified by [VkRenderPassAttachmentBeginInfoKHR](#), **must** be created with parameters that are identical to those specified here.

## Valid Usage (Implicit)

- **sType must** be [VK\\_STRUCTURE\\_TYPE\\_FRAMEBUFFER\\_ATTACHMENT\\_IMAGE\\_INFO\\_KHR](#)
- **pNext must** be **NULL**
- **flags must** be a valid combination of [VkImageCreateFlagBits](#) values
- **usage must** be a valid combination of [VkImageUsageFlagBits](#) values
- **usage must** not be **0**
- If **viewFormatCount** is not **0**, **pViewFormats must** be a valid pointer to an array of **viewFormatCount** valid [VkFormat](#) values

Bits which **can** be set in [VkFramebufferCreateInfo::flags](#) to specify options for framebuffers are:

```
typedef enum VkFramebufferCreateFlagBits {
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR = 0x00000001,
    VK_FRAMEBUFFER_CREATE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkFramebufferCreateFlagBits;
```

- `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR` specifies that image views are not specified, and only attachment compatibility information will be provided via an instance of `VkFramebufferAttachmentImageInfoKHR`.

```
typedef VkFlags VkFramebufferCreateFlags;
```

`VkFramebufferCreateFlags` is a bitmask type for setting a mask of zero or more `VkFramebufferCreateFlagBits`.

To destroy a framebuffer, call:

```
void vkDestroyFramebuffer(
    VkDevice                               device,
    VkFramebuffer                          framebuffer,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the framebuffer.
- `framebuffer` is the handle of the framebuffer to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- All submitted commands that refer to `framebuffer` **must** have completed execution
- If `VkAllocationCallbacks` were provided when `framebuffer` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `framebuffer` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `framebuffer` is not `VK_NULL_HANDLE`, `framebuffer` **must** be a valid `VkFramebuffer` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `framebuffer` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `framebuffer` must be externally synchronized

## 7.4. Render Pass Commands

An application records the commands for a render pass instance one subpass at a time, by beginning a render pass instance, iterating over the subpasses to record commands for that subpass, and then ending the render pass instance.

To begin a render pass instance, call:

```
void vkCmdBeginRenderPass(  
    VkCommandBuffer  
    const VkRenderPassBeginInfo*  
    VkSubpassContents  
        commandBuffer,  
        pRenderPassBegin,  
        contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a `VkRenderPassBeginInfo` structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- `contents` is a `VkSubpassContents` value specifying how the commands in the first subpass will be provided.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

## Valid Usage

- If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`
- If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`,  
`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`,  
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, or  
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`
- If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`
- If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_DST_BIT`
- If any of the `initialLayout` members of the `VkAttachmentDescription` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is not `VK_IMAGE_LAYOUT_UNDEFINED`, then each such `initialLayout` **must** be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin`
- The `srcStageMask` and `dstStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` **must** be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the

[VkCommandPoolCreateInfo](#) used to create the command pool which `commandBuffer` was allocated from

- For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments **must** have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid [VkCommandBuffer](#) handle
- `pRenderPassBegin` **must** be a valid pointer to a valid [VkRenderPassBeginInfo](#) structure
- `contents` **must** be a valid [VkSubpassContents](#) value
- `commandBuffer` **must** be in the [recording state](#)
- The [VkCommandPool](#) that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called outside of a render pass instance
- `commandBuffer` **must** be a primary [VkCommandBuffer](#)

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the [VkCommandPool](#) that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary	Outside	Graphics	Graphics

Alternatively to begin a render pass, call:

```
void vkCmdBeginRenderPass2KHR(  
    VkCommandBuffer  
    const VkRenderPassBeginInfo*  
    const VkSubpassBeginInfoKHR*  
                                commandBuffer,  
                                pRenderPassBegin,  
                                pSubpassBeginInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a [VkRenderPassBeginInfo](#) structure specifying the render pass

to begin an instance of, and the framebuffer the instance uses.

- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfoKHR` structure containing information about the subpass which is about to begin rendering.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

## Valid Usage

- Both the `framebuffer` and `renderPass` members of `pRenderPassBegin` **must** have been created on the same `VkDevice` that `commandBuffer` was allocated on
- If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`
- If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`,  
`VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`,  
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, or  
`VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`
- If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`
- If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` **must** have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_DST_BIT`
- If any of the `initialLayout` members of the `VkAttachmentDescription` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is not `VK_IMAGE_LAYOUT_UNDEFINED`, then each such `initialLayout` **must** be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin`
- The `srcStageMask` and `dstStageMask` members of any element of the `pDependencies` member

of `VkRenderPassCreateInfo` used to create `renderPass` **must** be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from

- For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments **must** have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `pRenderPassBegin` **must** be a valid pointer to a valid `VkRenderPassBeginInfo` structure
- `pSubpassBeginInfo` **must** be a valid pointer to a valid `VkSubpassBeginInfoKHR` structure
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called outside of a render pass instance
- `commandBuffer` **must** be a primary `VkCommandBuffer`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary	Outside	Graphics	Graphics

The `VkRenderPassBeginInfo` structure is defined as:

```

typedef struct VkRenderPassBeginInfo {
    VkStructureType      sType;
    const void*        pNext;
    VkRenderPass         renderPass;
    VkFramebuffer       framebuffer;
    VkRect2D             renderArea;
    uint32_t              clearValueCount;
    const VkClearValue* pClearValues;
} VkRenderPassBeginInfo;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **renderPass** is the render pass to begin an instance of.
- **framebuffer** is the framebuffer containing the attachments that are used with the render pass.
- **renderArea** is the render area that is affected by the render pass instance, and is described in more detail below.
- **clearValueCount** is the number of elements in **pClearValues**.
- **pClearValues** is a pointer to an array of **clearValueCount** **VkClearValue** structures that contains clear values for each attachment, if the attachment uses a **loadOp** value of **VK\_ATTACHMENT\_LOAD\_OP\_CLEAR** or if the attachment has a depth/stencil format and uses a **stencilLoadOp** value of **VK\_ATTACHMENT\_LOAD\_OP\_CLEAR**. The array is indexed by attachment number. Only elements corresponding to cleared attachments are used. Other elements of **pClearValues** are ignored.

**renderArea** is the render area that is affected by the render pass instance. The effects of attachment load, store and multisample resolve operations are restricted to the pixels whose x and y coordinates fall within the render area on all attachments. The render area extends to all layers of **framebuffer**. The application **must** ensure (using scissor if necessary) that all rendering is contained within the render area. The render area **must** be contained within the framebuffer dimensions.

When multiview is enabled, the resolve operation at the end of a subpass applies to all views in the view mask.

*Note*

There **may** be a performance cost for using a render area smaller than the framebuffer, unless it matches the render area granularity for the render pass.

## Valid Usage

- `clearValueCount` **must** be greater than the largest attachment index in `renderPass` that specifies a `loadOp` (or `stencilLoadOp`, if the attachment has a depth/stencil format) of `VK_ATTACHMENT_LOAD_OP_CLEAR`
- `renderPass` **must** be `compatible` with the `renderPass` member of the `VkFramebufferCreateInfo` structure specified when creating `framebuffer`.
- If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that did not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, and the `pNext` chain includes an instance of `VkRenderPassAttachmentBeginInfoKHR`, its `attachmentCount` **must** be zero
- If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, the `attachmentCount` of an instance of `VkRenderPassAttachmentBeginInfoKHR` included in the `pNext` chain **must** be equal to the value of `VkFramebufferAttachmentsCreateInfoKHR::attachmentImageInfoCount` used to create `framebuffer`
- If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of the `pAttachments` member of an instance of `VkRenderPassAttachmentBeginInfoKHR` included in the `pNext` chain **must** have been created on the same `VkDevice` as `framebuffer` and `renderPass`
- If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of the `pAttachments` member of an instance of `VkRenderPassAttachmentBeginInfoKHR` included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageCreateInfo::flags` equal to the `flags` member of the corresponding element of `VkFramebufferAttachmentsCreateInfoKHR::pAttachments` used to create `framebuffer`
- If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of the `pAttachments` member of an instance of `VkRenderPassAttachmentBeginInfoKHR` included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageCreateInfo::usage` equal to the `usage` member of the corresponding element of `VkFramebufferAttachmentsCreateInfoKHR::pAttachments` used to create `framebuffer`
- If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of the `pAttachments` member of an instance of `VkRenderPassAttachmentBeginInfoKHR` included in the `pNext` chain **must** be a `VkImageView` with a width equal to the `width` member of the corresponding element of `VkFramebufferAttachmentsCreateInfoKHR::pAttachments` used to create `framebuffer`
- If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of the `pAttachments` member of an instance of `VkRenderPassAttachmentBeginInfoKHR` included in the `pNext` chain **must** be a `VkImageView` with a height equal to the `height` member of the corresponding element of `VkFramebufferAttachmentsCreateInfoKHR::pAttachments` used to create `framebuffer`
- If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of the `pAttachments` member of an instance of `VkRenderPassAttachmentBeginInfoKHR` included in the `pNext` chain **must** be a

`VkImageView` of an image created with a value of `VkImageViewCreateInfo::subresourceRange.pName`:`layerCount` equal to the `layerCount` member of the corresponding element of `VkFramebufferAttachmentsCreateInfoKHR::pAttachments` used to create `framebuffer`

- If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of the `pAttachments` member of an instance of `VkRenderPassAttachmentBeginInfoKHR` included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageFormatListCreateInfoKHR::viewFormatCount` equal to the `viewFormatCount` member of the corresponding element of `VkFramebufferAttachmentsCreateInfoKHR::pAttachments` used to create `framebuffer`
- If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of the `pAttachments` member of an instance of `VkRenderPassAttachmentBeginInfoKHR` included in the `pNext` chain **must** be a `VkImageView` of an image created with a set of elements in `VkImageFormatListCreateInfoKHR::pViewFormats` equal to the set of elements in the `pViewFormats` member of the corresponding element of `VkFramebufferAttachmentsCreateInfoKHR::pAttachments` used to create `framebuffer`
- If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of the `pAttachments` member of an instance of `VkRenderPassAttachmentBeginInfoKHR` included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageViewCreateInfo::format` equal to the corresponding value of `VkAttachmentDescription::format` in `renderPass`
- If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR`, each element of the `pAttachments` member of an instance of `VkRenderPassAttachmentBeginInfoKHR` included in the `pNext` chain **must** be a `VkImageView` of an image created with a value of `VkImageCreateInfo::samples` equal to the corresponding value of `VkAttachmentDescription::samples` in `renderPass`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_BEGIN_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDeviceGroupRenderPassBeginInfo`, `VkRenderPassAttachmentBeginInfoKHR`, or `VkRenderPassSampleLocationsBeginInfoEXT`
- Each `sType` member in the `pNext` chain **must** be unique
- `renderPass` **must** be a valid `VkRenderPass` handle
- `framebuffer` **must** be a valid `VkFramebuffer` handle
- If `clearValueCount` is not `0`, `pClearValues` **must** be a valid pointer to an array of `clearValueCount` `VkClearValue` unions
- Both of `framebuffer`, and `renderPass` **must** have been created, allocated, or retrieved from the same `VkDevice`

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the image subresource, thus preserving the contents of such depth/stencil attachments across subpass boundaries requires the application to specify these sample locations whenever a layout transition of the attachment **may** occur. This information **can** be provided by chaining an instance of the `VkRenderPassSampleLocationsBeginInfoEXT` structure to the `pNext` chain of `VkRenderPassBeginInfo`.

The `VkRenderPassSampleLocationsBeginInfoEXT` structure is defined as:

```
typedef struct VkRenderPassSampleLocationsBeginInfoEXT {
    VkStructureType           sType;
    const void*               pNext;
    uint32_t                  attachmentInitialSampleLocationsCount;
    const VkAttachmentSampleLocationsEXT* pAttachmentInitialSampleLocations;
    uint32_t                  postSubpassSampleLocationsCount;
    const VkSubpassSampleLocationsEXT* pPostSubpassSampleLocations;
} VkRenderPassSampleLocationsBeginInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `attachmentInitialSampleLocationsCount` is the number of elements in the `pAttachmentInitialSampleLocations` array.
- `pAttachmentInitialSampleLocations` is a pointer to an array of `VkAttachmentSampleLocationsEXT` structures specifying the attachment indices and their corresponding sample location state. Each element of `pAttachmentInitialSampleLocations` **can** specify the sample location state to use in the automatic layout transition performed to transition a depth/stencil attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.
- `postSubpassSampleLocationsCount` is the number of elements in the `pPostSubpassSampleLocations` array.
- `pPostSubpassSampleLocations` is a pointer to an array of `postSubpassSampleLocationsCount` `VkSubpassSampleLocationsEXT` structures specifying the subpass indices and their corresponding sample location state. Each element of `pPostSubpassSampleLocations` **can** specify the sample location state to use in the automatic layout transition performed to transition the depth/stencil attachment used by the specified subpass to the image layout specified in a dependent subpass or to the final layout of the attachment in case the specified subpass is the last subpass using that attachment. In addition, if `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE`, each element of `pPostSubpassSampleLocations` **must** specify the sample location state that matches the sample locations used by all pipelines that will be bound to a command buffer during the specified subpass. If `variableSampleLocations` is `VK_TRUE`, the sample locations used for rasterization do not depend on `pPostSubpassSampleLocations`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_SAMPLE_LOCATIONS_BEGIN_INFO_EXT`
- If `attachmentInitialSampleLocationsCount` is not `0`, `pAttachmentInitialSampleLocations` **must** be a valid pointer to an array of `attachmentInitialSampleLocationsCount` valid `VkAttachmentSampleLocationsEXT` structures
- If `postSubpassSampleLocationsCount` is not `0`, `pPostSubpassSampleLocations` **must** be a valid pointer to an array of `postSubpassSampleLocationsCount` valid `VkSubpassSampleLocationsEXT` structures

The `VkAttachmentSampleLocationsEXT` structure is defined as:

```
typedef struct VkAttachmentSampleLocationsEXT {  
    uint32_t attachmentIndex;  
    VkSampleLocationsInfoEXT sampleLocationsInfo;  
} VkAttachmentSampleLocationsEXT;
```

- `attachmentIndex` is the index of the attachment for which the sample locations state is provided.
- `sampleLocationsInfo` is the sample locations state to use for the layout transition of the given attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.

If the image referenced by the framebuffer attachment at index `attachmentIndex` was not created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` then the values specified in `sampleLocationsInfo` are ignored.

## Valid Usage

- `attachmentIndex` **must** be less than the `attachmentCount` specified in `VkRenderPassCreateInfo` the render pass specified by `VkRenderPassBeginInfo::renderPass` was created with

## Valid Usage (Implicit)

- `sampleLocationsInfo` **must** be a valid `VkSampleLocationsInfoEXT` structure

The `VkSubpassSampleLocationsEXT` structure is defined as:

```
typedef struct VkSubpassSampleLocationsEXT {  
    uint32_t subpassIndex;  
    VkSampleLocationsInfoEXT sampleLocationsInfo;  
} VkSubpassSampleLocationsEXT;
```

- `subpassIndex` is the index of the subpass for which the sample locations state is provided.
- `sampleLocationsInfo` is the sample locations state to use for the layout transition of the depth/stencil attachment away from the image layout the attachment is used with in the subpass specified in `subpassIndex`.

If the image referenced by the depth/stencil attachment used in the subpass identified by `subpassIndex` was not created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` or if the subpass does not use a depth/stencil attachment, and `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_TRUE` then the values specified in `sampleLocationsInfo` are ignored.

## Valid Usage

- `subpassIndex` **must** be less than the `subpassCount` specified in `VkRenderPassCreateInfo` the render pass specified by `VkRenderPassBeginInfo::renderPass` was created with

## Valid Usage (Implicit)

- `sampleLocationsInfo` **must** be a valid `VkSampleLocationsInfoEXT` structure

The `VkSubpassBeginInfoKHR` structure is defined as:

```
typedef struct VkSubpassBeginInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSubpassContents  contents;
} VkSubpassBeginInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `contents` is a `VkSubpassContents` value specifying how the commands in the next subpass will be provided.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_BEGIN_INFO_KHR`
- `pNext` **must** be `NULL`
- `contents` **must** be a valid `VkSubpassContents` value

Possible values of `vkCmdBeginRenderPass::contents`, specifying how the commands in the first subpass will be provided, are:

```

typedef enum VkSubpassContents {
    VK_SUBPASS_CONTENTS_INLINE = 0,
    VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS = 1,
    VK_SUBPASS_CONTENTS_MAX_ENUM = 0x7FFFFFFF
} VkSubpassContents;

```

- **VK\_SUBPASS\_CONTENTS\_INLINE** specifies that the contents of the subpass will be recorded inline in the primary command buffer, and secondary command buffers **must** not be executed within the subpass.
- **VK\_SUBPASS\_CONTENTS\_SECONDARY\_COMMAND\_BUFFERS** specifies that the contents are recorded in secondary command buffers that will be called from the primary command buffer, and `vkCmdExecuteCommands` is the only valid command on the command buffer until `vkCmdNextSubpass` or `vkCmdEndRenderPass`.

If the `pNext` chain of `VkRenderPassBeginInfo` includes a `VkDeviceGroupRenderPassBeginInfo` structure, then that structure includes a device mask and set of render areas for the render pass instance.

The `VkDeviceGroupRenderPassBeginInfo` structure is defined as:

```

typedef struct VkDeviceGroupRenderPassBeginInfo {
    VkStructureType      sType;
    const void*        pNext;
    uint32_t             deviceMask;
    uint32_t             deviceRenderAreaCount;
    const VkRect2D*    pDeviceRenderAreas;
} VkDeviceGroupRenderPassBeginInfo;

```

or the equivalent

```
typedef VkDeviceGroupRenderPassBeginInfo VkDeviceGroupRenderPassBeginInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `deviceMask` is the device mask for the render pass instance.
- `deviceRenderAreaCount` is the number of elements in the `pDeviceRenderAreas` array.
- `pDeviceRenderAreas` is a pointer to an array of `VkRect2D` structures defining the render area for each physical device.

The `deviceMask` serves several purposes. It is an upper bound on the set of physical devices that **can** be used during the render pass instance, and the initial device mask when the render pass instance begins. In addition, commands transitioning to the next subpass in the render pass instance and commands ending the render pass instance, and, accordingly render pass attachment load, store, and resolve operations and subpass dependencies corresponding to the render pass instance, are executed on the physical devices included in the device mask provided here.

If `deviceRenderAreaCount` is not zero, then the elements of `pDeviceRenderAreas` override the value of `VkRenderPassBeginInfo::renderArea`, and provide a render area specific to each physical device. These render areas serve the same purpose as `VkRenderPassBeginInfo::renderArea`, including controlling the region of attachments that are cleared by `VK_ATTACHMENT_LOAD_OP_CLEAR` and that are resolved into resolve attachments.

If this structure is not present, the render pass instance's device mask is the value of `VkDeviceGroupCommandBufferBeginInfo::deviceMask`. If this structure is not present or if `deviceRenderAreaCount` is zero, `VkRenderPassBeginInfo::renderArea` is used for all physical devices.

## Valid Usage

- `deviceMask` **must** be a valid device mask value
- `deviceMask` **must** not be zero
- `deviceMask` **must** be a subset of the command buffer's initial device mask
- `deviceRenderAreaCount` **must** either be zero or equal to the number of physical devices in the logical device.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_RENDER_PASS_BEGIN_INFO`
- If `deviceRenderAreaCount` is not `0`, `pDeviceRenderAreas` **must** be a valid pointer to an array of `deviceRenderAreaCount` `VkRect2D` structures

The `VkRenderPassAttachmentBeginInfoKHR` structure is defined as:

```
typedef struct VkRenderPassAttachmentBeginInfoKHR {
    VkStructureType      sType;
    const void*          pNext;
    uint32_t             attachmentCount;
    const VkImageView*   pAttachments;
} VkRenderPassAttachmentBeginInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `attachmentCount` is the number of attachments.
- `pAttachments` is a pointer to an array of `VkImageView` handles, each of which will be used as the corresponding attachment in the render pass instance.

## Valid Usage

- Each element of `pAttachments` **must** only specify a single mip level
- Each element of `pAttachments` **must** have been created with the identity swizzle

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_RENDER_PASS_ATTACHMENT_BEGIN_INFO_KHR`
- If `attachmentCount` is not `0`, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkImageView` handles

To query the render area granularity, call:

```
void vkGetRenderAreaGranularity(  
    VkDevice                                     device,  
    VkRenderPass                                renderPass,  
    VkExtent2D*                                  pGranularity);
```

- `device` is the logical device that owns the render pass.
- `renderPass` is a handle to a render pass.
- `pGranularity` is a pointer to a `VkExtent2D` structure in which the granularity is returned.

The conditions leading to an optimal `renderArea` are:

- the `offset.x` member in `renderArea` is a multiple of the `width` member of the returned `VkExtent2D` (the horizontal granularity).
- the `offset.y` member in `renderArea` is a multiple of the `height` of the returned `VkExtent2D` (the vertical granularity).
- either the `offset.width` member in `renderArea` is a multiple of the horizontal granularity or `offset.x+width` is equal to the `width` of the `framebuffer` in the `VkRenderPassBeginInfo`.
- either the `offset.height` member in `renderArea` is a multiple of the vertical granularity or `offset.y+height` is equal to the `height` of the `framebuffer` in the `VkRenderPassBeginInfo`.

Subpass dependencies are not affected by the render area, and apply to the entire image subresources attached to the framebuffer as specified in the description of [automatic layout transitions](#). Similarly, pipeline barriers are valid even if their effect extends outside the render area.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `renderPass` **must** be a valid `VkRenderPass` handle
- `pGranularity` **must** be a valid pointer to a `VkExtent2D` structure
- `renderPass` **must** have been created, allocated, or retrieved from `device`

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```
void vkCmdNextSubpass(  
    VkCommandBuffer  
    commandBuffer,  
    VkSubpassContents  
    contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `contents` specifies how the commands in the next subpass will be provided, in the same fashion as the corresponding parameter of `vkCmdBeginRenderPass`.

The subpass index for a render pass begins at zero when `vkCmdBeginRenderPass` is recorded, and increments each time `vkCmdNextSubpass` is recorded.

Moving to the next subpass automatically performs any multisample resolve operations in the subpass being ended. End-of-subpass multisample resolves are treated as color attachment writes for the purposes of synchronization. This applies to resolve operations for both color and depth/stencil attachments. That is, they are considered to execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage and their writes are synchronized with `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`. Synchronization between rendering within a subpass and any resolve operations at the end of the subpass occurs automatically, without need for explicit dependencies or pipeline barriers. However, if the resolve attachment is also used in a different subpass, an explicit dependency is needed.

After transitioning to the next subpass, the application **can** record the commands for that subpass.

## Valid Usage

- The current subpass index **must** be less than the number of subpasses in the render pass minus one
- This command **must** not be recorded when transform feedback is active

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `contents` **must** be a valid `VkSubpassContents` value
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called inside of a render pass instance
- `commandBuffer` **must** be a primary `VkCommandBuffer`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary	Inside	Graphics	Graphics

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```
void vkCmdNextSubpass2KHR(  
    VkCommandBuffer  
    const VkSubpassBeginInfoKHR*  
    const VkSubpassEndInfoKHR*  
                                commandBuffer,  
                                pSubpassBeginInfo,  
                                pSubpassEndInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfoKHR` structure containing information about the subpass which is about to begin rendering.
- `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfoKHR` structure containing information about how the previous subpass will be ended.

`vkCmdNextSubpass2KHR` is semantically identical to `vkCmdNextSubpass`, except that it is extensible, and that `contents` is provided as part of an extensible structure instead of as a flat parameter.

## Valid Usage

- The current subpass index **must** be less than the number of subpasses in the render pass minus one
- This command **must** not be recorded when transform feedback is active

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `pSubpassBeginInfo` **must** be a valid pointer to a valid `VkSubpassBeginInfoKHR` structure
- `pSubpassEndInfo` **must** be a valid pointer to a valid `VkSubpassEndInfoKHR` structure
- `commandBuffer` **must** be in the `recording state`
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called inside of a render pass instance
- `commandBuffer` **must** be a primary `VkCommandBuffer`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary	Inside	Graphics	Graphics

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```
void vkCmdEndRenderPass(  
    VkCommandBuffer  
        commandBuffer);
```

- `commandBuffer` is the command buffer in which to end the current render pass instance.

Ending a render pass instance performs any multisample resolve operations on the final subpass.

## Valid Usage

- The current subpass index **must** be equal to the number of subpasses in the render pass minus one
- This command **must** not be recorded when transform feedback is active

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `commandBuffer` **must** be in the `recording state`
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called inside of a render pass instance
- `commandBuffer` **must** be a primary `VkCommandBuffer`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary	Inside	Graphics	Graphics

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```
void vkCmdEndRenderPass2KHR(  
    VkCommandBuffer  
    const VkSubpassEndInfoKHR*  
                                commandBuffer,  
                                pSubpassEndInfo);
```

- `commandBuffer` is the command buffer in which to end the current render pass instance.
- `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfoKHR` structure containing information about how the previous subpass will be ended.

`vkCmdEndRenderPass2KHR` is semantically identical to `vkCmdEndRenderPass`, except that it is extensible.

## Valid Usage

- The current subpass index **must** be equal to the number of subpasses in the render pass minus one
- This command **must** not be recorded when transform feedback is active

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `pSubpassEndInfo` **must** be a valid pointer to a valid `VkSubpassEndInfoKHR` structure
- `commandBuffer` **must** be in the `recording state`
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called inside of a render pass instance
- `commandBuffer` **must** be a primary `VkCommandBuffer`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary	Inside	Graphics	Graphics

The `VkSubpassEndInfoKHR` structure is defined as:

```
typedef struct VkSubpassEndInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
} VkSubpassEndInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_END_INFO_KHR`
- `pNext` **must** be `NULL`

# Chapter 8. Shaders

A shader specifies programmable operations that execute for each vertex, control point, tessellated vertex, primitive, fragment, or workgroup in the corresponding stage(s) of the graphics and compute pipelines.

Graphics pipelines include vertex shader execution as a result of [primitive assembly](#), followed, if enabled, by tessellation control and evaluation shaders operating on [patches](#), geometry shaders, if enabled, operating on primitives, and fragment shaders, if present, operating on fragments generated by [Rasterization](#). In this specification, vertex, tessellation control, tessellation evaluation and geometry shaders are collectively referred to as vertex processing stages and occur in the logical pipeline before rasterization. The fragment shader occurs logically after rasterization.

Only the compute shader stage is included in a compute pipeline. Compute shaders operate on compute invocations in a workgroup.

Shaders **can** read from input variables, and read from and write to output variables. Input and output variables **can** be used to transfer data between shader stages, or to allow the shader to interact with values that exist in the execution environment. Similarly, the execution environment provides constants that describe capabilities.

Shader variables are associated with execution environment-provided inputs and outputs using *built-in* decorations in the shader. The available decorations for each stage are documented in the following subsections.

## 8.1. Shader Modules

*Shader modules* contain *shader code* and one or more entry points. Shaders are selected from a shader module by specifying an entry point as part of [pipeline](#) creation. The stages of a pipeline **can** use shaders that come from different modules. The shader code defining a shader module **must** be in the SPIR-V format, as described by the [Vulkan Environment for SPIR-V](#) appendix.

Shader modules are represented by [VkShaderModule](#) handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderModule)
```

To create a shader module, call:

```
VkResult vkCreateShaderModule(  
    VkDevice                                     device,  
    const VkShaderModuleCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkShaderModule* pShaderModule);
```

- **device** is the logical device that creates the shader module.
- **pCreateInfo** is a pointer to a [VkShaderModuleCreateInfo](#) structure.

- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pShaderModule` is a pointer to a `VkShaderModule` handle in which the resulting shader module object is returned.

Once a shader module has been created, any entry points it contains **can** be used in pipeline shader stages as described in [Compute Pipelines](#) and [Graphics Pipelines](#).

If the shader stage fails to compile `VK_ERROR_INVALID_SHADER_NV` will be generated and the compile log will be reported back to the application by `VK_EXT_debug_report` if enabled.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkShaderModuleCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pShaderModule` **must** be a valid pointer to a `VkShaderModule` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_SHADER_NV`

The `VkShaderModuleCreateInfo` structure is defined as:

```
typedef struct VkShaderModuleCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkShaderModuleCreateFlags flags;
    size_t                    codeSize;
    const uint32_t*           pCode;
} VkShaderModuleCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is reserved for future use.
- `codeSize` is the size, in bytes, of the code pointed to by `pCode`.
- `pCode` is a pointer to code that is used to create the shader module. The type and format of the

code is determined from the content of the memory addressed by `pCode`.

## Valid Usage

- `codeSize` **must** be greater than 0
- If `pCode` is a pointer to SPIR-V code, `codeSize` **must** be a multiple of 4
- `pCode` **must** point to either valid SPIR-V code, formatted and packed as described by the [Khronos SPIR-V Specification](#) or valid GLSL code which **must** be written to the [GL\\_KHR\\_vulkan\\_gsls](#) extension specification
- If `pCode` is a pointer to SPIR-V code, that code **must** adhere to the validation rules described by the [Validation Rules within a Module](#) section of the [SPIR-V Environment](#) appendix
- If `pCode` is a pointer to GLSL code, it **must** be valid GLSL code written to the [GL\\_KHR\\_vulkan\\_gsls](#) GLSL extension specification
- `pCode` **must** declare the `Shader` capability for SPIR-V code
- `pCode` **must** not declare any capability that is not supported by the API, as described by the [Capabilities](#) section of the [SPIR-V Environment](#) appendix
- If `pCode` declares any of the capabilities listed as **optional** in the [SPIR-V Environment](#) appendix, the corresponding feature(s) **must** be enabled.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO`
- `pNext` **must** be `NULL` or a pointer to a valid instance of [VkShaderModuleValidationCacheCreateInfoEXT](#)
- `flags` **must** be `0`
- `pCode` **must** be a valid pointer to an array of  $\frac{\text{codeSize}}{4}$  `uint32_t` values

```
typedef VkFlags VkShaderModuleCreateFlags;
```

`VkShaderModuleCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To use a `VkValidationCacheEXT` to cache shader validation results, add a `VkShaderModuleValidationCacheCreateInfoEXT` to the `pNext` chain of the `VkShaderModuleCreateInfo` structure, specifying the cache object to use.

The `VkShaderModuleValidationCacheCreateInfoEXT` struct is defined as:

```
typedef struct VkShaderModuleValidationCacheCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkValidationCacheEXT validationCache;
} VkShaderModuleValidationCacheCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `validationCache` is the validation cache object from which the results of prior validation attempts will be written, and to which new validation results for this `VkShaderModule` will be written (if not already present).

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_SHADER_MODULE_VALIDATION_CACHE_CREATE_INFO_EXT`
- `validationCache` **must** be a valid `VkValidationCacheEXT` handle

To destroy a shader module, call:

```
void vkDestroyShaderModule(
    VkDevice device,
    VkShaderModule shaderModule,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the shader module.
- `shaderModule` is the handle of the shader module to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

A shader module **can** be destroyed while pipelines created using its shaders are still in use.

## Valid Usage

- If `VkAllocationCallbacks` were provided when `shaderModule` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `shaderModule` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `shaderModule` is not `VK_NULL_HANDLE`, `shaderModule` **must** be a valid `VkShaderModule` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `shaderModule` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `shaderModule` **must** be externally synchronized

## 8.2. Shader Execution

At each stage of the pipeline, multiple invocations of a shader **may** execute simultaneously. Further, invocations of a single shader produced as the result of different commands **may** execute simultaneously. The relative execution order of invocations of the same shader type is undefined. Shader invocations **may** complete in a different order than that in which the primitives they originated from were drawn or dispatched by the application. However, fragment shader outputs are written to attachments in [rasterization order](#).

The relative execution order of invocations of different shader types is largely undefined. However, when invoking a shader whose inputs are generated from a previous pipeline stage, the shader invocations from the previous stage are guaranteed to have executed far enough to generate input values for all required inputs.

## 8.3. Shader Memory Access Ordering

The order in which image or buffer memory is read or written by shaders is largely undefined. For some shader types (vertex, tessellation evaluation, and in some cases, fragment), even the number of shader invocations that **may** perform loads and stores is undefined.

In particular, the following rules apply:

- [Vertex](#) and [tessellation evaluation](#) shaders will be invoked at least once for each unique vertex, as defined in those sections.
- [Fragment](#) shaders will be invoked zero or more times, as defined in that section.
- The relative execution order of invocations of the same shader type is undefined. A store issued by a shader when working on primitive B might complete prior to a store for primitive A, even if primitive A is specified prior to primitive B. This applies even to fragment shaders; while fragment shader outputs are always written to the framebuffer in [rasterization order](#), stores executed by fragment shader invocations are not.

- The relative execution order of invocations of different shader types is largely undefined.

*Note*

The above limitations on shader invocation order make some forms of synchronization between shader invocations within a single set of primitives unimplementable. For example, having one invocation poll memory written by another invocation assumes that the other invocation has been launched and will complete its writes in finite time.

The [Memory Model](#) appendix defines the terminology and rules for how to correctly communicate between shader invocations, such as when a write is [Visible-To](#) a read, and what constitutes a [Data Race](#).

Applications **must** not cause a data race.

## 8.4. Shader Inputs and Outputs

Data is passed into and out of shaders using variables with input or output storage class, respectively. User-defined inputs and outputs are connected between stages by matching their [Location](#) decorations. Additionally, data **can** be provided by or communicated to special functions provided by the execution environment using [BuiltIn](#) decorations.

In many cases, the same [BuiltIn](#) decoration **can** be used in multiple shader stages with similar meaning. The specific behavior of variables decorated as [BuiltIn](#) is documented in the following sections.

## 8.5. Task Shaders

Task shaders operate in conjunction with the mesh shaders to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline. Its primary purpose is to create a variable amount of subsequent mesh shader invocations.

Task shaders are invoked via the execution of the [programmable mesh shading](#) pipeline.

The task shader has no fixed-function inputs other than variables identifying the specific workgroup and invocation. The only fixed output of the task shader is a task count, identifying the number of mesh shader workgroups to create. The task shader can write additional outputs to task memory, which can be read by all of the mesh shader workgroups it created.

### 8.5.1. Task Shader Execution

Task workloads are formed from groups of work items called workgroups and processed by the task shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Task shaders execute in *global workgroups* which are divided into a number of *local workgroups* with a size that **can** be set by assigning a value to the [LocalSize](#) execution mode or via an object decorated by the [WorkgroupSize](#) decoration. An invocation within a local workgroup **can** share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members

of the local workgroup.

## 8.6. Mesh Shaders

Mesh shaders operate in workgroups to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline. Each workgroup emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

Mesh shaders are invoked via the execution of the [programmable mesh shading](#) pipeline.

The only inputs available to the mesh shader are variables identifying the specific workgroup and invocation and, if applicable, any outputs written to task memory by the task shader that spawned the mesh shader's workgroup. The mesh shader can operate without a task shader as well.

The invocations of the mesh shader workgroup write an output mesh, comprising a set of primitives with per-primitive attributes, a set of vertices with per-vertex attributes, and an array of indices identifying the mesh vertices that belong to each primitive. The primitives of this mesh are then processed by subsequent graphics pipeline stages, where the outputs of the mesh shader form an interface with the fragment shader.

### 8.6.1. Mesh Shader Execution

Mesh workloads are formed from groups of work items called workgroups and processed by the mesh shader in the current graphics pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Mesh shaders execute in *global workgroups* which are divided into a number of *local workgroups* with a size that **can** be set by assigning a value to the [LocalSize](#) execution mode or via an object decorated by the [WorkgroupSize](#) decoration. An invocation within a local workgroup **can** share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

The *global workgroups* may be generated explicitly via the API, or implicitly through the task shader's work creation mechanism.

## 8.7. Vertex Shaders

Each vertex shader invocation operates on one vertex and its associated [vertex attribute](#) data, and outputs one vertex and associated data. Graphics pipelines using primitive shading **must** include a vertex shader, and the vertex shader stage is always the first shader stage in the graphics pipeline.

### 8.7.1. Vertex Shader Execution

A vertex shader **must** be executed at least once for each vertex specified by a draw command. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view. During execution, the shader is presented with the index of the vertex and instance for which it has been invoked. Input variables declared in the vertex shader are filled by the implementation with the values of vertex attributes associated with the invocation being executed.

If the same vertex is specified multiple times in a draw command (e.g. by including the same index value multiple times in an index buffer) the implementation **may** reuse the results of vertex shading if it can statically determine that the vertex shader invocations will produce identical results.

*Note*

It is implementation-dependent when and if results of vertex shading are reused, and thus how many times the vertex shader will be executed. This is true also if the vertex shader contains stores or atomic operations (see [vertexPipelineStoresAndAtomics](#)).

## 8.8. Tessellation Control Shaders

The tessellation control shader is used to read an input patch provided by the application and to produce an output patch. Each tessellation control shader invocation operates on an input patch (after all control points in the patch are processed by a vertex shader) and its associated data, and outputs a single control point of the output patch and its associated data, and **can** also output additional per-patch data. The input patch is sized according to the [patchControlPoints](#) member of [VkPipelineTessellationStateCreateInfo](#), as part of input assembly. The size of the output patch is controlled by the [OpExecutionMode OutputVertices](#) specified in the tessellation control or tessellation evaluation shaders, which **must** be specified in at least one of the shaders. The size of the input and output patches **must** each be greater than zero and less than or equal to [VkPhysicalDeviceLimits ::maxTessellationPatchSize](#).

### 8.8.1. Tessellation Control Shader Execution

A tessellation control shader is invoked at least once for each *output* vertex in a patch. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

Inputs to the tessellation control shader are generated by the vertex shader. Each invocation of the tessellation control shader **can** read the attributes of any incoming vertices and their associated data. The invocations corresponding to a given patch execute logically in parallel, with undefined relative execution order. However, the [OpControlBarrier](#) instruction **can** be used to provide limited control of the execution order by synchronizing invocations within a patch, effectively dividing tessellation control shader execution into a set of phases. Tessellation control shaders will read undefined values if one invocation reads a per-vertex or per-patch attribute written by another invocation at any point during the same phase, or if two invocations attempt to write different values to the same per-patch output in a single phase.

## 8.9. Tessellation Evaluation Shaders

The Tessellation Evaluation Shader operates on an input patch of control points and their associated data, and a single input barycentric coordinate indicating the invocation's relative position within the subdivided patch, and outputs a single vertex and its associated data.

### 8.9.1. Tessellation Evaluation Shader Execution

A tessellation evaluation shader is invoked at least once for each unique vertex generated by the tessellator. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

## 8.10. Geometry Shaders

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

### 8.10.1. Geometry Shader Execution

A geometry shader is invoked at least once for each primitive produced by the tessellation stages, or at least once for each primitive generated by [primitive assembly](#) when tessellation is not in use. A shader can request that the geometry shader runs multiple [instances](#). A geometry shader is invoked at least once for each instance. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

## 8.11. Fragment Shaders

Fragment shaders are invoked as the result of rasterization in a graphics pipeline. Each fragment shader invocation operates on a single fragment and its associated data. With few exceptions, fragment shaders do not have access to any data associated with other fragments and are considered to execute in isolation of fragment shader invocations associated with other fragments.

### 8.11.1. Fragment Shader Execution

For each fragment generated by rasterization, a fragment shader **may** be invoked. A fragment shader **must** not be invoked if the [Early Per-Fragment Tests](#) cause it to have no coverage. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

Furthermore, if it is determined that a fragment generated as the result of rasterizing a first primitive will have its outputs entirely overwritten by a fragment generated as the result of rasterizing a second primitive in the same subpass, and the fragment shader used for the fragment has no other side effects, then the fragment shader **may** not be executed for the fragment from the first primitive.

Relative ordering of execution of different fragment shader invocations is not defined.

For each fragment generated by a primitive, the number of times the fragment shader is invoked is implementation-dependent, but **must** obey the following constraints:

- Each covered sample is included in a single fragment shader invocation.
- When sample shading is not enabled, there is at least one fragment shader invocation.
- When sample shading is enabled, the minimum number of fragment shader invocations is as

defined in [Shading Rate Image](#) and [Sample Shading](#).

When there is more than one fragment shader invocation per fragment, the association of samples to invocations is implementation-dependent.

In addition to the conditions outlined above for the invocation of a fragment shader, a fragment shader invocation **may** be produced as a *helper invocation*. A helper invocation is a fragment shader invocation that is created solely for the purposes of evaluating derivatives for use in non-helper fragment shader invocations. Stores and atomics performed by helper invocations **must** not have any effect on memory, and values returned by atomic instructions in helper invocations are undefined.

If the render pass has a fragment density map attachment, more than one fragment shader invocation **may** be invoked for each covered sample. Stores and atomics performed by these additional invocations have the normal effect. Such additional invocations are only produced if `VkPhysicalDeviceFragmentDensityMapPropertiesEXT::fragmentDensityInvocations` is `VK_TRUE`.

*Note*

Implementations **may** generate these additional fragment shader invocations in order to make transitions between fragment areas with different fragment densities more smooth.

### 8.11.2. Early Fragment Tests

An explicit control is provided to allow fragment shaders to enable early fragment tests. If the fragment shader specifies the `EarlyFragmentTests OpExecutionMode`, the per-fragment tests described in [Early Fragment Test Mode](#) are performed prior to fragment shader execution. Otherwise, they are performed after fragment shader execution.

If the fragment shader additionally specifies the `PostDepthCoverage OpExecutionMode`, the value of a variable decorated with the `SampleMask` built-in reflects the coverage after the early fragment tests. Otherwise, it reflects the coverage before the early fragment tests.

### 8.11.3. Fragment Shader Interlock

In normal operation, it is possible for more than one fragment shader invocation to be executed simultaneously for the same pixel if there are overlapping primitives. If the `fragmentShaderSampleInterlock`, `fragmentShaderPixelInterlock`, or `fragmentShaderShadingRateInterlock` features are enabled, it is possible to define a critical section within the fragment shader that is guaranteed to not run simultaneously with another fragment shader invocation for the same sample(s) or pixel(s). It is also possible to control the relative ordering of execution of these critical sections across different fragment shader invocations.

If the `FragmentShaderSampleInterlockEXT`, `FragmentShaderPixelInterlockEXT`, or `FragmentShaderShadingRateInterlockEXT` capabilities are declared in the fragment shader, the `OpBeginInvocationInterlockEXT` and `OpEndInvocationInterlockEXT` instructions **must** be used to delimit a critical section of fragment shader code.

To ensure each invocation of the critical section is executed in [primitive order](#), declare one of the

`PixelInterlockOrderedEXT`, `SampleInterlockOrderedEXT`, or `ShadingRateInterlockOrderedEXT` execution modes. If the order of execution of each invocation of the critical section does not matter, declare one of the `PixelInterlockUnorderedEXT`, `SampleInterlockUnorderedEXT`, or `ShadingRateInterlockUnorderedEXT` execution modes.

The `PixelInterlockOrderedEXT` and `PixelInterlockUnorderedEXT` execution modes provide mutual exclusion in the critical section for any pair of fragments corresponding to the same pixel, or pixels if the fragment covers more than one pixel. With sample shading enabled, these execution modes are treated like `SampleInterlockOrderedEXT` or `SampleInterlockUnorderedEXT` respectively.

The `SampleInterlockOrderedEXT` and `SampleInterlockUnorderedEXT` execution modes only provide mutual exclusion for pairs of fragments that both cover at least one common sample in the same pixel; these are recommended for performance if shaders use per-sample data structures. If these execution modes are used in single-sample mode they are treated like `PixelInterlockOrderedEXT` or `PixelInterlockUnorderedEXT` respectively.

The `ShadingRateInterlockOrderedEXT` and `ShadingRateInterlockUnorderedEXT` execution modes provide mutual exclusion for pairs of fragments that both have at least one common sample in the same pixel, even if none of the common samples are covered by both fragments. With sample shading enabled, these execution modes are treated like `SampleInterlockOrderedEXT` or `SampleInterlockUnorderedEXT` respectively.

## 8.12. Compute Shaders

Compute shaders are invoked via `vkCmdDispatch` and `vkCmdDispatchIndirect` commands. In general, they have access to similar resources as shader stages executing as part of a graphics pipeline.

Compute workloads are formed from groups of work items called workgroups and processed by the compute shader in the current compute pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Compute shaders execute in *global workgroups* which are divided into a number of *local workgroups* with a size that **can** be set by assigning a value to the `LocalSize` execution mode or via an object decorated by the `WorkgroupSize` decoration. An invocation within a local workgroup **can** share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

## 8.13. Interpolation Decorations

Interpolation decorations control the behavior of attribute interpolation in the fragment shader stage. Interpolation decorations **can** be applied to `Input` storage class variables in the fragment shader stage's interface, and control the interpolation behavior of those variables.

Inputs that could be interpolated **can** be decorated by at most one of the following decorations:

- `Flat`: no interpolation
- `NoPerspective`: linear interpolation (for `lines` and `polygons`)

Fragment input variables decorated with neither `Flat` nor `NoPerspective` use perspective-correct interpolation (for `lines` and `polygons`).

The presence of and type of interpolation is controlled by the above interpolation decorations as well as the auxiliary decorations `Centroid` and `Sample`.

A variable decorated with `Flat` will not be interpolated. Instead, it will have the same value for every fragment within a triangle. This value will come from a single `provoking vertex`. A variable decorated with `Flat` **can** also be decorated with `Centroid` or `Sample`, which will mean the same thing as decorating it only as `Flat`.

For fragment shader input variables decorated with neither `Centroid` nor `Sample`, the assigned variable **may** be interpolated anywhere within the fragment and a single value **may** be assigned to each sample within the fragment.

If a fragment shader input is decorated with `Centroid`, a single value **may** be assigned to that variable for all samples in the fragment, but that value **must** be interpolated to a location that lies in both the fragment and in the primitive being rendered, including any of the fragment's samples covered by the primitive. Because the location at which the variable is interpolated **may** be different in neighboring fragments, and derivatives **may** be computed by computing differences between neighboring fragments, derivatives of centroid-sampled inputs **may** be less accurate than those for non-centroid interpolated variables. If

`VkPipelineViewportShadingRateImageStateCreateInfoNV::shadingRateImageEnable` is enabled, implementations **may** estimate derivatives using differencing without dividing by the distance between adjacent sample locations when the fragment size is larger than one pixel. The `PostDepthCoverage` execution mode does not affect the determination of the centroid location.

If a fragment shader input is decorated with `Sample`, a separate value **must** be assigned to that variable for each covered sample in the fragment, and that value **must** be sampled at the location of the individual sample. When `rasterizationSamples` is `VK_SAMPLE_COUNT_1_BIT`, the fragment center **must** be used for `Centroid`, `Sample`, and undecorated attribute interpolation.

Fragment shader inputs that are signed or unsigned integers, integer vectors, or any double-precision floating-point type **must** be decorated with `Flat`.

When the `VK_AMD_shader_explicit_vertex_parameter` device extension is enabled inputs **can** be also decorated with the `CustomInterpAMD` interpolation decoration, including fragment shader inputs that are signed or unsigned integers, integer vectors, or any double-precision floating-point type. Inputs decorated with `CustomInterpAMD` **can** only be accessed by the extended instruction `InterpolateAtVertexAMD` and allows accessing the value of the input for individual vertices of the primitive.

When the `fragmentShaderBarycentric` feature is enabled, inputs **can** be also decorated with the `PerVertexNV` interpolation decoration, including fragment shader inputs that are signed or unsigned integers, integer vectors, or any double-precision floating-point type. Inputs decorated with `PerVertexNV` **can** only be accessed using an extra array dimension, where the extra index identifies one of the vertices of the primitive that produced the fragment.

## 8.14. Ray Generation Shaders

A ray generation shader is similar to a compute shader. Its main purpose is to execute ray tracing queries using `OpTraceNV` instructions and process the results.

### 8.14.1. Ray Generation Shader Execution

One ray generation shader is executed per ray tracing dispatch. Its location in the shader binding table (see [Shader Binding Table](#) for details) is passed directly into `vkCmdTraceRaysNV` using the `raygenShaderBindingTableBuffer` and `raygenShaderBindingOffset` parameters.

## 8.15. Intersection Shaders

Intersection shaders enable the implementation of arbitrary, application defined geometric primitives. An intersection shader for a primitive is executed whenever its axis-aligned bounding box is hit by a ray.

A built-in intersection shader for triangle primitives that is used automatically whenever geometry of type `VK_GEOMETRY_TYPE_TRIANGLES_NV` is specified.

Like other ray tracing shader domains, an intersection shader operates on a single ray at a time. It also operates on a single primitive at a time. It is therefore the purpose of an intersection shader to compute the ray-primitive intersections and report them. To report an intersection, the shader calls the `OpReportIntersectionNV` instruction.

An intersection shader communicates with any-hit and closest shaders by generating attribute values that they **can** read. Intersection shaders **cannot** read or modify the ray payload.

### 8.15.1. Intersection Shader Execution

The order in which intersections are found along a ray, and therefore the order in which intersection shaders are executed, is unspecified.

The intersection shader of the closest AABB which intersects the ray is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

## 8.16. Any-Hit Shaders

The any-hit shader is executed after the intersection shader reports an intersection that lies within the current [tmin,tmax] of the ray. The main use of any-hit shaders is to programmatically decide whether or not an intersection will be accepted. The intersection will be accepted unless the shader calls the `OpIgnoreIntersectionNV` instruction.

### 8.16.1. Any-Hit Shader Execution

The order in which intersections are found along a ray, and therefore the order in which any-hit shaders are executed, is unspecified.

The any-hit shader of the closest hit is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

## 8.17. Closest Hit Shaders

Closest hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and **can** read or modify the ray payload. They also have access to a number of system-generated values. Closest hit shaders **can** call `OpTraceNV` to recursively trace rays.

### 8.17.1. Closest Hit Shader Execution

Exactly one closest hit shader is executed when traversal is finished and an intersection has been found and accepted.

## 8.18. Miss Shaders

Miss shaders **can** access the ray payload and **can** trace new rays through the `OpTraceNV` instruction, but **cannot** access attributes since they are not associated with an intersection.

### 8.18.1. Miss Shader Execution

A miss shader is executed instead of a closest hit shader if no intersection was found during traversal.

## 8.19. Callable Shaders

Callable shaders **can** access a callable payload that works similarly to ray payloads to do subroutine work.

### 8.19.1. Callable Shader Execution

A callable shader is executed by calling `OpExecuteCallableNV` from an allowed shader stage.

## 8.20. Static Use

A SPIR-V module declares a global object in memory using the `OpVariable` instruction, which results in a pointer `x` to that object. A specific entry point in a SPIR-V module is said to *statically use* that object if that entry point's call tree contains a function containing a memory instruction or image instruction with `x` as an `id` operand. See the “Memory Instructions” and “Image Instructions” subsections of section 3 “Binary Form” of the SPIR-V specification for the complete list of SPIR-V memory instructions.

Static use is not used to control the behavior of variables with `Input` and `Output` storage. The effects of those variables are applied based only on whether they are present in a shader entry point's interface.

## 8.21. Invocation and Derivative Groups

An *invocation group* (see the subsection “Control Flow” of section 2 of the SPIR-V specification) for a compute shader is the set of invocations in a single local workgroup. For graphics shaders, an invocation group is an implementation-dependent subset of the set of shader invocations of a given shader stage which are produced by a single drawing command. For indirect drawing commands with `drawCount` greater than one, invocations from separate draws are in distinct invocation groups.

*Note*

Because the partitioning of invocations into invocation groups is implementation-dependent and not observable, applications generally need to assume the worst case of all invocations in a draw belonging to a single invocation group.

A *derivative group* (see the subsection “Control Flow” of section 2 of the SPIR-V 1.00 Revision 4 specification) is a set of invocations which are used together to compute a derivative. For a fragment shader, a derivative group is generated by a single primitive (point, line, or triangle) and includes any helper invocations needed to compute derivatives. If the `subgroupSize` field of [VkPhysicalDeviceSubgroupProperties](#) is at least 4, a derivative group for a fragment shader corresponds to a single subgroup quad. Otherwise, a derivative group is the set of invocations generated by a single primitive. A derivative group for a compute shader is a single local workgroup.

Derivative values are undefined for a sampled image instruction if the instruction is in flow control that is not uniform across the derivative group.

## 8.22. Subgroups

A *subgroup* (see the subsection “Control Flow” of section 2 of the SPIR-V 1.3 Revision 1 specification) is a set of invocations that can synchronize and share data with each other efficiently. An invocation group is partitioned into one or more subgroups.

Subgroup operations are divided into various categories as described in [VkSubgroupFeatureFlagBits](#).

### 8.22.1. Basic Subgroup Operations

The basic subgroup operations allow two classes of functionality within shaders - elect and barrier. Invocations within a subgroup **can** choose a single invocation to perform some task for the subgroup as a whole using elect. Invocations within a subgroup **can** perform a subgroup barrier to ensure the ordering of execution or memory accesses within a subgroup. Barriers **can** be performed on buffer memory accesses, `WorkgroupLocal` memory accesses, and image memory accesses to ensure that any results written are visible by other invocations within the subgroup. An `OpControlBarrier` **can** also be used to perform a full execution control barrier. A full execution control barrier will ensure that each active invocation within the subgroup reaches a point of execution before any are allowed to continue.

## 8.22.2. Vote Subgroup Operations

The vote subgroup operations allow invocations within a subgroup to compare values across a subgroup. The types of votes enabled are:

- Do all active subgroup invocations agree that an expression is true?
- Do any active subgroup invocations evaluate an expression to true?
- Do all active subgroup invocations have the same value of an expression?

*Note*

These operations are useful in combination with control flow in that they allow for developers to check whether conditions match across the subgroup and choose potentially faster code-paths in these cases.

## 8.22.3. Arithmetic Subgroup Operations

The arithmetic subgroup operations allow invocations to perform scan and reduction operations across a subgroup. For reduction operations, each invocation in a subgroup will obtain the same result of these arithmetic operations applied across the subgroup. For scan operations, each invocation in the subgroup will perform an inclusive or exclusive scan, cumulatively applying the operation across the invocations in a subgroup in an implementation-defined order. The operations supported are add, mul, min, max, and, or, xor.

## 8.22.4. Ballot Subgroup Operations

The ballot subgroup operations allow invocations to perform more complex votes across the subgroup. The ballot functionality allows all invocations within a subgroup to provide a boolean value and get as a result what each invocation provided as their boolean value. The broadcast functionality allows values to be broadcast from an invocation to all other invocations within the subgroup, given that the invocation to be broadcast from is known at pipeline creation time.

## 8.22.5. Shuffle Subgroup Operations

The shuffle subgroup operations allow invocations to read values from other invocations within a subgroup.

## 8.22.6. Shuffle Relative Subgroup Operations

The shuffle relative subgroup operations allow invocations to read values from other invocations within the subgroup relative to the current invocation in the group. The relative operations supported allow data to be shifted up and down through the invocations within a subgroup.

## 8.22.7. Clustered Subgroup Operations

The clustered subgroup operations allow invocations to perform an operation among partitions of a subgroup, such that the operation is only performed within the subgroup invocations within a partition. The partitions for clustered subgroup operations are consecutive power-of-two size

groups of invocations and the cluster size **must** be known at pipeline creation time. The operations supported are add, mul, min, max, and, or, xor.

## 8.22.8. Quad Subgroup Operations

The quad subgroup operations allow clusters of 4 invocations (a quad), to share data efficiently with each other. For fragment shaders, if the `subgroupSize` field of `VkPhysicalDeviceSubgroupProperties` is at least 4, each quad corresponds to one of the groups of four shader invocations used for `derivatives`. For compute shaders using the `DerivativeGroupQuadsNV` or `DerivativeGroupLinearNV` execution modes, each quad corresponds to one of the groups of four shader invocations used for `derivatives`. The invocations in each quad are ordered to have attribute values of  $P_{i0,j0}$ ,  $P_{i1,j0}$ ,  $P_{i0,j1}$ , and  $P_{i1,j1}$ , respectively.

## 8.22.9. Partitioned Subgroup Operations

The partitioned subgroup operations allow a subgroup to partition its invocations into disjoint subsets and to perform scan and reduce operations among invocations belonging to the same subset. The partitions for partitioned subgroup operations are specified by a ballot operation and **can** be computed at runtime. The operations supported are add, mul, min, max, and, or, xor.

# 8.23. Cooperative Matrices

A *cooperative matrix* type is a SPIR-V type where the storage for and computations performed on the matrix are spread across a set of invocations such as a subgroup. These types give the implementation freedom in how to optimize matrix multiplies.

SPIR-V defines the types and instructions, but does not specify rules about what sizes/combinations are valid, and it is expected that different implementations **may** support different sizes.

To enumerate the supported cooperative matrix types and operations, call:

```
VkResult vkGetPhysicalDeviceCooperativeMatrixPropertiesNV(  
    VkPhysicalDevice           physicalDevice,  
    uint32_t*                  pPropertyCount,  
    VkCooperativeMatrixPropertiesNV* pProperties);
```

- `physicalDevice` is the physical device.
- `pPropertyCount` is a pointer to an integer related to the number of cooperative matrix properties available or queried.
- `pProperties` is either `NULL` or a pointer to an array of `VkCooperativeMatrixPropertiesNV` structures.

If `pProperties` is `NULL`, then the number of cooperative matrix properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` **must** point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of cooperative matrix properties available, at most `pPropertyCount` structures will be written. If `pPropertyCount` is

smaller than the number of cooperative matrix properties available, `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available cooperative matrix properties were returned.

## Valid Usage (Implicit)

- `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- `pPropertyCount` **must** be a valid pointer to a `uint32_t` value
- If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkCooperativeMatrixPropertiesNV` structures

## Return Codes

### Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Each `VkCooperativeMatrixPropertiesNV` structure describes a single supported combination of types for a matrix multiply/add operation (`OpCooperativeMatrixMulAddNV`). The multiply **can** be described in terms of the following variables and types (in SPIR-V pseudocode):

```
%A is of type OpTypeCooperativeMatrixNV %AType %scope %MSize %KSize  
%B is of type OpTypeCooperativeMatrixNV %BType %scope %KSize %NSize  
%C is of type OpTypeCooperativeMatrixNV %CType %scope %MSize %NSize  
%D is of type OpTypeCooperativeMatrixNV %DType %scope %MSize %NSize  
  
%D = %A * %B + %C // using OpCooperativeMatrixMulAddNV
```

A matrix multiply with these dimensions is known as an  $M \times N \times K$  matrix multiply.

The `VkCooperativeMatrixPropertiesNV` structure is defined as:

```

typedef struct VkCooperativeMatrixPropertiesNV {
    VkStructureType      sType;
    void*              pNext;
    uint32_t             MSize;
    uint32_t             NSize;
    uint32_t             KSize;
    VkComponentTypeNV   AType;
    VkComponentTypeNV   BType;
    VkComponentTypeNV   CType;
    VkComponentTypeNV   DType;
    VkScopeNV            scope;
} VkCooperativeMatrixPropertiesNV;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **MSize** is the number of rows in matrices A, C, and D.
- **KSize** is the number of columns in matrix A and rows in matrix B.
- **NSize** is the number of columns in matrices B, C, D.
- **AType** is the component type of matrix A, of type [VkComponentTypeNV](#).
- **BType** is the component type of matrix B, of type [VkComponentTypeNV](#).
- **CType** is the component type of matrix C, of type [VkComponentTypeNV](#).
- **DType** is the component type of matrix D, of type [VkComponentTypeNV](#).
- **scope** is the scope of all the matrix types, of type [VkScopeNV](#).

If some types are preferred over other types (e.g. for performance), they **should** appear earlier in the list enumerated by [vkGetPhysicalDeviceCooperativeMatrixPropertiesNV](#).

At least one entry in the list **must** have power of two values for all of **MSize**, **KSize**, and **NSize**.

## Valid Usage (Implicit)

- **sType** **must** be [VK\\_STRUCTURE\\_TYPE\\_COOPERATIVE\\_MATRIX\\_PROPERTIES\\_NV](#)
- **pNext** **must** be **NULL**
- **AType** **must** be a valid [VkComponentTypeNV](#) value
- **BType** **must** be a valid [VkComponentTypeNV](#) value
- **CType** **must** be a valid [VkComponentTypeNV](#) value
- **DType** **must** be a valid [VkComponentTypeNV](#) value
- **scope** **must** be a valid [VkScopeNV](#) value

Possible values for [VkScopeNV](#) include:

```

typedef enum VkScopeNV {
    VK_SCOPE_DEVICE_NV = 1,
    VK_SCOPE_WORKGROUP_NV = 2,
    VK_SCOPE_SUBGROUP_NV = 3,
    VK_SCOPE_QUEUE_FAMILY_NV = 5,
    VK_SCOPE_MAX_ENUM_NV = 0x7FFFFFFF
} VkScopeNV;

```

- **VK\_SCOPE\_DEVICE\_NV** corresponds to SPIR-V **Device** scope.
- **VK\_SCOPE\_WORKGROUP\_NV** corresponds to SPIR-V **Workgroup** scope.
- **VK\_SCOPE\_SUBGROUP\_NV** corresponds to SPIR-V **Subgroup** scope.
- **VK\_SCOPE\_QUEUE\_FAMILY\_NV** corresponds to SPIR-V **QueueFamilyKHR** scope.

All enum values match the corresponding SPIR-V value.

Possible values for **VkComponentTypeNV** include:

```

typedef enum VkComponentTypeNV {
    VK_COMPONENT_TYPE_FLOAT16_NV = 0,
    VK_COMPONENT_TYPE_FLOAT32_NV = 1,
    VK_COMPONENT_TYPE_FLOAT64_NV = 2,
    VK_COMPONENT_TYPE_SINT8_NV = 3,
    VK_COMPONENT_TYPE_SINT16_NV = 4,
    VK_COMPONENT_TYPE_SINT32_NV = 5,
    VK_COMPONENT_TYPE_SINT64_NV = 6,
    VK_COMPONENT_TYPE_UINT8_NV = 7,
    VK_COMPONENT_TYPE_UINT16_NV = 8,
    VK_COMPONENT_TYPE_UINT32_NV = 9,
    VK_COMPONENT_TYPE_UINT64_NV = 10,
    VK_COMPONENT_TYPE_MAX_ENUM_NV = 0x7FFFFFFF
} VkComponentTypeNV;

```

- **VK\_COMPONENT\_TYPE\_FLOAT16\_NV** corresponds to SPIR-V **OpTypeFloat** 16.
- **VK\_COMPONENT\_TYPE\_FLOAT32\_NV** corresponds to SPIR-V **OpTypeFloat** 32.
- **VK\_COMPONENT\_TYPE\_FLOAT64\_NV** corresponds to SPIR-V **OpTypeFloat** 64.
- **VK\_COMPONENT\_TYPE\_SINT8\_NV** corresponds to SPIR-V **OpTypeInt** 8 1.
- **VK\_COMPONENT\_TYPE\_SINT16\_NV** corresponds to SPIR-V **OpTypeInt** 16 1.
- **VK\_COMPONENT\_TYPE\_SINT32\_NV** corresponds to SPIR-V **OpTypeInt** 32 1.
- **VK\_COMPONENT\_TYPE\_SINT64\_NV** corresponds to SPIR-V **OpTypeInt** 64 1.
- **VK\_COMPONENT\_TYPE\_UINT8\_NV** corresponds to SPIR-V **OpTypeInt** 8 0.
- **VK\_COMPONENT\_TYPE\_UINT16\_NV** corresponds to SPIR-V **OpTypeInt** 16 0.
- **VK\_COMPONENT\_TYPE\_UINT32\_NV** corresponds to SPIR-V **OpTypeInt** 32 0.

- `VK_COMPONENT_TYPE_UINT64_NV` corresponds to SPIR-V `OpTypeInt` 64 0.

## 8.24. Validation Cache

Validation cache objects allow the result of internal validation to be reused, both within a single application run and between multiple runs. Reuse within a single run is achieved by passing the same validation cache object when creating supported Vulkan objects. Reuse across runs of an application is achieved by retrieving validation cache contents in one run of an application, saving the contents, and using them to preinitialize a validation cache on a subsequent run. The contents of the validation cache objects are managed by the validation layers. Applications **can** manage the host memory consumed by a validation cache object and control the amount of data retrieved from a validation cache object.

Validation cache objects are represented by `VkValidationCacheEXT` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkValidationCacheEXT)
```

To create validation cache objects, call:

```
VkResult vkCreateValidationCacheEXT(
    VkDevice                                     device,
    const VkValidationCacheCreateInfoEXT*        pCreateInfo,
    const VkAllocationCallbacks*                 pAllocator,
    VkValidationCacheEXT*                      pValidationCache);
```

- `device` is the logical device that creates the validation cache object.
- `pCreateInfo` is a pointer to a `VkValidationCacheCreateInfoEXT` structure containing the initial parameters for the validation cache object.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pValidationCache` is a pointer to a `VkValidationCacheEXT` handle in which the resulting validation cache object is returned.

*Note*

Applications **can** track and manage the total host memory size of a validation cache object using the `pAllocator`. Applications **can** limit the amount of data retrieved from a validation cache object in `vkGetValidationCacheDataEXT`. Implementations **should** not internally limit the total number of entries added to a validation cache object or the total host memory consumed.

Once created, a validation cache **can** be passed to the `vkCreateShaderModule` command as part of the `VkShaderModuleCreateInfo pNext` chain. If a `VkShaderModuleValidationCacheCreateInfoEXT` object is part of the `VkShaderModuleCreateInfo::pNext` chain, and its `validationCache` field is not `VK_NULL_HANDLE`, the implementation will query it for possible reuse opportunities and update it with new content. The use of the validation cache object in these commands is internally synchronized, and the same validation cache object **can** be used in multiple threads simultaneously.

### Note

Implementations **should** make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the duration of the `vkCreateShaderModule` command.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkValidationCacheCreateInfoEXT` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pValidationCache` **must** be a valid pointer to a `VkValidationCacheEXT` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkValidationCacheCreateInfoEXT` structure is defined as:

```
typedef struct VkValidationCacheCreateInfoEXT {
    VkStructureType           sType;
    const void*               pNext;
    VkValidationCacheCreateFlagsEXT flags;
    size_t                    initialDataSize;
    const void*               pInitialData;
} VkValidationCacheCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is reserved for future use.
- `initialDataSize` is the number of bytes in `pInitialData`. If `initialDataSize` is zero, the validation cache will initially be empty.
- `pInitialData` is a pointer to previously retrieved validation cache data. If the validation cache data is incompatible (as defined below) with the device, the validation cache will be initially empty. If `initialDataSize` is zero, `pInitialData` is ignored.

## Valid Usage

- If `initialDataSize` is not `0`, it **must** be equal to the size of `pInitialData`, as returned by `vkGetValidationCacheDataEXT` when `pInitialData` was originally retrieved
- If `initialDataSize` is not `0`, `pInitialData` **must** have been retrieved from a previous call to `vkGetValidationCacheDataEXT`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_VALIDATION_CACHE_CREATE_INFO_EXT`
- `pNext` **must** be `NULL`
- `flags` **must** be `0`
- If `initialDataSize` is not `0`, `pInitialData` **must** be a valid pointer to an array of `initialDataSize` bytes

```
typedef VkFlags VkValidationCacheCreateFlagsEXT;
```

`VkValidationCacheCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

Validation cache objects **can** be merged using the command:

```
VkResult vkMergeValidationCachesEXT(  
    VkDevice                                     device,  
    VkValidationCacheEXT                         dstCache,  
    uint32_t                                      srcCacheCount,  
    const VkValidationCacheEXT*                  pSrcCaches);
```

- `device` is the logical device that owns the validation cache objects.
- `dstCache` is the handle of the validation cache to merge results into.
- `srcCacheCount` is the length of the `pSrcCaches` array.
- `pSrcCaches` is a pointer to an array of validation cache handles, which will be merged into `dstCache`. The previous contents of `dstCache` are included after the merge.

### Note

The details of the merge operation are implementation dependent, but implementations **should** merge the contents of the specified validation caches and prune duplicate entries.

## Valid Usage

- `dstCache` **must** not appear in the list of source caches

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `dstCache` **must** be a valid `VkValidationCacheEXT` handle
- `pSrcCaches` **must** be a valid pointer to an array of `srcCacheCount` valid `VkValidationCacheEXT` handles
- `srcCacheCount` **must** be greater than 0
- `dstCache` **must** have been created, allocated, or retrieved from `device`
- Each element of `pSrcCaches` **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `dstCache` **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Data **can** be retrieved from a validation cache object using the command:

```
VkResult vkGetValidationCacheDataEXT(  
    VkDevice                                     device,  
    VkValidationCacheEXT                         validationCache,  
    size_t*                                       pDatasize,  
    void*                                         pData);
```

- `device` is the logical device that owns the validation cache.
- `validationCache` is the validation cache to retrieve data from.
- `pDatasize` is a pointer to a value related to the amount of data in the validation cache, as described below.
- `pData` is either `NULL` or a pointer to a buffer.

If `pData` is `NULL`, then the maximum size of the data that **can** be retrieved from the validation cache, in bytes, is returned in `pDataSize`. Otherwise, `pDataSize` **must** point to a variable set by the user to the size of the buffer, in bytes, pointed to by `pData`, and on return the variable is overwritten with the amount of data actually written to `pData`.

If `pDataSize` is less than the maximum size that **can** be retrieved by the validation cache, at most `pDataSize` bytes will be written to `pData`, and `vkGetValidationCacheDataEXT` will return `VK_INCOMPLETE`. Any data written to `pData` is valid and **can** be provided as the `pInitialData` member of the `VkValidationCacheCreateInfoEXT` structure passed to `vkCreateValidationCacheEXT`.

Two calls to `vkGetValidationCacheDataEXT` with the same parameters **must** retrieve the same data unless a command that modifies the contents of the cache is called between them.

Applications **can** store the data retrieved from the validation cache, and use these data, possibly in a future run of the application, to populate new validation cache objects. The results of validation, however, **may** depend on the vendor ID, device ID, driver version, and other details of the device. To enable applications to detect when previously retrieved data is incompatible with the device, the initial bytes written to `pData` **must** be a header consisting of the following members:

*Table 11. Layout for validation cache header version VK\_VALIDATION\_CACHE\_HEADER\_VERSION\_ONE\_EXT*

Offset	Size	Meaning
0	4	length in bytes of the entire validation cache header written as a stream of bytes, with the least significant byte first
4	4	a <code>VkValidationCacheHeaderVersionEXT</code> value written as a stream of bytes, with the least significant byte first
8	<code>VK_UUID_SIZE</code>	a layer commit ID expressed as a UUID, which uniquely identifies the version of the validation layers used to generate these validation results

The first four bytes encode the length of the entire validation cache header, in bytes. This value includes all fields in the header including the validation cache version field and the size of the length field.

The next four bytes encode the validation cache version, as described for `VkValidationCacheHeaderVersionEXT`. A consumer of the validation cache **should** use the cache version to interpret the remainder of the cache header.

If `pDataSize` is less than what is necessary to store this header, nothing will be written to `pData` and zero will be written to `pDataSize`.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `validationCache` **must** be a valid `VkValidationCacheEXT` handle
- `pDataSize` **must** be a valid pointer to a `size_t` value
- If the value referenced by `pDataSize` is not `0`, and `pData` is not `NULL`, `pData` **must** be a valid pointer to an array of `pDataSize` bytes
- `validationCache` **must** have been created, allocated, or retrieved from `device`

## Return Codes

### Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Possible values of the second group of four bytes in the header returned by `vkGetValidationCacheDataEXT`, encoding the validation cache version, are:

```
typedef enum VkValidationCacheHeaderVersionEXT {
    VK_VALIDATION_CACHE_HEADER_VERSION_ONE_EXT = 1,
    VK_VALIDATION_CACHE_HEADER_VERSION_MAX_ENUM_EXT = 0x7FFFFFFF
} VkValidationCacheHeaderVersionEXT;
```

- `VK_VALIDATION_CACHE_HEADER_VERSION_ONE_EXT` specifies version one of the validation cache.

To destroy a validation cache, call:

```
void vkDestroyValidationCacheEXT(
    VkDevice                                     device,
    VkValidationCacheEXT                         validationCache,
    const VkAllocationCallbacks*                  pAllocator);
```

- `device` is the logical device that destroys the validation cache object.
- `validationCache` is the handle of the validation cache to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- If `VkAllocationCallbacks` were provided when `validationCache` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `validationCache` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `validationCache` is not `VK_NULL_HANDLE`, `validationCache` **must** be a valid `VkValidationCacheEXT` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `validationCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `validationCache` **must** be externally synchronized

# Chapter 9. Pipelines

The following [figure](#) shows a block diagram of the Vulkan pipelines. Some Vulkan commands specify geometric objects to be drawn or computational work to be performed, while others specify state controlling how objects are handled by the various pipeline stages, or control data transfer between memory organized as images and buffers. Commands are effectively sent through a processing pipeline, either a *graphics pipeline*, a *compute pipeline*, or a *ray tracing pipeline*.

The graphics pipeline can be operated in two modes, as either *primitive shading* or *mesh shading* pipeline.

## Primitive Shading

The first stage of the [graphics pipeline](#) ([Input Assembler](#)) assembles vertices to form geometric primitives such as points, lines, and triangles, based on a requested primitive topology. In the next stage ([Vertex Shader](#)) vertices **can** be transformed, computing positions and attributes for each vertex. If [tessellation](#) and/or [geometry](#) shaders are supported, they **can** then generate multiple primitives from a single input primitive, possibly changing the primitive topology or generating additional attribute data in the process.

## Mesh Shading

When using the [mesh shading](#) pipeline input primitives are not assembled implicitly, but explicitly through the ([Mesh Shader](#)). The work on the mesh pipeline is initiated by the application [drawing](#) a set of mesh tasks.

If an optional ([Task Shader](#)) is active, each task triggers the execution of a task shader workgroup that will generate a new set of tasks upon completion. Each of these spawned tasks, or each of the original dispatched tasks if no task shader is present, triggers the execution of a mesh shader workgroup that produces an output mesh with a variable-sized number of primitives assembled from vertices stored in the output mesh.

## Common

The final resulting primitives are [clipped](#) to a clip volume in preparation for the next stage, [Rasterization](#). The rasterizer produces a series of framebuffer addresses and values using a two-dimensional description of a point, line segment, or triangle. Each *fragment* so produced is fed to the next stage ([Fragment Shader](#)) that performs operations on individual fragments before they finally alter the framebuffer. These operations include conditional updates into the framebuffer based on incoming and previously stored depth values (to effect [depth buffering](#)), [blending](#) of incoming fragment colors with stored colors, as well as [masking](#), [stenciling](#), and other [logical operations](#) on fragment values.

Framebuffer operations read and write the color and depth/stencil attachments of the framebuffer for a given subpass of a [render pass instance](#). The attachments **can** be used as input attachments in the fragment shader in a later subpass of the same render pass.

The [compute pipeline](#) is a separate pipeline from the graphics pipeline, which operates on one-, two-, or three-dimensional workgroups which **can** read from and write to buffer and image

memory.

This ordering is meant only as a tool for describing Vulkan, not as a strict rule of how Vulkan is implemented, and we present it only as a means to organize the various operations of the pipelines. Actual ordering guarantees between pipeline stages are explained in detail in the [synchronization chapter](#).

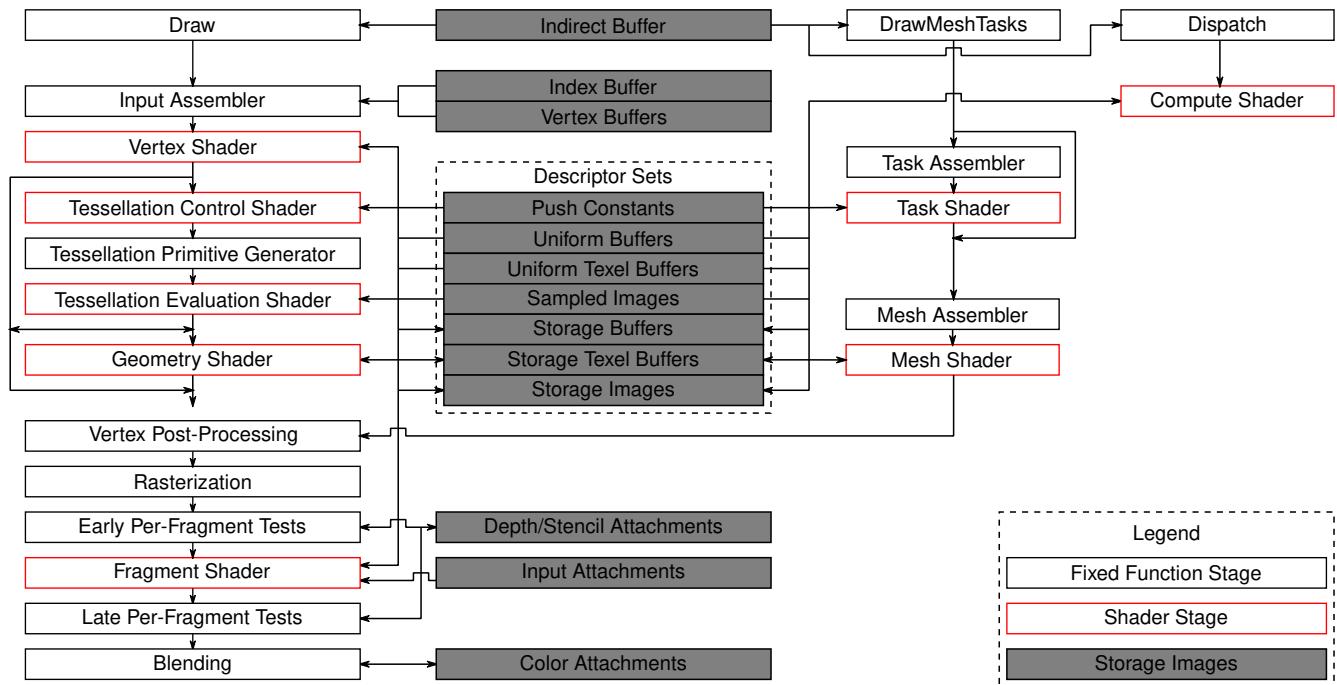

Figure 2. Block diagram of the Vulkan pipeline

Each pipeline is controlled by a monolithic object created from a description of all of the shader stages and any relevant fixed-function stages. [Linking](#) the whole pipeline together allows the optimization of shaders based on their input/outputs and eliminates expensive draw time state validation.

A pipeline object is bound to the current state using `vkCmdBindPipeline`. Any pipeline object state that is specified as `dynamic` is not applied to the current state when the pipeline object is bound, but is instead set by dynamic state setting commands.

No state, including dynamic state, is inherited from one command buffer to another.

Compute, graphics, and ray tracing pipelines are each represented by `VkPipeline` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipeline)
```

## 9.1. Compute Pipelines

Compute pipelines consist of a single static compute shader stage and the pipeline layout.

The compute pipeline represents a compute shader and is created by calling `vkCreateComputePipelines` with `module` and `pName` selecting an entry point from a shader module, where that entry point defines a valid compute shader, in the `VkPipelineShaderStageCreateInfo`

structure contained within the `VkComputePipelineCreateInfo` structure.

To create compute pipelines, call:

```
VkResult vkCreateComputePipelines(  
    VkDevice                                     device,  
    VkPipelineCache                            pipelineCache,  
    uint32_t                                    createInfoCount,  
    const VkComputePipelineCreateInfo*          pCreateInfos,  
    const VkAllocationCallbacks*                pAllocator,  
    VkPipeline*                                 pPipelines);
```

- `device` is the logical device that creates the compute pipelines.
- `pipelineCache` is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled; or the handle of a valid `pipeline cache` object, in which case use of that cache is enabled for the duration of the command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of `VkComputePipelineCreateInfo` structures.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pPipelines` is a pointer to an array of `VkPipeline` handles in which the resulting compute pipeline objects are returned.

## Valid Usage

- If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the `basePipelineIndex` member of that same element is not `-1`, `basePipelineIndex` **must** be less than the index into `pCreateInfos` that corresponds to that element
- If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline **must** have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` **must** be a valid `VkPipelineCache` handle
- `pCreateInfos` **must** be a valid pointer to an array of `createInfoCount` valid `VkComputePipelineCreateInfo` structures
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pPipelines` **must** be a valid pointer to an array of `createInfoCount` `VkPipeline` handles
- `createInfoCount` **must** be greater than `0`
- If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_SHADER_NV`

The `VkComputePipelineCreateInfo` structure is defined as:

```
typedef struct VkComputePipelineCreateInfo {
    VkStructureType           sType;
    const void*                pNext;
    VkPipelineCreateFlags       flags;
    VkPipelineShaderStageCreateInfo stage;
    VkPipelineLayout             layout;
    VkPipeline                  basePipelineHandle;
    int32_t                     basePipelineIndex;
} VkComputePipelineCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- `stage` is a `VkPipelineShaderStageCreateInfo` structure describing the compute shader.
- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.

- `basePipelineHandle` is a pipeline to derive from
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in [Pipeline Derivatives](#).

## Valid Usage

- If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` **must** be a valid handle to a compute `VkPipeline`
- If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` **must** be a valid index into the calling command's `pCreateInfos` parameter
- If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is not -1, `basePipelineHandle` **must** be `VK_NULL_HANDLE`
- If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is not `VK_NULL_HANDLE`, `basePipelineIndex` **must** be -1
- The `stage` member of `stage` **must** be `VK_SHADER_STAGE_COMPUTE_BIT`
- The shader code for the entry point identified by `stage` and the rest of the state identified by this structure **must** adhere to the pipeline linking rules described in the [Shader Interfaces](#) chapter
- `layout` **must** be consistent with the layout of the compute shader specified in `stage`
- The number of resources in `layout` accessible to the compute shader stage **must** be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_CREATE_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkPipelineCompilerControlCreateInfoAMD` or `VkPipelineCreationFeedbackCreateInfoEXT`
- Each `sType` member in the `pNext` chain **must** be unique
- `flags` **must** be a valid combination of `VkPipelineCreateFlagBits` values
- `stage` **must** be a valid `VkPipelineShaderStageCreateInfo` structure
- `layout` **must** be a valid `VkPipelineLayout` handle
- Both of `basePipelineHandle`, and `layout` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

The `VkPipelineShaderStageCreateInfo` structure is defined as:

```
typedef struct VkPipelineShaderStageCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineShaderStageCreateFlags   flags;
    VkShaderStageFlagBits      stage;
    VkShaderModule              module;
    const char*                pName;
    const VkSpecializationInfo* pSpecializationInfo;
} VkPipelineShaderStageCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is a bitmask of `VkPipelineShaderStageCreateFlagBits` specifying how the pipeline shader stage will be generated.
- `stage` is a `VkShaderStageFlagBits` value specifying a single pipeline stage.
- `module` is a `VkShaderModule` object containing the shader for this stage.
- `pName` is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.
- `pSpecializationInfo` is a pointer to a `VkSpecializationInfo` structure, as described in [Specialization Constants](#), or `NULL`.

## Valid Usage

- If the `geometry shaders` feature is not enabled, `stage` **must** not be `VK_SHADER_STAGE_GEOMETRY_BIT`
- If the `tessellation shaders` feature is not enabled, `stage` **must** not be `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`
- If the `mesh shader` feature is not enabled, `stage` **must** not be `VK_SHADER_STAGE_MESH_BIT_NV`
- If the `task shader` feature is not enabled, `stage` **must** not be `VK_SHADER_STAGE_TASK_BIT_NV`
- `stage` **must** not be `VK_SHADER_STAGE_ALL_GRAPHICS`, or `VK_SHADER_STAGE_ALL`
- `pName` **must** be the name of an `OpEntryPoint` in `module` with an execution model that matches `stage`
- If the identified entry point includes any variable in its interface that is declared with the `ClipDistance BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxClipDistances`
- If the identified entry point includes any variable in its interface that is declared with the `CullDistance BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxCullDistances`
- If the identified entry point includes any variables in its interface that are declared with the `ClipDistance` or `CullDistance BuiltIn` decoration, those variables **must** not have array sizes which sum to more than `VkPhysicalDeviceLimits::maxCombinedClipAndCullDistances`
- If the identified entry point includes any variable in its interface that is declared with the `SampleMask BuiltIn` decoration, that variable **must** not have an array size greater than `VkPhysicalDeviceLimits::maxSampleMaskWords`
- If `stage` is `VK_SHADER_STAGE_VERTEX_BIT`, the identified entry point **must** not include any input variable in its interface that is decorated with `CullDistance`
- If `stage` is `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, and the identified entry point has an `OpExecutionMode` instruction that specifies a patch size with `OutputVertices`, the patch size **must** be greater than `0` and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`
- If `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction that specifies a maximum output vertex count that is greater than `0` and less than or equal to `VkPhysicalDeviceLimits::maxGeometryOutputVertices`
- If `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction that specifies an invocation count that is greater than `0` and less than or equal to `VkPhysicalDeviceLimits::maxGeometryShaderInvocations`
- If `stage` is a vertex processing stage, and the identified entry point writes to `Layer` for any primitive, it **must** write the same value to `Layer` for all vertices of a given primitive
- If `stage` is a vertex processing stage, and the identified entry point writes to `ViewportIndex` for any primitive, it **must** write the same value to `ViewportIndex` for all vertices of a given primitive

- If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, the identified entry point **must** not include any output variables in its interface decorated with `CullDistance`
- If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragDepth` in any execution path, it **must** write to `FragDepth` in all execution paths
- If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragStencilRefEXT` in any execution path, it **must** write to `FragStencilRefEXT` in all execution paths
- If `stage` is `VK_SHADER_STAGE_MESH_BIT_NV`, the identified entry point **must** have an `OpExecutionMode` instruction that specifies a maximum output vertex count, `OutputVertices`, that is greater than `0` and less than or equal to `VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputVertices`.
- If `stage` is `VK_SHADER_STAGE_MESH_BIT_NV`, the identified entry point **must** have an `OpExecutionMode` instruction that specifies a maximum output primitive count, `OutputPrimitivesNV`, that is greater than `0` and less than or equal to `VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputPrimitives`.
- If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flag set, the `subgroupSizeControl` feature **must** be enabled.
- If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` flag set, the `computeFullSubgroups` feature **must** be enabled.
- If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure is chained to `pNext`, `flags` **must** not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flag set.
- If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure is chained to `pNext`, the `subgroupSizeControl` feature **must** be enabled, and `stage` **must** be a valid bit specified in `requiredSubgroupSizeStages`.
- If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure is chained to `pNext` and `stage` is `VK_SHADER_STAGE_COMPUTE_BIT` then local workgroup size of the shader **must** be less than or equal to the product of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT::requiredSubgroupSize` and `maxComputeWorkgroupSubgroups`.
- If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure is chained to `pNext`, and `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` flag set, the local workgroup size in the X dimension of the pipeline **must** be a multiple of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT::requiredSubgroupSize`.
- If `flags` has both the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` and `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flags set, the local workgroup size in the X dimension of the pipeline **must** be a multiple of `maxSubgroupSize`.
- If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` flag set and `flags` does not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flag set and no `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure is chained to `pNext`, the local workgroup size in the X dimension of the pipeline **must** be a multiple of

`subgroupSize`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO`
- `pNext` **must** be `NULL` or a pointer to a valid instance of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT`
- `flags` **must** be a valid combination of `VkPipelineShaderStageCreateFlagBits` values
- `stage` **must** be a valid `VkShaderStageFlagBits` value
- `module` **must** be a valid `VkShaderModule` handle
- `pName` **must** be a null-terminated UTF-8 string
- If `pSpecializationInfo` is not `NULL`, `pSpecializationInfo` **must** be a valid pointer to a valid `VkSpecializationInfo` structure

```
typedef VkFlags VkPipelineShaderStageCreateFlags;
```

`VkPipelineShaderStageCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineShaderStageCreateFlagBits`.

Possible values of the `flags` member of `VkPipelineShaderStageCreateInfo` specifying how a pipeline shader stage is created, are:

```
typedef enum VkPipelineShaderStageCreateFlagBits {
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT = 0x00000001,
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT = 0x00000002,
    VK_PIPELINE_SHADER_STAGE_CREATE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkPipelineShaderStageCreateFlagBits;
```

- `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` specifies that the `SubgroupSize` **may** vary in the shader stage.
- `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` specifies that the subgroup sizes **must** be launched with all invocations active in the compute stage.

### Note

If `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` and `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` are specified and `minSubgroupSize` does not equal `maxSubgroupSize` and no required subgroup size is specified, then the only way to guarantee that the 'X' dimension of the local workgroup size is a multiple of `SubgroupSize` is to make it a multiple of `maxSubgroupSize`. Under these conditions, you are guaranteed full subgroups but not any particular subgroup size.

Commands and structures which need to specify one or more shader stages do so using a bitmask whose bits correspond to stages. Bits which **can** be set to specify shader stages are:

```
typedef enum VkShaderStageFlagBits {
    VK_SHADER_STAGE_VERTEX_BIT = 0x00000001,
    VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT = 0x00000002,
    VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT = 0x00000004,
    VK_SHADER_STAGE_GEOMETRY_BIT = 0x00000008,
    VK_SHADER_STAGE_FRAGMENT_BIT = 0x00000010,
    VK_SHADER_STAGE_COMPUTE_BIT = 0x00000020,
    VK_SHADER_STAGE_ALL_GRAPHICS = 0x0000001F,
    VK_SHADER_STAGE_ALL = 0x7FFFFFFF,
    VK_SHADER_STAGE_RAYGEN_BIT_NV = 0x00000100,
    VK_SHADER_STAGE_ANY_HIT_BIT_NV = 0x00000200,
    VK_SHADER_STAGE_CLOSEST_HIT_BIT_NV = 0x00000400,
    VK_SHADER_STAGE_MISS_BIT_NV = 0x00000800,
    VK_SHADER_STAGE_INTERSECTION_BIT_NV = 0x00001000,
    VK_SHADER_STAGE_CALLABLE_BIT_NV = 0x00002000,
    VK_SHADER_STAGE_TASK_BIT_NV = 0x00000040,
    VK_SHADER_STAGE_MESH_BIT_NV = 0x00000080,
    VK_SHADER_STAGE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkShaderStageFlagBits;
```

- **VK\_SHADER\_STAGE\_VERTEX\_BIT** specifies the vertex stage.
- **VK\_SHADER\_STAGE\_TESSELLATION\_CONTROL\_BIT** specifies the tessellation control stage.
- **VK\_SHADER\_STAGE\_TESSELLATION\_EVALUATION\_BIT** specifies the tessellation evaluation stage.
- **VK\_SHADER\_STAGE\_GEOMETRY\_BIT** specifies the geometry stage.
- **VK\_SHADER\_STAGE\_FRAGMENT\_BIT** specifies the fragment stage.
- **VK\_SHADER\_STAGE\_COMPUTE\_BIT** specifies the compute stage.
- **VK\_SHADER\_STAGE\_TASK\_BIT\_NV** specifies the task stage.
- **VK\_SHADER\_STAGE\_MESH\_BIT\_NV** specifies the mesh stage.
- **VK\_SHADER\_STAGE\_ALL\_GRAPHICS** is a combination of bits used as shorthand to specify all graphics stages defined above (excluding the compute stage).
- **VK\_SHADER\_STAGE\_ALL** is a combination of bits used as shorthand to specify all shader stages supported by the device, including all additional stages which are introduced by extensions.
- **VK\_SHADER\_STAGE\_RAYGEN\_BIT\_NV** specifies the ray generation stage.
- **VK\_SHADER\_STAGE\_ANY\_HIT\_BIT\_NV** specifies the any-hit stage.
- **VK\_SHADER\_STAGE\_CLOSEST\_HIT\_BIT\_NV** specifies the closest hit stage.
- **VK\_SHADER\_STAGE\_MISS\_BIT\_NV** specifies the miss stage.
- **VK\_SHADER\_STAGE\_INTERSECTION\_BIT\_NV** specifies the intersection stage.
- **VK\_SHADER\_STAGE\_CALLABLE\_BIT\_NV** specifies the callable stage.

*Note*

`VK_SHADER_STAGE_ALL_GRAPHICS` only includes the original five graphics stages included in Vulkan 1.0, and not any stages added by extensions. Thus, it may not have the desired effect in all cases.

```
typedef VkFlags VkShaderStageFlags;
```

`VkShaderStageFlags` is a bitmask type for setting a mask of zero or more `VkShaderStageFlagBits`.

The `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure is defined as:

```
typedef struct VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           requiredSubgroupSize;
} VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `requiredSubgroupSize` is an unsigned integer value that specifies the required subgroup size for the newly created pipeline shader stage.

### Valid Usage

- `requiredSubgroupSize` **must** be a power-of-two integer.
- `requiredSubgroupSize` **must** be greater or equal to `minSubgroupSize`.
- `requiredSubgroupSize` **must** be less than or equal to `maxSubgroupSize`.

If the `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure is included in the `pNext` chain of `VkPipelineShaderStageCreateInfo`, it specifies that the pipeline shader stage being compiled has a required subgroup size.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_REQUIRED_SUBGROUP_SIZE_CREATE_INFO_EXT`

## 9.2. Graphics Pipelines

Graphics pipelines consist of multiple shader stages, multiple fixed-function pipeline stages, and a pipeline layout.

To create graphics pipelines, call:

```
VkResult vkCreateGraphicsPipelines(  
    VkDevice                                     device,  
    VkPipelineCache                            pipelineCache,  
    uint32_t                                    createInfoCount,  
    const VkGraphicsPipelineCreateInfo*        pCreateInfo,  
    const VkAllocationCallbacks*                pAllocator,  
    VkPipeline*                                pPipelines);
```

- `device` is the logical device that creates the graphics pipelines.
- `pipelineCache` is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled; or the handle of a valid `pipeline cache` object, in which case use of that cache is enabled for the duration of the command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of `VkGraphicsPipelineCreateInfo` structures.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pPipelines` is a pointer to an array of `VkPipeline` handles in which the resulting graphics pipeline objects are returned.

The `VkGraphicsPipelineCreateInfo` structure includes an array of shader create info structures containing all the desired active shader stages, as well as creation info to define all relevant fixed-function stages, and a pipeline layout.

## Valid Usage

- If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the `basePipelineIndex` member of that same element is not `-1`, `basePipelineIndex` **must** be less than the index into `pCreateInfos` that corresponds to that element
- If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline **must** have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` **must** be a valid `VkPipelineCache` handle
- `pCreateInfos` **must** be a valid pointer to an array of `createInfoCount` valid `VkGraphicsPipelineCreateInfo` structures
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pPipelines` **must** be a valid pointer to an array of `createInfoCount` `VkPipeline` handles
- `createInfoCount` **must** be greater than `0`
- If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_SHADER_NV`

The `VkGraphicsPipelineCreateInfo` structure is defined as:

```

typedef struct VkGraphicsPipelineCreateInfo {
    VkStructureType
    const void*
    VkPipelineCreateFlags
    uint32_t
    const VkPipelineShaderStageCreateInfo*
    const VkPipelineVertexInputStateCreateInfo*
    const VkPipelineInputAssemblyStateCreateInfo*
    const VkPipelineTessellationStateCreateInfo*
    const VkPipelineViewportStateCreateInfo*
    const VkPipelineRasterizationStateCreateInfo*
    const VkPipelineMultisampleStateCreateInfo*
    const VkPipelineDepthStencilStateCreateInfo*
    const VkPipelineColorBlendStateCreateInfo*
    const VkPipelineDynamicStateCreateInfo*
    VkPipelineLayout
    VkRenderPass
    uint32_t
    VkPipeline
    int32_t
} VkGraphicsPipelineCreateInfo;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **flags** is a bitmask of **VkPipelineCreateFlagBits** specifying how the pipeline will be generated.
- **stageCount** is the number of entries in the **pStages** array.
- **pStages** is a pointer to an array of **stageCount** **VkPipelineShaderStageCreateInfo** structures describing the set of the shader stages to be included in the graphics pipeline.
- **pVertexInputState** is a pointer to a **VkPipelineVertexInputStateCreateInfo** structure. It is ignored if the pipeline includes a mesh shader stage.
- **pInputAssemblyState** is a pointer to a **VkPipelineInputAssemblyStateCreateInfo** structure which determines input assembly behavior, as described in [Drawing Commands](#). It is ignored if the pipeline includes a mesh shader stage.
- **pTessellationState** is a pointer to a **VkPipelineTessellationStateCreateInfo** structure, and is ignored if the pipeline does not include a tessellation control shader stage and tessellation evaluation shader stage.
- **pViewportState** is a pointer to a **VkPipelineViewportStateCreateInfo** structure, and is ignored if the pipeline has rasterization disabled.
- **pRasterizationState** is a pointer to a **VkPipelineRasterizationStateCreateInfo** structure.
- **pMultisampleState** is a pointer to a **VkPipelineMultisampleStateCreateInfo** structure, and is ignored if the pipeline has rasterization disabled.
- **pDepthStencilState** is a pointer to a **VkPipelineDepthStencilStateCreateInfo** structure, and is ignored if the pipeline has rasterization disabled or if the subpass of the render pass the pipeline is created against does not use a depth/stencil attachment.

- `pColorBlendState` is a pointer to a `VkPipelineColorBlendStateCreateInfo` structure, and is ignored if the pipeline has rasterization disabled or if the subpass of the render pass the pipeline is created against does not use any color attachments.
- `pDynamicState` is a pointer to a `VkPipelineDynamicStateCreateInfo` structure, and is used to indicate which properties of the pipeline state object are dynamic and **can** be changed independently of the pipeline state. This **can** be `NULL`, which means no state in the pipeline is considered dynamic.
- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- `renderPass` is a handle to a render pass object describing the environment in which the pipeline will be used; the pipeline **must** only be used with an instance of any render pass compatible with the one provided. See [Render Pass Compatibility](#) for more information.
- `subpass` is the index of the subpass in the render pass where this pipeline will be used.
- `basePipelineHandle` is a pipeline to derive from.
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in [Pipeline Derivatives](#).

If any shader stage fails to compile, the compile log will be reported back to the application, and `VK_ERROR_INVALID_SHADER_NV` will be generated.

## Valid Usage

- If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` **must** be a valid handle to a graphics `VkPipeline`
- If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` **must** be a valid index into the calling command's `pCreateInfos` parameter
- If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is not -1, `basePipelineHandle` **must** be `VK_NULL_HANDLE`
- If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is not `VK_NULL_HANDLE`, `basePipelineIndex` **must** be -1
- The `stage` member of each element of `pStages` **must** be unique
- The geometric shader stages provided in `pStages` **must** be either from the mesh shading pipeline (`stage` is `VK_SHADER_STAGE_TASK_BIT_NV` or `VK_SHADER_STAGE_MESH_BIT_NV`) or from the primitive shading pipeline (`stage` is `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, or `VK_SHADER_STAGE_GEOMETRY_BIT`).
- The `stage` member of one element of `pStages` **must** be either `VK_SHADER_STAGE_VERTEX_BIT` or `VK_SHADER_STAGE_MESH_BIT_NV`.
- The `stage` member of each element of `pStages` **must** not be `VK_SHADER_STAGE_COMPUTE_BIT`
- If `pStages` includes a tessellation control shader stage, it **must** include a tessellation evaluation shader stage
- If `pStages` includes a tessellation evaluation shader stage, it **must** include a tessellation control shader stage
- If `pStages` includes a tessellation control shader stage and a tessellation evaluation shader stage, `pTessellationState` **must** be a valid pointer to a valid `VkPipelineTessellationStateCreateInfo` structure
- If `pStages` includes tessellation shader stages, the shader code of at least one stage **must** contain an `OpExecutionMode` instruction that specifies the type of subdivision in the pipeline
- If `pStages` includes tessellation shader stages, and the shader code of both stages contain an `OpExecutionMode` instruction that specifies the type of subdivision in the pipeline, they **must** both specify the same subdivision mode
- If `pStages` includes tessellation shader stages, the shader code of at least one stage **must** contain an `OpExecutionMode` instruction that specifies the output patch size in the pipeline
- If `pStages` includes tessellation shader stages, and the shader code of both contain an `OpExecutionMode` instruction that specifies the out patch size in the pipeline, they **must** both specify the same patch size
- If `pStages` includes tessellation shader stages, the `topology` member of `pInputAssembly` **must** be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`
- If the `topology` member of `pInputAssembly` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, `pStages`

**must** include tessellation shader stages

- If `pStages` includes a geometry shader stage, and does not include any tessellation shader stages, its shader code **must** contain an `OpExecutionMode` instruction that specifies an input primitive type that is `compatible` with the primitive topology specified in `pInputAssembly`
- If `pStages` includes a geometry shader stage, and also includes tessellation shader stages, its shader code **must** contain an `OpExecutionMode` instruction that specifies an input primitive type that is `compatible` with the primitive topology that is output by the tessellation stages
- If `pStages` includes a fragment shader stage and a geometry shader stage, and the fragment shader code reads from an input variable that is decorated with `PrimitiveID`, then the geometry shader code **must** write to a matching output variable, decorated with `PrimitiveID`, in all execution paths
- If `pStages` includes a fragment shader stage, its shader code **must** not read from any input attachment that is defined as `VK_ATTACHMENT_UNUSED` in `subpass`
- The shader code for the entry points identified by `pStages`, and the rest of the state identified by this structure **must** adhere to the pipeline linking rules described in the [Shader Interfaces](#) chapter
- If rasterization is not disabled and `subpass` uses a depth/stencil attachment in `renderPass` that has a layout of `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` in the `VkAttachmentReference` defined by `subpass`, the `depthWriteEnable` member of `pDepthStencilState` **must** be `VK_FALSE`
- If rasterization is not disabled and `subpass` uses a depth/stencil attachment in `renderPass` that has a layout of `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` in the `VkAttachmentReference` defined by `subpass`, the `failOp`, `passOp` and `depthFailOp` members of each of the `front` and `back` members of `pDepthStencilState` **must** be `VK_STENCIL_OP_KEEP`
- If rasterization is not disabled and the subpass uses color attachments, then for each color attachment in the subpass the `blendEnable` member of the corresponding element of the `pAttachment` member of `pColorBlendState` **must** be `VK_FALSE` if the attached image's `format features` does not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`.
- If rasterization is not disabled and the subpass uses color attachments, the `attachmentCount` member of `pColorBlendState` **must** be equal to the `colorAttachmentCount` used to create `subpass`
- If no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_VIEWPORT`, the `pViewports` member of `pViewportState` **must** be a valid pointer to an array of `pViewportState::viewportCount` valid `VkViewport` structures
- If no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_SCISSOR`, the `pScissors` member of `pViewportState` **must** be a valid pointer to an array of `pViewportState::scissorCount` `VkRect2D` structures
- If the wide lines feature is not enabled, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_LINE_WIDTH`, the `lineWidth` member of `pRasterizationState` **must** be `1.0`
- If the `rasterizerDiscardEnable` member of `pRasterizationState` is `VK_FALSE`, `pViewportState`

**must** be a valid pointer to a valid `VkPipelineViewportStateCreateInfo` structure

- If the `rasterizerDiscardEnable` member of `pRasterizationState` is `VK_FALSE`, `pMultisampleState` **must** be a valid pointer to a valid `VkPipelineMultisampleStateCreateInfo` structure
- If the `rasterizerDiscardEnable` member of `pRasterizationState` is `VK_FALSE`, and `subpass` uses a depth/stencil attachment, `pDepthStencilState` **must** be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure
- If the `rasterizerDiscardEnable` member of `pRasterizationState` is `VK_FALSE`, and `subpass` uses color attachments, `pColorBlendState` **must** be a valid pointer to a valid `VkPipelineColorBlendStateCreateInfo` structure
- If the depth bias clamping feature is not enabled, no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_DEPTH_BIAS`, and the `depthBiasEnable` member of `pRasterizationState` is `VK_TRUE`, the `depthBiasClamp` member of `pRasterizationState` **must** be `0.0`
- If the `VK_EXT_depth_range_unrestricted` extension is not enabled and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_DEPTH_BOUNDS`, and the `depthBoundsTestEnable` member of `pDepthStencilState` is `VK_TRUE`, the `minDepthBounds` and `maxDepthBounds` members of `pDepthStencilState` **must** be between `0.0` and `1.0`, inclusive
- If no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT`, and the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT` structure chained to the `pNext` chain of `pMultisampleState` is `VK_TRUE`, `sampleLocationsInfo.sampleLocationGridSize.width` **must** evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`
- If no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT`, and the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT` structure chained to the `pNext` chain of `pMultisampleState` is `VK_TRUE`, `sampleLocationsInfo.sampleLocationGridSize.height` **must** evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`
- If no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT`, and the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT` structure chained to the `pNext` chain of `pMultisampleState` is `VK_TRUE`, `sampleLocationsInfo.sampleLocationsPerPixel` **must** equal `rasterizationSamples`
- If the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT` structure chained to the `pNext` chain of `pMultisampleState` is `VK_TRUE`, the fragment shader code **must** not statically use the extended instruction `InterpolateAtSample`
- `layout` **must** be consistent with all shaders specified in `pStages`
- If neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, and if `subpass` uses color and/or depth/stencil attachments, then the `rasterizationSamples` member of `pMultisampleState` **must** be the same as the sample

count for those subpass attachments

- If the `VK_AMD_mixed_attachment_samples` extension is enabled, and if `subpass` uses color and/or depth/stencil attachments, then the `rasterizationSamples` member of `pMultisampleState` **must** equal the maximum of the sample counts of those subpass attachments
- If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if `subpass` has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled, then the `rasterizationSamples` member of `pMultisampleState` **must** be the same as the sample count of the depth/stencil attachment
- If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if `subpass` has any color attachments, then the `rasterizationSamples` member of `pMultisampleState` **must** be greater than or equal to the sample count for those subpass attachments
- If the `VK_NV_coverage_reduction_mode` extension is enabled, the coverage reduction mode specified by `VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode`, the `rasterizationSamples` member of `pMultisampleState` and the sample counts for the color and depth/stencil attachments (if the subpass has them) **must** be a valid combination returned by `vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV`
- If `subpass` does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` member of `pMultisampleState` **must** follow the rules for a `zero-attachment` subpass
- `subpass` **must** be a valid subpass within `renderPass`
- If the `renderPass` has multiview enabled and `subpass` has more than one bit set in the view mask and `multiviewTessellationShader` is not enabled, then `pStages` **must** not include tessellation shaders.
- If the `renderPass` has multiview enabled and `subpass` has more than one bit set in the view mask and `multiviewGeometryShader` is not enabled, then `pStages` **must** not include a geometry shader.
- If the `renderPass` has multiview enabled and `subpass` has more than one bit set in the view mask, shaders in the pipeline **must** not write to the `Layer` built-in output
- If the `renderPass` has multiview enabled, then all shaders **must** not include variables decorated with the `Layer` built-in decoration in their interfaces.
- `flags` **must** not contain the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag.
- If `pStages` includes a fragment shader stage and an input attachment was referenced by the `VkRenderPassInputAttachmentAspectCreateInfo` at `renderPass` create time, its shader code **must** not read from any aspect that was not specified in the `aspectMask` of the corresponding `VkInputAttachmentAspectReference` structure.
- The number of resources in `layout` accessible to each shader stage that is used by the pipeline **must** be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`
- If no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV`, and the `viewportWScaleEnable` member of a `VkPipelineViewportWScaleCreateInfoNV` structure, chained to the `pNext` chain of `pViewportState`, is `VK_TRUE`, the `pViewportWScalings` member of the

`VkPipelineViewportWScalingStateCreateInfoNV` **must** be a pointer to an array of `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` valid `VkViewportWScalingNV` structures

- If `pStages` includes a vertex shader stage, `pVertexInputState` **must** be a valid pointer to a valid `VkPipelineVertexInputStateCreateInfo` structure
- If `pStages` includes a vertex shader stage, `pInputAssemblyState` **must** be a valid pointer to a valid `VkPipelineInputAssemblyStateCreateInfo` structure
- The `Xfb` execution mode **can** be specified by only one shader stage in `pStages`
- If any shader stage in `pStages` specifies `Xfb` execution mode it **must** be the last vertex processing stage
- If a `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream` value other than zero is specified, all variables in the output interface of the entry point being compiled decorated with `Position`, `PointSize`, `ClipDistance`, or `CullDistance` **must** all be decorated with identical `Stream` values that match the `rasterizationStream`
- If `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream` is zero, or not specified, all variables in the output interface of the entry point being compiled decorated with `Position`, `PointSize`, `ClipDistance`, or `CullDistance` **must** all be decorated with a `Stream` value of zero, or **must** not specify the `Stream` decoration
- If the last vertex processing stage is a geometry shader, and that geometry shader uses the `GeometryStreams` capability, then `VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams` feature **must** be enabled
- If there are any mesh shader stages in the pipeline there **must** not be any shader stage in the pipeline with a `Xfb` execution mode.
- If the `lineRasterizationMode` member of a `VkPipelineRasterizationLineStateCreateInfoEXT` structure chained to the `pNext` chain of `pRasterizationState` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT` or `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT` and if rasterization is enabled, then the `alphaToCoverageEnable`, `alphaToOneEnable`, and `sampleShadingEnable` members of `pMultisampleState` **must** all be `VK_FALSE`
- If the `stippledLineEnable` member of `VkPipelineRasterizationLineStateCreateInfoEXT` is `VK_TRUE` and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_LINE_STIPPLE_EXT`, then the `lineStippleFactor` member of `VkPipelineRasterizationLineStateCreateInfoEXT` **must** be in the range [1,256]

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkPipelineCompilerControlCreateInfoAMD`, `VkPipelineCreationFeedbackCreateInfoEXT`, `VkPipelineDiscardRectangleStateCreateInfoEXT`, `VkPipelineRepresentativeFragmentTestStateCreateInfoNV` or `VkPipelineRepresentativeFragmentTestStateCreateInfoNV`
- Each `sType` member in the `pNext` chain **must** be unique
- `flags` **must** be a valid combination of `VkPipelineCreateFlagBits` values
- `pStages` **must** be a valid pointer to an array of `stageCount` valid `VkPipelineShaderStageCreateInfo` structures
- `pRasterizationState` **must** be a valid pointer to a valid `VkPipelineRasterizationStateCreateInfo` structure
- If `pDynamicState` is not `NULL`, `pDynamicState` **must** be a valid pointer to a valid `VkPipelineDynamicStateCreateInfo` structure
- `layout` **must** be a valid `VkPipelineLayout` handle
- `renderPass` **must** be a valid `VkRenderPass` handle
- `stageCount` **must** be greater than `0`
- Each of `basePipelineHandle`, `layout`, and `renderPass` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

Possible values of the `flags` member of `VkGraphicsPipelineCreateInfo`, `VkComputePipelineCreateInfo`, and `VkRayTracingPipelineCreateInfoNV`, specifying how a pipeline is created, are:

```
typedef enum VkPipelineCreateFlagBits {
    VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT = 0x00000001,
    VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT = 0x00000002,
    VK_PIPELINE_CREATE_DERIVATIVE_BIT = 0x00000004,
    VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT = 0x00000008,
    VK_PIPELINE_CREATE_DISPATCH_BASE_BIT = 0x00000010,
    VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV = 0x00000020,
    VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR = 0x00000040,
    VK_PIPELINE_CREATE_CAPTURE_INTERNAL REPRESENTATIONS_BIT_KHR = 0x00000080,
    VK_PIPELINE_CREATE_DISPATCH_BASE = VK_PIPELINE_CREATE_DISPATCH_BASE_BIT,
    VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT_KHR =
VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT,
    VK_PIPELINE_CREATE_DISPATCH_BASE_KHR = VK_PIPELINE_CREATE_DISPATCH_BASE,
    VK_PIPELINE_CREATE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkPipelineCreateFlagBits;
```

- `VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT` specifies that the created pipeline will not be

optimized. Using this flag **may** reduce the time taken to create the pipeline.

- **VK\_PIPELINE\_CREATE\_ALLOW\_DERIVATIVES\_BIT** specifies that the pipeline to be created is allowed to be the parent of a pipeline that will be created in a subsequent call to [vkCreateGraphicsPipelines](#) or [vkCreateComputePipelines](#).
- **VK\_PIPELINE\_CREATE\_DERIVATIVE\_BIT** specifies that the pipeline to be created will be a child of a previously created parent pipeline.
- **VK\_PIPELINE\_CREATE\_VIEW\_INDEX\_FROM\_DEVICE\_INDEX\_BIT** specifies that any shader input variables decorated as *ViewIndex* will be assigned values as if they were decorated as *DeviceIndex*.
- **VK\_PIPELINE\_CREATE\_DISPATCH\_BASE** specifies that a compute pipeline **can** be used with [vkCmdDispatchBase](#) with a non-zero base workgroup.
- **VK\_PIPELINE\_CREATE\_DEFER\_COMPILE\_BIT\_NV** specifies that a pipeline is created with all shaders in the deferred state. Before using the pipeline the application **must** call [vkCompileDeferredNV](#) exactly once on each shader in the pipeline before using the pipeline.
- **VK\_PIPELINE\_CREATE\_CAPTURE\_STATISTICS\_BIT\_KHR** specifies that the shader compiler should capture statistics for the executables produced by the compile process which **can** later be retrieved by calling [vkGetPipelineExecutableStatisticsKHR](#). Enabling this flag **must** not affect the final compiled pipeline but **may** disable pipeline caching or otherwise affect pipeline creation time.
- **VK\_PIPELINE\_CREATE\_CAPTURE\_INTERNAL REPRESENTATIONS\_BIT\_KHR** specifies that the shader compiler should capture the internal representations of executables produced by the compile process which **can** later be retrieved by calling [vkGetPipelineExecutableInternalRepresentationsKHR](#). Enabling this flag **must** not affect the final compiled pipeline but **may** disable pipeline caching or otherwise affect pipeline creation time.

It is valid to set both **VK\_PIPELINE\_CREATE\_ALLOW\_DERIVATIVES\_BIT** and **VK\_PIPELINE\_CREATE\_DERIVATIVE\_BIT**. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See [Pipeline Derivatives](#) for more information.

```
typedef VkFlags VkPipelineCreateFlags;
```

`VkPipelineCreateFlags` is a bitmask type for setting a mask of zero or more [VkPipelineCreateFlagBits](#).

The `VkPipelineDynamicStateCreateInfo` structure is defined as:

```
typedef struct VkPipelineDynamicStateCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineDynamicStateCreateFlags flags;
    uint32_t                  dynamicStateCount;
    const VkDynamicState*     pDynamicStates;
} VkPipelineDynamicStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is reserved for future use.
- `dynamicStateCount` is the number of elements in the `pDynamicStates` array.
- `pDynamicStates` is a pointer to an array of `VkDynamicState` values specifying which pieces of pipeline state will use the values from dynamic state commands rather than from pipeline state creation info.

### Valid Usage

- Each element of `pDynamicStates` **must** be unique

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_DYNAMIC_STATE_CREATE_INFO`
- `pNext` **must** be `NULL`
- `flags` **must** be `0`
- If `dynamicStateCount` is not `0`, `pDynamicStates` **must** be a valid pointer to an array of `dynamicStateCount` valid `VkDynamicState` values

```
typedef VkFlags VkPipelineDynamicStateCreateInfo;
```

`VkPipelineDynamicStateCreateInfo` is a bitmask type for setting a mask, but is currently reserved for future use.

The source of different pieces of dynamic state is specified by the `VkPipelineDynamicStateCreateInfo::pDynamicStates` property of the currently active pipeline, each of whose elements **must** be one of the values:

```

typedef enum VkDynamicState {
    VK_DYNAMIC_STATE_VIEWPORT = 0,
    VK_DYNAMIC_STATE_SCISSOR = 1,
    VK_DYNAMIC_STATE_LINE_WIDTH = 2,
    VK_DYNAMIC_STATE_DEPTH_BIAS = 3,
    VK_DYNAMIC_STATE_BLEND_CONSTANTS = 4,
    VK_DYNAMIC_STATE_DEPTH_BOUNDS = 5,
    VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK = 6,
    VK_DYNAMIC_STATE_STENCIL_WRITE_MASK = 7,
    VK_DYNAMIC_STATE_STENCIL_REFERENCE = 8,
    VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV = 1000087000,
    VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT = 1000099000,
    VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT = 1000143000,
    VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV = 1000164004,
    VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV = 1000164006,
    VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV = 1000205001,
    VK_DYNAMIC_STATE_LINE_STIPPLE_EXT = 1000259000,
    VK_DYNAMIC_STATE_MAX_ENUM = 0x7FFFFFFF
} VkDynamicState;

```

- `VK_DYNAMIC_STATE_VIEWPORT` specifies that the `pViewports` state in `VkPipelineViewportStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetViewport` before any draw commands. The number of viewports used by a pipeline is still specified by the `viewportCount` member of `VkPipelineViewportStateCreateInfo`.
- `VK_DYNAMIC_STATE_SCISSOR` specifies that the `pScissors` state in `VkPipelineViewportStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetScissor` before any draw commands. The number of scissor rectangles used by a pipeline is still specified by the `scissorCount` member of `VkPipelineViewportStateCreateInfo`.
- `VK_DYNAMIC_STATE_LINE_WIDTH` specifies that the `lineWidth` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetLineWidth` before any draw commands that generate line primitives for the rasterizer.
- `VK_DYNAMIC_STATE_DEPTH_BIAS` specifies that the `depthBiasConstantFactor`, `depthBiasClamp` and `depthBiasSlopeFactor` states in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthBias` before any draws are performed with `depthBiasEnable` in `VkPipelineRasterizationStateCreateInfo` set to `VK_TRUE`.
- `VK_DYNAMIC_STATE_BLEND_CONSTANTS` specifies that the `blendConstants` state in `VkPipelineColorBlendStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetBlendConstants` before any draws are performed with a pipeline state with `VkPipelineColorBlendAttachmentState` member `blendEnable` set to `VK_TRUE` and any of the blend functions using a constant blend color.
- `VK_DYNAMIC_STATE_DEPTH_BOUNDS` specifies that the `minDepthBounds` and `maxDepthBounds` states of `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthBounds` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `depthBoundsTestEnable` set to `VK_TRUE`.

- **VK\_DYNAMIC\_STATE\_STENCIL\_COMPARE\_MASK** specifies that the `compareMask` state in `VkPipelineDepthStencilStateCreateInfo` for both `front` and `back` will be ignored and **must** be set dynamically with `vkCmdSetStencilCompareMask` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to `VK_TRUE`
- **VK\_DYNAMIC\_STATE\_STENCIL\_WRITE\_MASK** specifies that the `writeMask` state in `VkPipelineDepthStencilStateCreateInfo` for both `front` and `back` will be ignored and **must** be set dynamically with `vkCmdSetStencilWriteMask` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to `VK_TRUE`
- **VK\_DYNAMIC\_STATE\_STENCIL\_REFERENCE** specifies that the `reference` state in `VkPipelineDepthStencilStateCreateInfo` for both `front` and `back` will be ignored and **must** be set dynamically with `vkCmdSetStencilReference` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to `VK_TRUE`
- **VK\_DYNAMIC\_STATE\_VIEWPORT\_W\_SCALING\_NV** specifies that the `pViewportScalings` state in `VkPipelineViewportWScalingStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetViewportWScalingNV` before any draws are performed with a pipeline state with `VkPipelineViewportWScalingStateCreateInfoNV` member `viewportScalingEnable` set to `VK_TRUE`
- **VK\_DYNAMIC\_STATE\_DISCARD\_RECTANGLE\_EXT** specifies that the `pDiscardRectangles` state in `VkPipelineDiscardRectangleStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetDiscardRectangleEXT` before any draw or clear commands. The `VkDiscardRectangleModeEXT` and the number of active discard rectangles is still specified by the `discardRectangleMode` and `discardRectangleCount` members of `VkPipelineDiscardRectangleStateCreateInfoEXT`.
- **VK\_DYNAMIC\_STATE\_SAMPLE\_LOCATIONS\_EXT** specifies that the `sampleLocationsInfo` state in `VkPipelineSampleLocationsStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetSampleLocationsEXT` before any draw or clear commands. Enabling custom sample locations is still indicated by the `sampleLocationsEnable` member of `VkPipelineSampleLocationsStateCreateInfoEXT`.
- **VK\_DYNAMIC\_STATE\_EXCLUSIVE\_SCISSOR\_NV** specifies that the `pExclusiveScissors` state in `VkPipelineViewportExclusiveScissorStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetExclusiveScissorNV` before any draw commands. The number of exclusive scissor rectangles used by a pipeline is still specified by the `exclusiveScissorCount` member of `VkPipelineViewportExclusiveScissorStateCreateInfoNV`.
- **VK\_DYNAMIC\_STATE\_VIEWPORT\_SHADING\_RATE\_PALETTE\_NV** specifies that the `pShadingRatePalettes` state in `VkPipelineViewportShadingRateImageStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetViewportShadingRatePaletteNV` before any draw commands.
- **VK\_DYNAMIC\_STATE\_VIEWPORT\_COARSE\_SAMPLE\_ORDER\_NV** specifies that the coarse sample order state in `VkPipelineViewportCoarseSampleOrderStateCreateInfoNV` will be ignored and **must** be set dynamically with `vkCmdSetCoarseSampleOrderNV` before any draw commands.
- **VK\_DYNAMIC\_STATE\_LINE\_STIPPLE\_EXT** specifies that the `lineStippleFactor` and `lineStipplePattern` state in `VkPipelineRasterizationLineStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetLineStippleEXT` before any draws are performed with a pipeline state with `VkPipelineRasterizationLineStateCreateInfoEXT` member `stippledLineEnable` set to `VK_TRUE`.

### 9.2.1. Valid Combinations of Stages for Graphics Pipelines

The geometric primitive processing can either be handled on a per primitive basis by the vertex, tessellation, and geometry shader stages, or on a per mesh basis using task and mesh shader stages. If the pipeline includes a mesh shader stage, it uses the mesh pipeline, otherwise it uses the primitive pipeline.

If a task shader is omitted, the task shading stage is skipped.

If tessellation shader stages are omitted, the tessellation shading and fixed-function stages of the pipeline are skipped.

If a geometry shader is omitted, the geometry shading stage is skipped.

If a fragment shader is omitted, fragment color outputs have undefined values, and the fragment depth value is unmodified. This **can** be useful for depth-only rendering.

Presence of a shader stage in a pipeline is indicated by including a valid [VkPipelineShaderCreateInfo](#) with `module` and `pName` selecting an entry point from a shader module, where that entry point is valid for the stage specified by `stage`.

Presence of some of the fixed-function stages in the pipeline is implicitly derived from enabled shaders and provided state. For example, the fixed-function tessellator is always present when the pipeline has valid Tessellation Control and Tessellation Evaluation shaders.

*For example:*

- Depth/stencil-only rendering in a subpass with no color attachments
  - Active Pipeline Shader Stages
    - Vertex Shader
  - Required: Fixed-Function Pipeline Stages
    - [VkPipelineVertexInputStateCreateInfo](#)
    - [VkPipelineAssemblyStateCreateInfo](#)
    - [VkPipelineViewportStateCreateInfo](#)
    - [VkPipelineRasterizationStateCreateInfo](#)
    - [VkPipelineMultisampleStateCreateInfo](#)
    - [VkPipelineDepthStencilStateCreateInfo](#)
- Color-only rendering in a subpass with no depth/stencil attachment
  - Active Pipeline Shader Stages
    - Vertex Shader
    - Fragment Shader
  - Required: Fixed-Function Pipeline Stages
    - [VkPipelineVertexInputStateCreateInfo](#)
    - [VkPipelineAssemblyStateCreateInfo](#)

- [VkPipelineViewportStateCreateInfo](#)
- [VkPipelineRasterizationStateCreateInfo](#)
- [VkPipelineMultisampleStateCreateInfo](#)
- [VkPipelineColorBlendStateCreateInfo](#)
- Rendering pipeline with tessellation and geometry shaders
  - Active Pipeline Shader Stages
    - Vertex Shader
    - Tessellation Control Shader
    - Tessellation Evaluation Shader
    - Geometry Shader
    - Fragment Shader
  - Required: Fixed-Function Pipeline Stages
    - [VkPipelineVertexInputStateCreateInfo](#)
    - [VkPipelineInputAssemblyStateCreateInfo](#)
    - [VkPipelineTessellationStateCreateInfo](#)
    - [VkPipelineViewportStateCreateInfo](#)
    - [VkPipelineRasterizationStateCreateInfo](#)
    - [VkPipelineMultisampleStateCreateInfo](#)
    - [VkPipelineDepthStencilStateCreateInfo](#)
    - [VkPipelineColorBlendStateCreateInfo](#)
- Rendering pipeline with task and mesh shaders
  - Active Pipeline Shader Stages
    - Task Shader
    - Mesh Shader
    - Fragment Shader
  - Required: Fixed-Function Pipeline Stages
    - [VkPipelineViewportStateCreateInfo](#)
    - [VkPipelineRasterizationStateCreateInfo](#)
    - [VkPipelineMultisampleStateCreateInfo](#)
    - [VkPipelineDepthStencilStateCreateInfo](#)
    - [VkPipelineColorBlendStateCreateInfo](#)

## 9.3. Pipeline destruction

To destroy a graphics or compute pipeline, call:

```
void vkDestroyPipeline(  
    VkDevice device,  
    VkPipeline pipeline,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the pipeline.
- `pipeline` is the handle of the pipeline to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

### Valid Usage

- All submitted commands that refer to `pipeline` **must** have completed execution
- If `VkAllocationCallbacks` were provided when `pipeline` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `pipeline` was created, `pAllocator` **must** be `NULL`

### Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `pipeline` is not `VK_NULL_HANDLE`, `pipeline` **must** be a valid `VkPipeline` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `pipeline` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `pipeline` **must** be externally synchronized

## 9.4. Multiple Pipeline Creation

Multiple pipelines **can** be created simultaneously by passing an array of `VkGraphicsPipelineCreateInfo` or `VkComputePipelineCreateInfo` structures into the `vkCreateGraphicsPipelines` and `vkCreateComputePipelines` commands, respectively. Applications **can** group together similar pipelines to be created in a single call, and implementations are encouraged to look for reuse opportunities within a group-create.

When an application attempts to create many pipelines in a single command, it is possible that some subset **may** fail creation. In that case, the corresponding entries in the `pPipelines` output array will be filled with `VK_NULL_HANDLE` values. If any pipeline fails creation (for example, due to out of memory errors), the `vkCreate*Pipelines` commands will return an error code. The

implementation will attempt to create all pipelines, and only return `VK_NULL_HANDLE` values for those that actually failed.

## 9.5. Pipeline Derivatives

A pipeline derivative is a child pipeline created from a parent pipeline, where the child and parent are expected to have much commonality. The goal of derivative pipelines is that they be cheaper to create using the parent as a starting point, and that it be more efficient (on either host or device) to switch/bind between children of the same parent.

A derivative pipeline is created by setting the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag in the `VkPipelineCreateInfo` structure. If this is set, then exactly one of `basePipelineHandle` or `basePipelineIndex` members of the structure **must** have a valid handle/index, and specifies the parent pipeline. If `basePipelineHandle` is used, the parent pipeline **must** have already been created. If `basePipelineIndex` is used, then the parent is being created in the same command. `VK_NULL_HANDLE` acts as the invalid handle for `basePipelineHandle`, and -1 is the invalid index for `basePipelineIndex`. If `basePipelineIndex` is used, the base pipeline **must** appear earlier in the array. The base pipeline **must** have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set.

## 9.6. Pipeline Cache

Pipeline cache objects allow the result of pipeline construction to be reused between pipelines and between runs of an application. Reuse between pipelines is achieved by passing the same pipeline cache object when creating multiple related pipelines. Reuse across runs of an application is achieved by retrieving pipeline cache contents in one run of an application, saving the contents, and using them to preinitialize a pipeline cache on a subsequent run. The contents of the pipeline cache objects are managed by the implementation. Applications **can** manage the host memory consumed by a pipeline cache object and control the amount of data retrieved from a pipeline cache object.

Pipeline cache objects are represented by `VkPipelineCache` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineCache)
```

To create pipeline cache objects, call:

```
VkResult vkCreatePipelineCache(  
    VkDevice                                     device,  
    const VkPipelineCacheCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks*     pAllocator,  
    VkPipelineCache*                pPipelineCache);
```

- `device` is the logical device that creates the pipeline cache object.
- `pCreateInfo` is a pointer to a `VkPipelineCacheCreateInfo` structure containing initial parameters for the pipeline cache object.

- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pPipelineCache` is a pointer to a `VkPipelineCache` handle in which the resulting pipeline cache object is returned.

*Note*

Applications **can** track and manage the total host memory size of a pipeline cache object using the `pAllocator`. Applications **can** limit the amount of data retrieved from a pipeline cache object in `vkGetPipelineCacheData`. Implementations **should** not internally limit the total number of entries added to a pipeline cache object or the total host memory consumed.

Once created, a pipeline cache **can** be passed to the `vkCreateGraphicsPipelines` and `vkCreateComputePipelines` commands. If the pipeline cache passed into these commands is not `VK_NULL_HANDLE`, the implementation will query it for possible reuse opportunities and update it with new content. The use of the pipeline cache object in these commands is internally synchronized, and the same pipeline cache object **can** be used in multiple threads simultaneously.

*Note*

Implementations **should** make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the duration of the `vkCreateGraphicsPipelines` and `vkCreateComputePipelines` commands.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkPipelineCacheCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pPipelineCache` **must** be a valid pointer to a `VkPipelineCache` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineCacheCreateInfo` structure is defined as:

```
typedef struct VkPipelineCacheCreateInfo {
    VkStructureType           sType;
    const void*                pNext;
    VkPipelineCacheCreateFlags flags;
    size_t                     initialDataSize;
    const void*                pInitialData;
} VkPipelineCacheCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is reserved for future use.
- `initialDataSize` is the number of bytes in `pInitialData`. If `initialDataSize` is zero, the pipeline cache will initially be empty.
- `pInitialData` is a pointer to previously retrieved pipeline cache data. If the pipeline cache data is incompatible (as defined below) with the device, the pipeline cache will be initially empty. If `initialDataSize` is zero, `pInitialData` is ignored.

## Valid Usage

- If `initialDataSize` is not `0`, it **must** be equal to the size of `pInitialData`, as returned by `vkGetPipelineCacheData` when `pInitialData` was originally retrieved
- If `initialDataSize` is not `0`, `pInitialData` **must** have been retrieved from a previous call to `vkGetPipelineCacheData`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_CACHE_CREATE_INFO`
- `pNext` **must** be `NULL`
- `flags` **must** be `0`
- If `initialDataSize` is not `0`, `pInitialData` **must** be a valid pointer to an array of `initialDataSize` bytes

```
typedef VkFlags VkPipelineCacheCreateFlags;
```

`VkPipelineCacheCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

Pipeline cache objects **can** be merged using the command:

```
VkResult vkMergePipelineCaches(  
    VkDevice device,  
    VkPipelineCache dstCache,  
    uint32_t srcCacheCount,  
    const VkPipelineCache* pSrcCaches);
```

- `device` is the logical device that owns the pipeline cache objects.
- `dstCache` is the handle of the pipeline cache to merge results into.
- `srcCacheCount` is the length of the `pSrcCaches` array.
- `pSrcCaches` is a pointer to an array of pipeline cache handles, which will be merged into `dstCache`. The previous contents of `dstCache` are included after the merge.

*Note*

The details of the merge operation are implementation dependent, but implementations **should** merge the contents of the specified pipelines and prune duplicate entries.

## Valid Usage

- `dstCache` **must** not appear in the list of source caches

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `dstCache` **must** be a valid `VkPipelineCache` handle
- `pSrcCaches` **must** be a valid pointer to an array of `srcCacheCount` valid `VkPipelineCache` handles
- `srcCacheCount` **must** be greater than `0`
- `dstCache` **must** have been created, allocated, or retrieved from `device`
- Each element of `pSrcCaches` **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `dstCache` **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Data **can** be retrieved from a pipeline cache object using the command:

```
VkResult vkGetPipelineCacheData(  
    VkDevice device,  
    VkPipelineCache pipelineCache,  
    size_t* pDatasize,  
    void* pData);
```

- `device` is the logical device that owns the pipeline cache.
- `pipelineCache` is the pipeline cache to retrieve data from.
- `pDatasize` is a pointer to a `size_t` value related to the amount of data in the pipeline cache, as described below.
- `pData` is either `NULL` or a pointer to a buffer.

If `pData` is `NULL`, then the maximum size of the data that **can** be retrieved from the pipeline cache, in bytes, is returned in `pDatasize`. Otherwise, `pDatasize` **must** point to a variable set by the user to the size of the buffer, in bytes, pointed to by `pData`, and on return the variable is overwritten with the amount of data actually written to `pData`.

If `pDatasize` is less than the maximum size that **can** be retrieved by the pipeline cache, at most `pDatasize` bytes will be written to `pData`, and `vkGetPipelineCacheData` will return `VK_INCOMPLETE`. Any data written to `pData` is valid and **can** be provided as the `pInitialData` member of the `VkPipelineCacheCreateInfo` structure passed to `vkCreatePipelineCache`.

Two calls to `vkGetPipelineCacheData` with the same parameters **must** retrieve the same data unless a command that modifies the contents of the cache is called between them.

Applications **can** store the data retrieved from the pipeline cache, and use these data, possibly in a future run of the application, to populate new pipeline cache objects. The results of pipeline compiles, however, **may** depend on the vendor ID, device ID, driver version, and other details of the device. To enable applications to detect when previously retrieved data is incompatible with the device, the initial bytes written to `pData` **must** be a header consisting of the following members:

*Table 12. Layout for pipeline cache header version `VK_PIPELINE_CACHE_HEADER_VERSION_ONE`*

Offset	Size	Meaning
0	4	length in bytes of the entire pipeline cache header written as a stream of bytes, with the least significant byte first
4	4	a <code>VkPipelineCacheHeaderVersion</code> value written as a stream of bytes, with the least significant byte first
8	4	a vendor ID equal to <code>VkPhysicalDeviceProperties::vendorID</code> written as a stream of bytes, with the least significant byte first
12	4	a device ID equal to <code>VkPhysicalDeviceProperties::deviceID</code> written as a stream of bytes, with the least significant byte first
16	<code>VK_UUID_SIZE</code>	a pipeline cache ID equal to <code>VkPhysicalDeviceProperties::pipelineCacheUUID</code>

The first four bytes encode the length of the entire pipeline cache header, in bytes. This value includes all fields in the header including the pipeline cache version field and the size of the length field.

The next four bytes encode the pipeline cache version, as described for `VkPipelineCacheHeaderVersion`. A consumer of the pipeline cache **should** use the cache version to interpret the remainder of the cache header.

If `pDataSize` is less than what is necessary to store this header, nothing will be written to `pData` and zero will be written to `pDataSize`.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pipelineCache` **must** be a valid `VkPipelineCache` handle
- `pDataSize` **must** be a valid pointer to a `size_t` value
- If the value referenced by `pDataSize` is not `0`, and `pData` is not `NULL`, `pData` **must** be a valid pointer to an array of `pDataSize` bytes
- `pipelineCache` **must** have been created, allocated, or retrieved from `device`

## Return Codes

### Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Possible values of the second group of four bytes in the header returned by `vkGetPipelineCacheData`, encoding the pipeline cache version, are:

```
typedef enum VkPipelineCacheHeaderVersion {
    VK_PIPELINE_CACHE_HEADER_VERSION_ONE = 1,
    VK_PIPELINE_CACHE_HEADER_VERSION_MAX_ENUM = 0x7FFFFFFF
} VkPipelineCacheHeaderVersion;
```

- `VK_PIPELINE_CACHE_HEADER_VERSION_ONE` specifies version one of the pipeline cache.

To destroy a pipeline cache, call:

```
void vkDestroyPipelineCache(
    VkDevice                                     device,
    VkPipelineCache                             pipelineCache,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the pipeline cache object.
- `pipelineCache` is the handle of the pipeline cache to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- If `VkAllocationCallbacks` were provided when `pipelineCache` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `pipelineCache` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` **must** be a valid `VkPipelineCache` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `pipelineCache` **must** be externally synchronized

## 9.7. Specialization Constants

Specialization constants are a mechanism whereby constants in a SPIR-V module **can** have their constant value specified at the time the `VkPipeline` is created. This allows a SPIR-V module to have constants that **can** be modified while executing an application that uses the Vulkan API.

*Note*

Specialization constants are useful to allow a compute shader to have its local workgroup size changed at runtime by the user, for example.

Each instance of the `VkPipelineShaderStageCreateInfo` structure contains a parameter `pSpecializationInfo`, which **can** be `NULL` to indicate no specialization constants, or point to a `VkSpecializationInfo` structure.

The `VkSpecializationInfo` structure is defined as:

```
typedef struct VkSpecializationInfo {
    uint32_t                         mapEntryCount;
    const VkSpecializationMapEntry*   pMapEntries;
    size_t                            dataSize;
    const void*                       pData;
} VkSpecializationInfo;
```

- `mapEntryCount` is the number of entries in the `pMapEntries` array.
- `pMapEntries` is a pointer to an array of `VkSpecializationMapEntry` structures which map constant IDs to offsets in `pData`.
- `dataSize` is the byte size of the `pData` buffer.
- `pData` contains the actual constant values to specialize with.

`pMapEntries` is a pointer to a `VkSpecializationMapEntry` structure.

### Valid Usage

- The `offset` member of each element of `pMapEntries` **must** be less than `dataSize`
- The `size` member of each element of `pMapEntries` **must** be less than or equal to `dataSize` minus `offset`

### Valid Usage (Implicit)

- If `mapEntryCount` is not `0`, `pMapEntries` **must** be a valid pointer to an array of `mapEntryCount` valid `VkSpecializationMapEntry` structures
- If `dataSize` is not `0`, `pData` **must** be a valid pointer to an array of `dataSize` bytes

The `VkSpecializationMapEntry` structure is defined as:

```
typedef struct VkSpecializationMapEntry {
    uint32_t constantID;
    uint32_t offset;
    size_t size;
} VkSpecializationMapEntry;
```

- `constantID` is the ID of the specialization constant in SPIR-V.
- `offset` is the byte offset of the specialization constant value within the supplied data buffer.
- `size` is the byte size of the specialization constant value within the supplied data buffer.

If a `constantID` value is not a specialization constant ID used in the shader, that map entry does not affect the behavior of the pipeline.

## Valid Usage

- For a `constantID` specialization constant declared in a shader, `size` **must** match the byte size of the `constantID`. If the specialization constant is of type `boolean`, `size` **must** be the byte size of `VkBool32`

In human readable SPIR-V:

```
OpDecorate %x SpecId 13 ; decorate .x component of WorkgroupSize with ID 13
OpDecorate %y SpecId 42 ; decorate .y component of WorkgroupSize with ID 42
OpDecorate %z SpecId 3 ; decorate .z component of WorkgroupSize with ID 3
OpDecorate %wgsiz3 BuiltIn WorkgroupSize ; decorate WorkgroupSize onto constant
%i32 = OpTypeInt 32 0 ; declare an unsigned 32-bit type
%uvec3 = OpTypeVector %i32 3 ; declare a 3 element vector type of unsigned 32-bit
%x = OpSpecConstant %i32 1 ; declare the .x component of WorkgroupSize
%y = OpSpecConstant %i32 1 ; declare the .y component of WorkgroupSize
%z = OpSpecConstant %i32 1 ; declare the .z component of WorkgroupSize
%wgsiz3 = OpSpecConstantComposite %uvec3 %x %y %z ; declare WorkgroupSize
```

From the above we have three specialization constants, one for each of the x, y & z elements of the WorkgroupSize vector.

Now to specialize the above via the specialization constants mechanism:

```

const VkSpecializationMapEntry entries[] =
{
{
    13,                                // constantID
    0 * sizeof(uint32_t),           // offset
    sizeof(uint32_t)                  // size
},
{
    42,                                // constantID
    1 * sizeof(uint32_t),           // offset
    sizeof(uint32_t)                  // size
},
{
    3,                                // constantID
    2 * sizeof(uint32_t),           // offset
    sizeof(uint32_t)                  // size
}
};

const uint32_t data[] = { 16, 8, 4 }; // our workgroup size is 16x8x4

const VkSpecializationInfo info =
{
    3,                                // mapEntryCount
    entries,                            // pMapEntries
    3 * sizeof(uint32_t),           // dataSize
    data,                               // pData
};

```

Then when calling `vkCreateComputePipelines`, and passing the `VkSpecializationInfo` we defined as the `pSpecializationInfo` parameter of `VkPipelineShaderStageCreateInfo`, we will create a compute pipeline with the runtime specified local workgroup size.

Another example would be that an application has a SPIR-V module that has some platform-dependent constants they wish to use.

In human readable SPIR-V:

```

OpDecorate %1 SpecId 0 ; decorate our signed 32-bit integer constant
OpDecorate %2 SpecId 12 ; decorate our 32-bit floating-point constant
%i32 = OpTypeInt 32 1 ; declare a signed 32-bit type
%float = OpTypeFloat 32 ; declare a 32-bit floating-point type
%1 = OpSpecConstant %i32 -1 ; some signed 32-bit integer constant
%2 = OpSpecConstant %float 0.5 ; some 32-bit floating-point constant

```

From the above we have two specialization constants, one is a signed 32-bit integer and the second is a 32-bit floating-point.

Now to specialize the above via the specialization constants mechanism:

```
struct SpecializationData {
    int32_t data0;
    float data1;
};

const VkSpecializationMapEntry entries[] =
{
{
    0,                                // constantID
    offsetof(SpecializationData, data0), // offset
    sizeof(SpecializationData::data0)   // size
},
{
    12,                               // constantID
    offsetof(SpecializationData, data1), // offset
    sizeof(SpecializationData::data1)   // size
}
};

SpecializationData data;
data.data0 = -42;      // set the data for the 32-bit integer
data.data1 = 42.0f;    // set the data for the 32-bit floating-point

const VkSpecializationInfo info =
{
    2,                                // mapEntryCount
    entries,                           // pMapEntries
    sizeof(data),                      // dataSize
    &data,                            // pData
};
```

It is legal for a SPIR-V module with specializations to be compiled into a pipeline where no specialization info was provided. SPIR-V specialization constants contain default values such that if a specialization is not provided, the default value will be used. In the examples above, it would be valid for an application to only specialize some of the specialization constants within the SPIR-V module, and let the other constants use their default values encoded within the OpSpecConstant declarations.

## 9.8. Pipeline Binding

Once a pipeline has been created, it **can** be bound to the command buffer using the command:

```
void vkCmdBindPipeline(  
    VkCommandBuffer  
    pipelineBindPoint  
    VkPipeline  
    pipeline);
```

- `commandBuffer` is the command buffer that the pipeline will be bound to.
- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying whether to bind to the compute or graphics bind point. Binding one does not disturb the other.
- `pipeline` is the pipeline to be bound.

Once bound, a pipeline binding affects subsequent graphics or compute commands in the command buffer until a different pipeline is bound to the bind point. The pipeline bound to `VK_PIPELINE_BIND_POINT_COMPUTE` controls the behavior of `vkCmdDispatch` and `vkCmdDispatchIndirect`. The pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` controls the behavior of all drawing commands. The pipeline bound to `VK_PIPELINE_BIND_POINT_RAY_TRACING_NV` controls the behavior of `vkCmdTraceRaysNV`. No other commands are affected by the pipeline state.

## Valid Usage

- If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE`, `pipeline` **must** be a compute pipeline
- If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, `pipeline` **must** be a graphics pipeline
- If the `variable multisample rate` feature is not supported, `pipeline` is a graphics pipeline, the current subpass has no attachments, and this is not the first call to this function with a graphics pipeline after transitioning to the current subpass, then the sample count specified by this pipeline **must** match that set in the previous pipeline
- If `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE`, and `pipeline` is a graphics pipeline created with a `VkPipelineSampleLocationsStateCreateInfoEXT` structure having its `sampleLocationsEnable` member set to `VK_TRUE` but without `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` enabled then the current render pass instance **must** have been begun by specifying a `VkRenderPassSampleLocationsBeginInfoEXT` structure whose `pPostSubpassSampleLocations` member contains an element with a `subpassIndex` matching the current subpass index and the `sampleLocationsInfo` member of that element **must** match the `sampleLocationsInfo` specified in `VkPipelineSampleLocationsStateCreateInfoEXT` when the pipeline was created
- This command **must** not be recorded when transform feedback is active
- If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_NV`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_NV`, the `pipeline` **must** be a ray tracing pipeline

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value
- `pipeline` **must** be a valid `VkPipeline` handle
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- Both of `commandBuffer`, and `pipeline` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Graphics Compute	

Possible values of `vkCmdBindPipeline::pipelineBindPoint`, specifying the bind point of a pipeline object, are:

```
typedef enum VkPipelineBindPoint {
    VK_PIPELINE_BIND_POINT_GRAPHICS = 0,
    VK_PIPELINE_BIND_POINT_COMPUTE = 1,
    VK_PIPELINE_BIND_POINT_RAY_TRACING_NV = 1000165000,
    VK_PIPELINE_BIND_POINT_MAX_ENUM = 0x7FFFFFFF
} VkPipelineBindPoint;
```

- `VK_PIPELINE_BIND_POINT_COMPUTE` specifies binding as a compute pipeline.
- `VK_PIPELINE_BIND_POINT_GRAPHICS` specifies binding as a graphics pipeline.
- `VK_PIPELINE_BIND_POINT_RAY_TRACING_NV` specifies binding as a ray tracing pipeline.

## 9.9. Dynamic State

When a pipeline object is bound, any pipeline object state that is not specified as dynamic is applied to the command buffer state. Pipeline object state that is specified as dynamic is not applied to the command buffer state at this time. Instead, dynamic state **can** be modified at any time and persists for the lifetime of the command buffer, or until modified by another dynamic state setting command or another pipeline bind.

When a pipeline object is bound, the following applies to each state parameter:

- If the state is not specified as dynamic in the new pipeline object, then that command buffer state is overwritten by the state in the new pipeline object.
- If the state is specified as dynamic in both the new and the previous pipeline object, then that command buffer state is not disturbed.
- If the state is specified as dynamic in the new pipeline object but is not specified as dynamic in the previous pipeline object, then that command buffer state becomes undefined. If the state is

an array, then the entire array becomes undefined.

- If the state is an array specified as dynamic in both the new and the previous pipeline object, and the array size is not the same in both pipeline objects, then that command buffer state becomes undefined.

Dynamic state setting commands **must** not be issued for state that is not specified as dynamic in the bound pipeline object.

Dynamic state that does not affect the result of operations **can** be left undefined.

*Note*

For example, if blending is disabled by the pipeline object state then the dynamic color blend constants do not need to be specified in the command buffer, even if this state is specified as dynamic in the pipeline object.

## 9.10. Pipeline Shader Information

When a pipeline is created, its state and shaders are compiled into zero or more device-specific executables, which are used when executing commands against that pipeline. To query the properties of these executables, call:

```
VkResult vkGetPipelineExecutablePropertiesKHR(  
    VkDevice                                     device,  
    const VkPipelineInfoKHR*                      pPipelineInfo,  
    uint32_t*                                     pExecutableCount,  
    VkPipelineExecutablePropertiesKHR*            pProperties);
```

- `device` is the device that created the pipeline.
- `pPipelineInfo` describes the pipeline being queried.
- `pExecutableCount` is a pointer to an integer related to the number of pipeline executables available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkPipelineExecutablePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of executables associated with the pipeline is returned in `pExecutableCount`. Otherwise, `pExecutableCount` **must** point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pExecutableCount` is less than the number of executables associated with the pipeline, at most `pExecutableCount` structures will be written and `vkGetPipelineExecutablePropertiesKHR` will return `VK_INCOMPLETE`.

## Valid Usage

- `pipelineExecutableInfo` **must** be enabled.
- `pipeline` member of `pPipelineInfo` **must** have been created with `device`.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pPipelineInfo` **must** be a valid pointer to a valid `VkPipelineInfoKHR` structure
- `pExecutableCount` **must** be a valid pointer to a `uint32_t` value
- If the value referenced by `pExecutableCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pExecutableCount` `VkPipelineExecutablePropertiesKHR` structures

## Return Codes

### Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineInfoKHR` structure is defined as:

```
typedef struct VkPipelineInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkPipeline         pipeline;
} VkPipelineInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `pipeline` is a `VkPipeline` handle.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_INFO_KHR`
- `pNext` must be `NULL`
- `pipeline` must be a valid `VkPipeline` handle

The `VkPipelineExecutablePropertiesKHR` structure is defined as:

```
typedef struct VkPipelineExecutablePropertiesKHR {
    VkStructureType      sType;
    void*                pNext;
    VkShaderStageFlags   stages;
    char                 name[VK_MAX_DESCRIPTION_SIZE];
    char                 description[VK_MAX_DESCRIPTION_SIZE];
    uint32_t              subgroupSize;
} VkPipelineExecutablePropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `stages` is a bitmask of `VkShaderStageFlagBits` indicating which shader stages (if any) were principally used as inputs to compile this pipeline executable.
- `name` is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a short human readable name for this executable.
- `description` is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a human readable description for this executable.
- `subgroupSize` is the subgroup size with which this executable is dispatched.

The `stages` field **may** be zero or it **may** contain one or more bits describing the stages principally used to compile this pipeline. Not all implementations have a 1:1 mapping between shader stages and pipeline executables and some implementations **may** reduce a given shader stage to fixed function hardware programming such that no executable is available. No guarantees are provided about the mapping between shader stages and pipeline executables and `stages` **should** be considered a best effort hint. Because the application **cannot** rely on the `stages` field to provide an exact description, `name` and `description` provide a human readable name and description which more accurately describes the given pipeline executable.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_PROPERTIES_KHR`
- `pNext` must be `NULL`

Each pipeline executable **may** have a set of statistics associated with it that are generated by the

pipeline compilation process. These statistics **may** include things such as instruction counts, amount of spilling (if any), maximum number of simultaneous threads, or anything else which **may** aid developers in evaluating the expected performance of a shader. To query the compile-time statistics associated with a pipeline executable, call:

```
VkResult vkGetPipelineExecutableStatisticsKHR(  
    VkDevice device,  
    const VkPipelineExecutableInfoKHR* pExecutableInfo,  
    uint32_t* pStatisticCount,  
    VkPipelineExecutableStatisticKHR* pStatistics);
```

- `device` is the device that created the pipeline.
- `pExecutableInfo` describes the pipeline executable being queried.
- `pStatisticCount` is a pointer to an integer related to the number of statistics available or queried, as described below.
- `pStatistics` is either `NULL` or a pointer to an array of `VkPipelineExecutableStatisticKHR` structures.

If `pStatistics` is `NULL`, then the number of statistics associated with the pipeline executable is returned in `pStatisticCount`. Otherwise, `pStatisticCount` **must** point to a variable set by the user to the number of elements in the `pStatistics` array, and on return the variable is overwritten with the number of structures actually written to `pStatistics`. If `pStatisticCount` is less than the number of statistics associated with the pipeline executable, at most `pStatisticCount` structures will be written and `vkGetPipelineExecutableStatisticsKHR` will return `VK_INCOMPLETE`.

## Valid Usage

- `pipelineExecutableInfo` **must** be enabled.
- `pipeline` member of `pExecutableInfo` **must** have been created with `device`.
- `pipeline` member of `pExecutableInfo` **must** have been created with `VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR` set in the `flags` field of `VkGraphicsPipelineCreateInfo` or `VkComputePipelineCreateInfo`.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pExecutableInfo` **must** be a valid pointer to a valid `VkPipelineExecutableInfoKHR` structure
- `pStatisticCount` **must** be a valid pointer to a `uint32_t` value
- If the value referenced by `pStatisticCount` is not `0`, and `pStatistics` is not `NULL`, `pStatistics` **must** be a valid pointer to an array of `pStatisticCount` `VkPipelineExecutableStatisticKHR` structures

## Return Codes

### Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineExecutableInfoKHR` structure is defined as:

```
typedef struct VkPipelineExecutableInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkPipeline         pipeline;
    uint32_t           executableIndex;
} VkPipelineExecutableInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `pipeline` is the pipeline to query.
- `executableIndex` is the index of the executable to query in the array of executable properties returned by `vkGetPipelineExecutablePropertiesKHR`.

### Valid Usage

- `executableIndex` **must** be less than the number of executables associated with `pipeline` as returned in the `pExecutableCount` parameter of `vkGetPipelineExecutablePropertiesKHR`.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INFO_KHR`
- `pNext` **must** be `NULL`
- `pipeline` **must** be a valid `VkPipeline` handle

The `VkPipelineExecutableStatisticKHR` structure is defined as:

```

typedef struct VkPipelineExecutableStatisticKHR {
    VkStructureType sType;
    void* pNext;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
    VkPipelineExecutableStatisticFormatKHR format;
    VkPipelineExecutableStatisticValueKHR value;
} VkPipelineExecutableStatisticKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **name** is an array of **VK\_MAX\_DESCRIPTION\_SIZE** **char** containing a null-terminated UTF-8 string which is a short human readable name for this statistic.
- **description** is an array of **VK\_MAX\_DESCRIPTION\_SIZE** **char** containing a null-terminated UTF-8 string which is a human readable description for this statistic.
- **format** is a **VkPipelineExecutableStatisticFormatKHR** value specifying the format of the data found in **value**.
- **value** is the value of this statistic.

## Valid Usage (Implicit)

- **sType** **must** be **VK\_STRUCTURE\_TYPE\_PIPELINE\_EXECUTABLE\_STATISTIC\_KHR**
- **pNext** **must** be **NULL**

The **VkPipelineExecutableStatisticFormatKHR** enum is defined as:

```

typedef enum VkPipelineExecutableStatisticFormatKHR {
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR = 0,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR = 1,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR = 2,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR = 3,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_MAX_ENUM_KHR = 0x7FFFFFFF
} VkPipelineExecutableStatisticFormatKHR;

```

- **VK\_PIPELINE\_EXECUTABLE\_STATISTIC\_FORMAT\_BOOL32\_KHR** specifies that the statistic is returned as a 32-bit boolean value which **must** be either **VK\_TRUE** or **VK\_FALSE** and **should** be read from the **b32** field of **VkPipelineExecutableStatisticValueKHR**.
- **VK\_PIPELINE\_EXECUTABLE\_STATISTIC\_FORMAT\_INT64\_KHR** specifies that the statistic is returned as a signed 64-bit integer and **should** be read from the **i64** field of **VkPipelineExecutableStatisticValueKHR**.
- **VK\_PIPELINE\_EXECUTABLE\_STATISTIC\_FORMAT\_UINT64\_KHR** specifies that the statistic is returned as an unsigned 64-bit integer and **should** be read from the **u64** field of **VkPipelineExecutableStatisticValueKHR**.

- `VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR` specifies that the statistic is returned as a 64-bit floating-point value and **should** be read from the `f64` field of `VkPipelineExecutableStatisticValueKHR`.

The `VkPipelineExecutableStatisticValueKHR` union is defined as:

```
typedef union VkPipelineExecutableStatisticValueKHR {
    VkBool32    b32;
    int64_t     i64;
    uint64_t    u64;
    double      f64;
} VkPipelineExecutableStatisticValueKHR;
```

- `b32` is the 32-bit boolean value if the `VkPipelineExecutableStatisticFormatKHR` is `VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR`.
- `i64` is the signed 64-bit integer value if the `VkPipelineExecutableStatisticFormatKHR` is `VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR`.
- `u64` is the unsigned 64-bit integer value if the `VkPipelineExecutableStatisticFormatKHR` is `VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR`.
- `f64` is the 64-bit floating-point value if the `VkPipelineExecutableStatisticFormatKHR` is `VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR`.

Each pipeline executable **may** have one or more text or binary internal representations associated with it which are generated as part of the compile process. These **may** include the final shader assembly, a binary form of the compiled shader, or the shader compiler's internal representation at any number of intermediate compile steps. To query the internal representations associated with a pipeline executable, call:

```
VkResult vkGetPipelineExecutableInternalRepresentationsKHR(
    VkDevice                                     device,
    const VkPipelineExecutableInfoKHR*          pExecutableInfo,
    uint32_t*                                    pInternalRepresentationCount,
    VkPipelineExecutableInternalRepresentationKHR* pInternalRepresentations);
```

- `device` is the device that created the pipeline.
- `pExecutableInfo` describes the pipeline executable being queried.
- `pInternalRepresentationCount` is a pointer to an integer related to the number of internal representations available or queried, as described below.
- `pInternalRepresentations` is either `NULL` or a pointer to an array of `VkPipelineExecutableInternalRepresentationKHR` structures.

If `pInternalRepresentations` is `NULL`, then the number of internal representations associated with the pipeline executable is returned in `pInternalRepresentationCount`. Otherwise, `pInternalRepresentationCount` **must** point to a variable set by the user to the number of elements in the `pInternalRepresentations` array, and on return the variable is overwritten with the number of

structures actually written to `pInternalRepresentations`. If `pInternalRepresentationCount` is less than the number of internal representations associated with the pipeline executable, at most `pInternalRepresentationCount` structures will be written and `vkGetPipelineExecutableInternalRepresentationsKHR` will return `VK_INCOMPLETE`.

While the details of the internal representations remain implementation dependent, the implementation **should** order the internal representations in the order in which they occur in the compile pipeline with the final shader assembly (if any) last.

## Valid Usage

- `pipelineExecutableInfo` **must** be enabled.
- `pipeline` member of `pExecutableInfo` **must** have been created with `device`.
- `pipeline` member of `pExecutableInfo` **must** have been created with `VK_PIPELINE_CREATE_CAPTURE_INTERNAL REPRESENTATIONS_BIT_KHR` set in the `flags` field of `VkGraphicsPipelineCreateInfo` or `VkComputePipelineCreateInfo`.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pExecutableInfo` **must** be a valid pointer to a valid `VkPipelineExecutableCreateInfoKHR` structure
- `pInternalRepresentationCount` **must** be a valid pointer to a `uint32_t` value
- If the value referenced by `pInternalRepresentationCount` is not `0`, and `pInternalRepresentations` is not `NULL`, `pInternalRepresentations` **must** be a valid pointer to an array of `pInternalRepresentationCount` `VkPipelineExecutableInternalRepresentationKHR` structures

## Return Codes

### Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineExecutableInternalRepresentationKHR` structure is defined as:

```

typedef struct VkPipelineExecutableInternalRepresentationKHR {
    VkStructureType    sType;
    void*           pNext;
    char             name[VK_MAX_DESCRIPTION_SIZE];
    char             description[VK_MAX_DESCRIPTION_SIZE];
    VkBool32        isText;
    size_t          dataSize;
    void*           pData;
} VkPipelineExecutableInternalRepresentationKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **name** is an array of **VK\_MAX\_DESCRIPTION\_SIZE** **char** containing a null-terminated UTF-8 string which is a short human readable name for this internal representation.
- **description** is an array of **VK\_MAX\_DESCRIPTION\_SIZE** **char** containing a null-terminated UTF-8 string which is a human readable description for this internal representation.
- **isText** specifies whether the returned data is text or opaque data. If **isText** is **VK\_TRUE** then the data returned in **pData** is text and is guaranteed to be a null-terminated UTF-8 string.
- **dataSize** is an integer related to the size, in bytes, of the internal representation data, as described below.
- **pData** is either **NULL** or a pointer to an block of data into which the implementation will write the textual form of the internal representation.

If **pData** is **NULL**, then the size, in bytes, of the internal representation data is returned in **dataSize**. Otherwise, **dataSize** must be the size of the buffer, in bytes, pointed to by **pData** and on return **dataSize** is overwritten with the number of bytes of data actually written to **pData** including any trailing null character. If **dataSize** is less than the size, in bytes, of the internal representation data, at most **dataSize** bytes of data will be written to **pData** and **vkGetPipelineExecutableInternalRepresentationsKHR** will return **VK\_INCOMPLETE**. If **isText** is **VK\_TRUE** and **pData** is not **NULL** and **dataSize** is not zero, the last byte written to **pData** will be a null character.

## Valid Usage (Implicit)

- **sType** **must** be **VK\_STRUCTURE\_TYPE\_PIPELINE\_EXECUTABLE\_INTERNAL\_REPRESENTATION\_KHR**
- **pNext** **must** be **NULL**
- **name** **must** be a null-terminated UTF-8 string whose length is less than or equal to **VK\_MAX\_DESCRIPTION\_SIZE**
- **description** **must** be a null-terminated UTF-8 string whose length is less than or equal to **VK\_MAX\_DESCRIPTION\_SIZE**
- If **dataSize** is not **0**, and **pData** is not **NULL**, **pData** **must** be a valid pointer to an array of **dataSize** bytes

Information about a particular shader that has been compiled as part of a pipeline object can be

extracted by calling:

```
VkResult vkGetShaderInfoAMD(  
    VkDevice device,  
    VkPipeline pipeline,  
    VkShaderStageFlagBits shaderStage,  
    VkShaderInfoTypeAMD infoType,  
    size_t* pInfoSize,  
    void* pInfo);
```

- `device` is the device that created `pipeline`.
- `pipeline` is the target of the query.
- `shaderStage` identifies the particular shader within the pipeline about which information is being queried.
- `infoType` describes what kind of information is being queried.
- `pInfoSize` is a pointer to a value related to the amount of data the query returns, as described below.
- `pInfo` is either `NULL` or a pointer to a buffer.

If `pInfo` is `NULL`, then the maximum size of the information that **can** be retrieved about the shader, in bytes, is returned in `pInfoSize`. Otherwise, `pInfoSize` **must** point to a variable set by the user to the size of the buffer, in bytes, pointed to by `pInfo`, and on return the variable is overwritten with the amount of data actually written to `pInfo`.

If `pInfoSize` is less than the maximum size that **can** be retrieved by the pipeline cache, then at most `pInfoSize` bytes will be written to `pInfo`, and `vkGetShaderInfoAMD` will return `VK_INCOMPLETE`.

Not all information is available for every shader and implementations may not support all kinds of information for any shader. When a certain type of information is unavailable, the function returns `VK_ERROR_FEATURE_NOT_PRESENT`.

If information is successfully and fully queried, the function will return `VK_SUCCESS`.

For `infoType VK_SHADER_INFO_TYPE_STATISTICS_AMD`, an instance of `VkShaderStatisticsInfoAMD` will be written to the buffer pointed to by `pInfo`. This structure will be populated with statistics regarding the physical device resources used by that shader along with other miscellaneous information and is described in further detail below.

For `infoType VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD`, `pInfo` is a pointer to a UTF-8 null-terminated string containing human-readable disassembly. The exact formatting and contents of the disassembly string are vendor-specific.

The formatting and contents of all other types of information, including `infoType VK_SHADER_INFO_TYPE_BINARY_AMD`, are left to the vendor and are not further specified by this extension.

## Valid Usage (Implicit)

- **device** **must** be a valid `VkDevice` handle
- **pipeline** **must** be a valid `VkPipeline` handle
- **shaderStage** **must** be a valid `VkShaderStageFlagBits` value
- **infoType** **must** be a valid `VkShaderInfoTypeAMD` value
- **pInfoSize** **must** be a valid pointer to a `size_t` value
- If the value referenced by **pInfoSize** is not `0`, and **pInfo** is not `NULL`, **pInfo** **must** be a valid pointer to an array of **pInfoSize** bytes
- **pipeline** **must** have been created, allocated, or retrieved from **device**

## Return Codes

### Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

### Failure

- `VK_ERROR_FEATURE_NOT_PRESENT`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

Possible values of `vkGetShaderInfoAMD::infoType`, specifying the information being queried from a shader, are:

```
typedef enum VkShaderInfoTypeAMD {
    VK_SHADER_INFO_TYPE_STATISTICS_AMD = 0,
    VK_SHADER_INFO_TYPE_BINARY_AMD = 1,
    VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD = 2,
    VK_SHADER_INFO_TYPE_MAX_ENUM_AMD = 0x7FFFFFFF
} VkShaderInfoTypeAMD;
```

- `VK_SHADER_INFO_TYPE_STATISTICS_AMD` specifies that device resources used by a shader will be queried.
- `VK_SHADER_INFO_TYPE_BINARY_AMD` specifies that implementation-specific information will be queried.
- `VK_SHADER_INFO_TYPE_DISASSEMBLY_AMD` specifies that human-readable disassembly of a shader.

The `VkShaderStatisticsInfoAMD` structure is defined as:

```

typedef struct VkShaderStatisticsInfoAMD {
    VkShaderStageFlags          shaderStageMask;
    VkShaderResourceUsageAMD   resourceUsage;
    uint32_t                   numPhysicalVgprs;
    uint32_t                   numPhysicalSgprs;
    uint32_t                   numAvailableVgprs;
    uint32_t                   numAvailableSgprs;
    uint32_t                   computeWorkGroupSize[3];
} VkShaderStatisticsInfoAMD;

```

- **shaderStageMask** are the combination of logical shader stages contained within this shader.
- **resourceUsage** is an instance of [VkShaderResourceUsageAMD](#) describing internal physical device resources used by this shader.
- **numPhysicalVgprs** is the maximum number of vector instruction general-purpose registers (VGPRs) available to the physical device.
- **numPhysicalSgprs** is the maximum number of scalar instruction general-purpose registers (SGPRs) available to the physical device.
- **numAvailableVgprs** is the maximum limit of VGPRs made available to the shader compiler.
- **numAvailableSgprs** is the maximum limit of SGPRs made available to the shader compiler.
- **computeWorkGroupSize** is the local workgroup size of this shader in { X, Y, Z } dimensions.

Some implementations may merge multiple logical shader stages together in a single shader. In such cases, **shaderStageMask** will contain a bitmask of all of the stages that are active within that shader. Consequently, if specifying those stages as input to [vkGetShaderInfoAMD](#), the same output information **may** be returned for all such shader stage queries.

The number of available VGPRs and SGPRs (**numAvailableVgprs** and **numAvailableSgprs** respectively) are the shader-addressable subset of physical registers that is given as a limit to the compiler for register assignment. These values **may** further be limited by implementations due to performance optimizations where register pressure is a bottleneck.

The [VkShaderResourceUsageAMD](#) structure is defined as:

```

typedef struct VkShaderResourceUsageAMD {
    uint32_t      numUsedVgprs;
    uint32_t      numUsedSgprs;
    uint32_t      ldsSizePerLocalWorkGroup;
    size_t        ldsUsageSizeInBytes;
    size_t        scratchMemUsageInBytes;
} VkShaderResourceUsageAMD;

```

- **numUsedVgprs** is the number of vector instruction general-purpose registers used by this shader.
- **numUsedSgprs** is the number of scalar instruction general-purpose registers used by this shader.
- **ldsSizePerLocalWorkGroup** is the maximum local data store size per work group in bytes.

- `ldsUsageSizeInBytes` is the LDS usage size in bytes per work group by this shader.
- `scratchMemUsageInBytes` is the scratch memory usage in bytes by this shader.

## 9.11. Pipeline Compiler Control

The compilation of a pipeline **can** be tuned by including a `VkPipelineCompilerControlCreateInfoAMD` structure in the `pNext` chain of `VkGraphicsPipelineCreateInfo` or `VkComputePipelineCreateInfo`.

```
typedef struct VkPipelineCompilerControlCreateInfoAMD {
    VkStructureType           sType;
    const void*                pNext;
    VkPipelineCompilerControlFlagsAMD compilerControlFlags;
} VkPipelineCompilerControlCreateInfoAMD;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `compilerControlFlags` is a bitmask of `VkPipelineCompilerControlFlagBitsAMD` affecting how the pipeline will be compiled.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_COMPILER_CONTROL_CREATE_INFO_AMD`
- `compilerControlFlags` **must** be `0`

There are currently no available flags for this extension; flags will be added by future versions of this extension.

```
typedef enum VkPipelineCompilerControlFlagBitsAMD {
    VK_PIPELINE_COMPILER_CONTROL_FLAG_BITS_MAX_ENUM_AMD = 0x7FFFFFFF
} VkPipelineCompilerControlFlagBitsAMD;
```

## 9.12. Ray Tracing Pipeline

Ray tracing pipelines consist of multiple shader stages, fixed-function traversal stages, and a pipeline layout.

To create ray tracing pipelines, call:

```
VkResult vkCreateRayTracingPipelinesNV(  
    VkDevice device,  
    VkPipelineCache pipelineCache,  
    uint32_t createInfoCount,  
    const VkRayTracingPipelineCreateInfoNV* pCreateInfos,  
    const VkAllocationCallbacks* pAllocator,  
    VkPipeline* pPipelines);
```

- `device` is the logical device that creates the ray tracing pipelines.
- `pipelineCache` is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled, or the handle of a valid `pipeline cache` object, in which case use of that cache is enabled for the duration of the command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of `VkRayTracingPipelineCreateInfoNV` structures.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pPipelines` is a pointer to an array in which the resulting ray tracing pipeline objects are returned.

## Valid Usage

- If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the `basePipelineIndex` member of that same element is not `-1`, `basePipelineIndex` **must** be less than the index into `pCreateInfos` that corresponds to that element
- If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline **must** have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` **must** be a valid `VkPipelineCache` handle
- `pCreateInfos` **must** be a valid pointer to an array of `createInfoCount` valid `VkRayTracingPipelineCreateInfoNV` structures
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pPipelines` **must** be a valid pointer to an array of `createInfoCount` `VkPipeline` handles
- `createInfoCount` **must** be greater than `0`
- If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_SHADER_NV`

The `VkRayTracingPipelineCreateInfoNV` structure is defined as:

```
typedef struct VkRayTracingPipelineCreateInfoNV {
    VkStructureType                         sType;
    const void*                             pNext;
    VkPipelineCreateFlags                   flags;
    uint32_t                               stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    uint32_t                               groupCount;
    const VkRayTracingShaderGroupCreateInfoNV* pGroups;
    uint32_t                               maxRecursionDepth;
    VkPipelineLayout                        layout;
    VkPipeline                            basePipelineHandle;
    int32_t                                basePipelineIndex;
} VkRayTracingPipelineCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.

- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array of `stageCount` `VkPipelineShaderStageCreateInfo` structures describing the set of the shader stages to be included in the ray tracing pipeline.
- `groupCount` is the number of entries in the `pGroups` array.
- `pGroups` is a pointer to an array of `groupCount` `VkRayTracingShaderGroupCreateInfoNV` structures describing the set of the shader stages to be included in each shader group in the ray tracing pipeline.
- `maxRecursionDepth` is the maximum recursion that will be called from this pipeline.
- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- `basePipelineHandle` is a pipeline to derive from.
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in [Pipeline Derivatives](#).

## Valid Usage

- If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is `-1`, `basePipelineHandle` **must** be a valid handle to a ray tracing `VkPipeline`
- If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` **must** be a valid index into the calling command's `pCreateInfos` parameter
- If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is not `-1`, `basePipelineHandle` **must** be `VK_NULL_HANDLE`
- If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is not `VK_NULL_HANDLE`, `basePipelineIndex` **must** be `-1`
- The `stage` member of one element of `pStages` **must** be `VK_SHADER_STAGE_RAYGEN_BIT_NV`
- The shader code for the entry points identified by `pStages`, and the rest of the state identified by this structure **must** adhere to the pipeline linking rules described in the [Shader Interfaces](#) chapter
- `layout` **must** be consistent with all shaders specified in `pStages`
- The number of resources in `layout` accessible to each shader stage that is used by the pipeline **must** be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`
- `maxRecursionDepth` **must** be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxRecursionDepth`

## Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CREATE_INFO_NV`
- **pNext** must be `NULL` or a pointer to a valid instance of `VkPipelineCreationFeedbackCreateInfoEXT`
- **flags** must be a valid combination of `VkPipelineCreateFlagBits` values
- **pStages** must be a valid pointer to an array of **stageCount** valid `VkPipelineShaderStageCreateInfo` structures
- **pGroups** must be a valid pointer to an array of **groupCount** valid `VkRayTracingShaderGroupCreateInfoNV` structures
- **layout** must be a valid `VkPipelineLayout` handle
- **stageCount** must be greater than `0`
- **groupCount** must be greater than `0`
- Both of `basePipelineHandle`, and `layout` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

The `VkRayTracingShaderGroupCreateInfoNV` structure is defined as:

```
typedef struct VkRayTracingShaderGroupCreateInfoNV {
    VkStructureType           sType;
    const void*               pNext;
    VkRayTracingShaderGroupTypeNV type;
    uint32_t                  generalShader;
    uint32_t                  closestHitShader;
    uint32_t                  anyHitShader;
    uint32_t                  intersectionShader;
} VkRayTracingShaderGroupCreateInfoNV;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to an extension-specific structure.
- **type** is the type of hit group specified in this structure.
- **generalShader** is the index of the ray generation, miss, or callable shader from `VkRayTracingPipelineCreateInfoNV::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV` and `VK_SHADER_UNUSED_NV` otherwise.
- **closestHitShader** is the optional index of the closest hit shader from `VkRayTracingPipelineCreateInfoNV::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_NV` and `VK_SHADER_UNUSED_NV` otherwise.
- **anyHitShader** is the optional index of the any-hit shader from `VkRayTracingPipelineCreateInfoNV ::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV` or

`VK_RAY_TRACING_SHADER_GROUP_TYPE PROCEDURAL_HIT_GROUP_NV` and `VK_SHADER_UNUSED_NV` otherwise.

- `intersectionShader` is the index of the intersection shader from `VkRayTracingPipelineCreateInfoNV::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE PROCEDURAL_HIT_GROUP_NV` and `VK_SHADER_UNUSED_NV` otherwise.

## Valid Usage

- If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV` then `generalShader` **must** be a valid index into `pStages` referring to a shader of `VK_SHADER_STAGE_RAYGEN_BIT_NV`, `VK_SHADER_STAGE_MISS_BIT_NV`, or `VK_SHADER_STAGE_CALLABLE_BIT_NV`
- If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV` then `closestHitShader`, `anyHitShader`, and `intersectionShader` **must** be `VK_SHADER_UNUSED_NV`
- If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE PROCEDURAL_HIT_GROUP_NV` then `intersectionShader` **must** be a valid index into `pStages` referring to a shader of `VK_SHADER_STAGE_INTERSECTION_BIT_NV`
- If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV` then `intersectionShader` **must** be `VK_SHADER_UNUSED_NV`
- `closestHitShader` **must** be either `VK_SHADER_UNUSED_NV` or a valid index into `pStages` referring to a shader of `VK_SHADER_STAGE_CLOSEST_HIT_BIT_NV`
- `anyHitShader` **must** be either `VK_SHADER_UNUSED_NV` or a valid index into `pStages` referring to a shader of `VK_SHADER_STAGE_ANY_HIT_BIT_NV`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_NV`
- `pNext` **must** be `NULL`
- `type` **must** be a valid `VkRayTracingShaderGroupTypeNV` value

Possible values of `type` in `VkRayTracingShaderGroupCreateInfoNV` are:

```
typedef enum VkRayTracingShaderGroupTypeNV {
    VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV = 0,
    VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV = 1,
    VK_RAY_TRACING_SHADER_GROUP_TYPE PROCEDURAL_HIT_GROUP_NV = 2,
    VK_RAY_TRACING_SHADER_GROUP_TYPE_MAX_ENUM_NV = 0x7FFFFFFF
} VkRayTracingShaderGroupTypeNV;
```

- `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_NV` indicates a shader group with a single `VK_SHADER_STAGE_RAYGEN_BIT_NV`, `VK_SHADER_STAGE_MISS_BIT_NV`, or `VK_SHADER_STAGE_CALLABLE_BIT_NV` shader in it.
- `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_NV` specifies a shader group that only hits triangles and **must** not contain an intersection shader, only closest hit and any-hit.

- `VK_RAY_TRACING_SHADER_GROUP_TYPE PROCEDURAL_HIT_GROUP_NV` specifies a shader group that only intersects with custom geometry and **must** contain an intersection shader and **may** contain closest hit and any-hit shaders.

*Note*

For current group types, the hit group type could be inferred from the presence or absence of the intersection shader, but we provide the type explicitly for future hit groups that do not have that property.

To query the opaque handles of shaders in the ray tracing pipeline, call:

```
VkResult vkGetRayTracingShaderGroupHandlesNV(
    VkDevice                                     device,
    VkPipeline                                    pipeline,
    uint32_t                                     firstGroup,
    uint32_t                                     groupCount,
    size_t                                         dataSize,
    void*                                         pData);
```

- `device` is the logical device containing the ray tracing pipeline.
- `pipeline` is the ray tracing pipeline object containing the shaders.
- `firstGroup` is the index of the first group to retrieve a handle for from the `VkRayTracingShaderGroupCreateInfoNV::pGroups` array.
- `groupCount` is the number of shader handles to retrieve.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to a user-allocated buffer where the results will be written.

## Valid Usage

- The sum of `firstGroup` and `groupCount` **must** be less than the number of shader groups in `pipeline`.
- `dataSize` **must** be at least `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize`  $\times$  `groupCount`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pipeline` **must** be a valid `VkPipeline` handle
- `pData` **must** be a valid pointer to an array of `dataSize` bytes
- `dataSize` **must** be greater than 0
- `pipeline` **must** have been created, allocated, or retrieved from `device`

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Ray tracing pipelines **can** contain more shaders than a graphics or compute pipeline, so to allow parallel compilation of shaders within a pipeline, an application **can** choose to defer compilation until a later point in time.

To compile a deferred shader in a pipeline call:

```
VkResult vkCompileDeferredNV(  
    VkDevice device,  
    VkPipeline pipeline,  
    uint32_t shader);
```

- `device` is the logical device containing the ray tracing pipeline.
- `pipeline` is the ray tracing pipeline object containing the shaders.
- `shader` is the index of the shader to compile.

### Valid Usage

- `pipeline` **must** have been created with `VK_PIPELINE_CREATE_DEFER_COMPILE_BIT_NV`
- `shader` **must** not have been called as a deferred compile before

### Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pipeline` **must** be a valid `VkPipeline` handle
- `pipeline` **must** have been created, allocated, or retrieved from `device`

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

## 9.13. Pipeline Creation Feedback

Feedback about the creation of a particular pipeline object **can** be obtained by including a `VkPipelineCreationFeedbackCreateInfoEXT` structure in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, `VkRayTracingPipelineCreateInfoNV`, or `VkComputePipelineCreateInfo`. The `VkPipelineCreationFeedbackCreateInfoEXT` structure is defined as:

```
typedef struct VkPipelineCreationFeedbackCreateInfoEXT {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineCreationFeedbackEXT* pPipelineCreationFeedback;
    uint32_t                  pipelineStageCreationFeedbackCount;
    VkPipelineCreationFeedbackEXT* pPipelineStageCreationFeedbacks;
} VkPipelineCreationFeedbackCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `pPipelineCreationFeedback` is a pointer to a `VkPipelineCreationFeedbackEXT` structure.
- `pipelineStageCreationFeedbackCount` is the number of elements in `pPipelineStageCreationFeedbacks`.
- `pPipelineStageCreationFeedbacks` is a pointer to an array of `pipelineStageCreationFeedbackCount` `VkPipelineCreationFeedbackEXT` structures.

An implementation **should** write pipeline creation feedback to `pPipelineCreationFeedback` and **may** write pipeline stage creation feedback to `pPipelineStageCreationFeedbacks`. An implementation **must** set or clear the `VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT_EXT` in `VkPipelineCreationFeedbackEXT::flags` for `pPipelineCreationFeedback` and every element of `pPipelineStageCreationFeedbacks`.

### Note

One common scenario for an implementation to skip per-stage feedback is when `VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT_EXT` is set in `pPipelineCreationFeedback`.

When chained to `VkRayTracingPipelineCreateInfoNV` or `VkGraphicsPipelineCreateInfo`, the `i` element of `pPipelineStageCreationFeedbacks` corresponds to the `i` element of `VkRayTracingPipelineCreateInfoNV::pStages` or `VkGraphicsPipelineCreateInfo::pStages`. When chained to `VkComputePipelineCreateInfo`, the first element of `pPipelineStageCreationFeedbacks` corresponds to `VkComputePipelineCreateInfo::stage`.

## Valid Usage

- When chained to `VkGraphicsPipelineCreateInfo`, `VkPipelineCreationFeedbackEXT::pipelineStageCreationFeedbackCount` **must** equal `VkGraphicsPipelineCreateInfo::stageCount`
- When chained to `VkComputePipelineCreateInfo`, `VkPipelineCreationFeedbackEXT::pipelineStageCreationFeedbackCount` **must** equal 1
- When chained to `VkRayTracingPipelineCreateInfoNV`, `VkPipelineCreationFeedbackEXT::pipelineStageCreationFeedbackCount` **must** equal `VkRayTracingPipelineCreateInfoNV::stageCount`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_CREATION_FEEDBACK_CREATE_INFO_EXT`
- `pPipelineCreationFeedback` **must** be a valid pointer to a `VkPipelineCreationFeedbackEXT` structure
- `pPipelineStageCreationFeedbacks` **must** be a valid pointer to an array of `pipelineStageCreationFeedbackCount` `VkPipelineCreationFeedbackEXT` structures
- `pipelineStageCreationFeedbackCount` **must** be greater than 0

The `VkPipelineCreationFeedbackEXT` structure is defined as:

```
typedef struct VkPipelineCreationFeedbackEXT {
    VkPipelineCreationFeedbackFlagsEXT    flags;
    uint64_t                            duration;
} VkPipelineCreationFeedbackEXT;
```

- `flags` is a bitmask of `VkPipelineCreationFeedbackFlagBitsEXT` providing feedback about the creation of a pipeline or of a pipeline stage.
- `duration` is the duration spent creating a pipeline or pipeline stage in nanoseconds.

If the `VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT_EXT` is not set in `flags`, an implementation **must** not set any other bits in `flags`, and all other `VkPipelineCreationFeedbackEXT` data members are undefined.

Possible values of the `flags` member of `VkPipelineCreationFeedbackEXT` are:

```

typedef enum VkPipelineCreationFeedbackFlagBitsEXT {
    VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT_EXT = 0x00000001,
    VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT_EXT = 0x00000002,
    VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT_EXT = 0x00000004,
    VK_PIPELINE_CREATION_FEEDBACK_FLAG_BITS_MAX_ENUM_EXT = 0x7FFFFFFF
} VkPipelineCreationFeedbackFlagBitsEXT;

```

- **VK\_PIPELINE\_CREATION\_FEEDBACK\_VALID\_BIT\_EXT** indicates that the feedback information is valid.
- **VK\_PIPELINE\_CREATION\_FEEDBACK\_APPLICATION\_PIPELINE\_CACHE\_HIT\_BIT\_EXT** indicates that a readily usable pipeline or pipeline stage was found in the `pipelineCache` specified by the application in the pipeline creation command.

An implementation **should** set the **VK\_PIPELINE\_CREATION\_FEEDBACK\_APPLICATION\_PIPELINE\_CACHE\_HIT\_BIT\_EXT** bit if it was able to avoid the large majority of pipeline or pipeline stage creation work by using the `pipelineCache` parameter of `vkCreateGraphicsPipelines`, `vkCreateRayTracingPipelinesNV`, or `vkCreateComputePipelines`. When an implementation sets this bit for the entire pipeline, it **may** leave it unset for any stage.

*Note*

Implementations are encouraged to provide a meaningful signal to applications using this bit. The intention is to communicate to the application that the pipeline or pipeline stage was created "as fast as it gets" using the pipeline cache provided by the application. If an implementation uses an internal cache, it is discouraged from setting this bit as the feedback would be unactionable.

- **VK\_PIPELINE\_CREATION\_FEEDBACK\_BASE\_PIPELINE\_ACCELERATION\_BIT\_EXT** indicates that the base pipeline specified by the `basePipelineHandle` or `basePipelineIndex` member of the `VkPipelineCreateInfo` structure was used to accelerate the creation of the pipeline.

An implementation **should** set the **VK\_PIPELINE\_CREATION\_FEEDBACK\_BASE\_PIPELINE\_ACCELERATION\_BIT\_EXT** bit if it was able to avoid a significant amount of work by using the base pipeline.

*Note*

While "significant amount of work" is subjective, implementations are encouraged to provide a meaningful signal to applications using this bit. For example, a 1% reduction in duration may not warrant setting this bit, while a 50% reduction would.

```
typedef VkFlags VkPipelineCreationFeedbackFlagsEXT;
```

`VkPipelineCreationFeedbackFlagsEXT` is a bitmask type for providing zero or more `VkPipelineCreationFeedbackFlagBitsEXT`.

# Chapter 10. Memory Allocation

Vulkan memory is broken up into two categories, *host memory* and *device memory*.

## 10.1. Host Memory

Host memory is memory needed by the Vulkan implementation for non-device-visible storage.

*Note*

This memory **may** be used to store the implementation's representation and state of Vulkan objects.

Vulkan provides applications the opportunity to perform host memory allocations on behalf of the Vulkan implementation. If this feature is not used, the implementation will perform its own memory allocations. Since most memory allocations are off the critical path, this is not meant as a performance feature. Rather, this **can** be useful for certain embedded systems, for debugging purposes (e.g. putting a guard page after all host allocations), or for memory allocation logging.

Allocators are provided by the application as a pointer to a `VkAllocationCallbacks` structure:

```
typedef struct VkAllocationCallbacks {
    void* pUserData;
    PFN_vkAllocationFunction pfnAllocation;
    PFN_vkReallocationFunction pfnReallocation;
    PFN_vkFreeFunction pfnFree;
    PFN_vkInternalAllocationNotification pfnInternalAllocation;
    PFN_vkInternalFreeNotification pfnInternalFree;
} VkAllocationCallbacks;
```

- `pUserData` is a value to be interpreted by the implementation of the callbacks. When any of the callbacks in `VkAllocationCallbacks` are called, the Vulkan implementation will pass this value as the first parameter to the callback. This value **can** vary each time an allocator is passed into a command, even when the same object takes an allocator in multiple commands.
- `pfnAllocation` is a `PFN_vkAllocationFunction` pointer to an application-defined memory allocation function.
- `pfnReallocation` is a `PFN_vkReallocationFunction` pointer to an application-defined memory reallocation function.
- `pfnFree` is a `PFN_vkFreeFunction` pointer to an application-defined memory free function.
- `pfnInternalAllocation` is a `PFN_vkInternalAllocationNotification` pointer to an application-defined function that is called by the implementation when the implementation makes internal allocations.
- `pfnInternalFree` is a `PFN_vkInternalFreeNotification` pointer to an application-defined function that is called by the implementation when the implementation frees internal allocations.

## Valid Usage

- `pfnAllocation` **must** be a valid pointer to a valid user-defined `PFN_vkAllocationFunction`
- `pfnReallocation` **must** be a valid pointer to a valid user-defined `PFN_vkReallocationFunction`
- `pfnFree` **must** be a valid pointer to a valid user-defined `PFN_vkFreeFunction`
- If either of `pfnInternalAllocation` or `pfnInternalFree` is not `NULL`, both **must** be valid callbacks

The type of `pfnAllocation` is:

```
typedef void* (VKAPI_PTR *PFN_vkAllocationFunction)(  
    void*  
        pUserData,  
    size_t  
        size,  
    size_t  
        alignment,  
    VkSystemAllocationScope  
        allocationScope);
```

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `size` is the size in bytes of the requested allocation.
- `alignment` is the requested alignment of the allocation in bytes and **must** be a power of two.
- `allocationScope` is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described [here](#).

If `pfnAllocation` is unable to allocate the requested memory, it **must** return `NULL`. If the allocation was successful, it **must** return a valid pointer to memory allocation containing at least `size` bytes, and with the pointer value being a multiple of `alignment`.

### Note

Correct Vulkan operation **cannot** be assumed if the application does not follow these rules.

For example, `pfnAllocation` (or `pfnReallocation`) could cause termination of running Vulkan instance(s) on a failed allocation for debugging purposes, either directly or indirectly. In these circumstances, it **cannot** be assumed that any part of any affected `VkInstance` objects are going to operate correctly (even `vkDestroyInstance`), and the application **must** ensure it cleans up properly via other means (e.g. process termination).

If `pfnAllocation` returns `NULL`, and if the implementation is unable to continue correct processing of the current command without the requested allocation, it **must** treat this as a run-time error, and generate `VK_ERROR_OUT_OF_HOST_MEMORY` at the appropriate time for the command in which the condition was detected, as described in [Return Codes](#).

If the implementation is able to continue correct processing of the current command without the requested allocation, then it **may** do so, and **must** not generate `VK_ERROR_OUT_OF_HOST_MEMORY` as a result of this failed allocation.

The type of `pfnReallocation` is:

```
typedef void* (VKAPI_PTR *PFN_vkReallocationFunction)(  
    void* pUserData,  
    void* pOriginal,  
    size_t size,  
    size_t alignment,  
    VkSystemAllocationScope allocationScope);
```

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `pOriginal` **must** be either `NULL` or a pointer previously returned by `pfnReallocation` or `pfnAllocation` of a compatible allocator.
- `size` is the size in bytes of the requested allocation.
- `alignment` is the requested alignment of the allocation in bytes and **must** be a power of two.
- `allocationScope` is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described [here](#).

`pfnReallocation` **must** return an allocation with enough space for `size` bytes, and the contents of the original allocation from bytes zero to `min(original size, new size) - 1` **must** be preserved in the returned allocation. If `size` is larger than the old size, the contents of the additional space are undefined. If satisfying these requirements involves creating a new allocation, then the old allocation **should** be freed.

If `pOriginal` is `NULL`, then `pfnReallocation` **must** behave equivalently to a call to `PFN_vkAllocationFunction` with the same parameter values (without `pOriginal`).

If `size` is zero, then `pfnReallocation` **must** behave equivalently to a call to `PFN_vkFreeFunction` with the same `pUserData` parameter value, and `pMemory` equal to `pOriginal`.

If `pOriginal` is non-`NULL`, the implementation **must** ensure that `alignment` is equal to the `alignment` used to originally allocate `pOriginal`.

If this function fails and `pOriginal` is non-`NULL` the application **must** not free the old allocation.

`pfnReallocation` **must** follow the same [rules for return values as PFN\\_vkAllocationFunction](#).

The type of `pfnFree` is:

```
typedef void (VKAPI_PTR *PFN_vkFreeFunction)(  
    void* pUserData,  
    void* pMemory);
```

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `pMemory` is the allocation to be freed.

`pMemory` may be `NULL`, which the callback **must** handle safely. If `pMemory` is non-`NULL`, it **must** be a pointer previously allocated by `pfnAllocation` or `pfnReallocation`. The application **should** free this memory.

The type of `pfnInternalAllocation` is:

```
typedef void (VKAPI_PTR *PFN_vkInternalAllocationNotification)(
    void* pUserData,
    size_t size,
    VkInternalAllocationType allocationType,
    VkSystemAllocationScope allocationScope);
```

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `size` is the requested size of an allocation.
- `allocationType` is a `VkInternalAllocationType` value specifying the requested type of an allocation.
- `allocationScope` is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described [here](#).

This is a purely informational callback.

The type of `pfnInternalFree` is:

```
typedef void (VKAPI_PTR *PFN_vkInternalFreeNotification)(
    void* pUserData,
    size_t size,
    VkInternalAllocationType allocationType,
    VkSystemAllocationScope allocationScope);
```

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `size` is the requested size of an allocation.
- `allocationType` is a `VkInternalAllocationType` value specifying the requested type of an allocation.
- `allocationScope` is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described [here](#).

Each allocation has an *allocation scope* defining its lifetime and which object it is associated with. Possible values passed to the `allocationScope` parameter of the callback functions specified by `VkAllocationCallbacks`, indicating the allocation scope, are:

```

typedef enum VkSystemAllocationScope {
    VK_SYSTEM_ALLOCATION_SCOPE_COMMAND = 0,
    VK_SYSTEM_ALLOCATION_SCOPE_OBJECT = 1,
    VK_SYSTEM_ALLOCATION_SCOPE_CACHE = 2,
    VK_SYSTEM_ALLOCATION_SCOPE_DEVICE = 3,
    VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE = 4,
    VK_SYSTEM_ALLOCATION_SCOPE_MAX_ENUM = 0x7FFFFFFF
} VkSystemAllocationScope;

```

- **VK\_SYSTEM\_ALLOCATION\_SCOPE\_COMMAND** specifies that the allocation is scoped to the duration of the Vulkan command.
- **VK\_SYSTEM\_ALLOCATION\_SCOPE\_OBJECT** specifies that the allocation is scoped to the lifetime of the Vulkan object that is being created or used.
- **VK\_SYSTEM\_ALLOCATION\_SCOPE\_CACHE** specifies that the allocation is scoped to the lifetime of a **VkPipelineCache** or **VkValidationCacheEXT** object.
- **VK\_SYSTEM\_ALLOCATION\_SCOPE\_DEVICE** specifies that the allocation is scoped to the lifetime of the Vulkan device.
- **VK\_SYSTEM\_ALLOCATION\_SCOPE\_INSTANCE** specifies that the allocation is scoped to the lifetime of the Vulkan instance.

Most Vulkan commands operate on a single object, or there is a sole object that is being created or manipulated. When an allocation uses an allocation scope of **VK\_SYSTEM\_ALLOCATION\_SCOPE\_OBJECT** or **VK\_SYSTEM\_ALLOCATION\_SCOPE\_CACHE**, the allocation is scoped to the object being created or manipulated.

When an implementation requires host memory, it will make callbacks to the application using the most specific allocator and allocation scope available:

- If an allocation is scoped to the duration of a command, the allocator will use the **VK\_SYSTEM\_ALLOCATION\_SCOPE\_COMMAND** allocation scope. The most specific allocator available is used: if the object being created or manipulated has an allocator, that object's allocator will be used, else if the parent **VkDevice** has an allocator it will be used, else if the parent **VkInstance** has an allocator it will be used. Else,
- If an allocation is associated with a **VkValidationCacheEXT** or **VkPipelineCache** object, the allocator will use the **VK\_SYSTEM\_ALLOCATION\_SCOPE\_CACHE** allocation scope. The most specific allocator available is used (cache, else device, else instance). Else,
- If an allocation is scoped to the lifetime of an object, that object is being created or manipulated by the command, and that object's type is not **VkDevice** or **VkInstance**, the allocator will use an allocation scope of **VK\_SYSTEM\_ALLOCATION\_SCOPE\_OBJECT**. The most specific allocator available is used (object, else device, else instance). Else,
- If an allocation is scoped to the lifetime of a device, the allocator will use an allocation scope of **VK\_SYSTEM\_ALLOCATION\_SCOPE\_DEVICE**. The most specific allocator available is used (device, else instance). Else,
- If the allocation is scoped to the lifetime of an instance and the instance has an allocator, its allocator will be used with an allocation scope of **VK\_SYSTEM\_ALLOCATION\_SCOPE\_INSTANCE**.

- Otherwise an implementation will allocate memory through an alternative mechanism that is unspecified.

Objects that are allocated from pools do not specify their own allocator. When an implementation requires host memory for such an object, that memory is sourced from the object's parent pool's allocator.

The application is not expected to handle allocating memory that is intended for execution by the host due to the complexities of differing security implementations across multiple platforms. The implementation will allocate such memory internally and invoke an application provided informational callback when these *internal allocations* are allocated and freed. Upon allocation of executable memory, `pfnInternalAllocation` will be called. Upon freeing executable memory, `pfnInternalFree` will be called. An implementation will only call an informational callback for executable memory allocations and frees.

The `allocationType` parameter to the `pfnInternalAllocation` and `pfnInternalFree` functions **may** be one of the following values:

```
typedef enum VkInternalAllocationType {
    VK_INTERNAL_ALLOCATION_TYPE_EXECUTABLE = 0,
    VK_INTERNAL_ALLOCATION_TYPE_MAX_ENUM = 0x7FFFFFFF
} VkInternalAllocationType;
```

- `VK_INTERNAL_ALLOCATION_TYPE_EXECUTABLE` specifies that the allocation is intended for execution by the host.

An implementation **must** only make calls into an application-provided allocator during the execution of an API command. An implementation **must** only make calls into an application-provided allocator from the same thread that called the provoking API command. The implementation **should** not synchronize calls to any of the callbacks. If synchronization is needed, the callbacks **must** provide it themselves. The informational callbacks are subject to the same restrictions as the allocation callbacks.

If an implementation intends to make calls through a `VkAllocationCallbacks` structure between the time a `vkCreate*` command returns and the time a corresponding `vkDestroy*` command begins, that implementation **must** save a copy of the allocator before the `vkCreate*` command returns. The callback functions and any data structures they rely upon **must** remain valid for the lifetime of the object they are associated with.

If an allocator is provided to a `vkCreate*` command, a *compatible* allocator **must** be provided to the corresponding `vkDestroy*` command. Two `VkAllocationCallbacks` structures are compatible if memory allocated with `pfnAllocation` or `pfnReallocation` in each **can** be freed with `pfnReallocation` or `pfnFree` in the other. An allocator **must** not be provided to a `vkDestroy*` command if an allocator was not provided to the corresponding `vkCreate*` command.

If a non-`NULL` allocator is used, the `pfnAllocation`, `pfnReallocation` and `pfnFree` members **must** be non-`NULL` and point to valid implementations of the callbacks. An application **can** choose to not provide informational callbacks by setting both `pfnInternalAllocation` and `pfnInternalFree` to `NULL`. `pfnInternalAllocation` and `pfnInternalFree` **must** either both be `NULL` or both be non-`NULL`.

If `pfnAllocation` or `pfnReallocation` fail, the implementation **may** fail object creation and/or generate an `VK_ERROR_OUT_OF_HOST_MEMORY` error, as appropriate.

Allocation callbacks **must** not call any Vulkan commands.

The following sets of rules define when an implementation is permitted to call the allocator callbacks.

`pfnAllocation` or `pfnReallocation` **may** be called in the following situations:

- Allocations scoped to a `VkDevice` or `VkInstance` **may** be allocated from any API command.
- Allocations scoped to a command **may** be allocated from any API command.
- Allocations scoped to a `VkPipelineCache` **may** only be allocated from:
  - `vkCreatePipelineCache`
  - `vkMergePipelineCaches` for `dstCache`
  - `vkCreateGraphicsPipelines` for `pipelineCache`
  - `vkCreateComputePipelines` for `pipelineCache`
- Allocations scoped to a `VkValidationCacheEXT` **may** only be allocated from:
  - `vkCreateValidationCacheEXT`
  - `vkMergeValidationCachesEXT` for `dstCache`
  - `vkCreateShaderModule` for `validationCache` in `VkShaderModuleValidationCacheCreateInfoEXT`
- Allocations scoped to a `VkDescriptorPool` **may** only be allocated from:
  - any command that takes the pool as a direct argument
  - `vkAllocateDescriptorSets` for the `descriptorPool` member of its `pAllocateInfo` parameter
  - `vkCreateDescriptorPool`
- Allocations scoped to a `VkCommandPool` **may** only be allocated from:
  - any command that takes the pool as a direct argument
  - `vkCreateCommandPool`
  - `vkAllocateCommandBuffers` for the `commandPool` member of its `pAllocateInfo` parameter
  - any `vkCmd*` command whose `commandBuffer` was allocated from that `VkCommandPool`
- Allocations scoped to any other object **may** only be allocated in that object's `vkCreate*` command.

`pfnFree`, or `pfnReallocation` with zero `size`, **may** be called in the following situations:

- Allocations scoped to a `VkDevice` or `VkInstance` **may** be freed from any API command.
- Allocations scoped to a command **must** be freed by any API command which allocates such memory.
- Allocations scoped to a `VkPipelineCache` **may** be freed from `vkDestroyPipelineCache`.
- Allocations scoped to a `VkValidationCacheEXT` **may** be freed from `vkDestroyValidationCacheEXT`.
- Allocations scoped to a `VkDescriptorPool` **may** be freed from

- any command that takes the pool as a direct argument
- Allocations scoped to a `VkCommandPool` **may** be freed from:
  - any command that takes the pool as a direct argument
  - `vkResetCommandBuffer` whose `commandBuffer` was allocated from that `VkCommandPool`
- Allocations scoped to any other object **may** be freed in that object's `vkDestroy*` command.
- Any command that allocates host memory **may** also free host memory of the same scope.

## 10.2. Device Memory

*Device memory* is memory that is visible to the device — for example the contents of the image or buffer objects, which **can** be natively used by the device.

Memory properties of a physical device describe the memory heaps and memory types available.

To query memory properties, call:

```
void vkGetPhysicalDeviceMemoryProperties(
    VkPhysicalDevice                  physicalDevice,
    VkPhysicalDeviceMemoryProperties* pMemoryProperties);
```

- `physicalDevice` is the handle to the device to query.
- `pMemoryProperties` is a pointer to a `VkPhysicalDeviceMemoryProperties` structure in which the properties are returned.

### Valid Usage (Implicit)

- `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- `pMemoryProperties` **must** be a valid pointer to a `VkPhysicalDeviceMemoryProperties` structure

The `VkPhysicalDeviceMemoryProperties` structure is defined as:

```
typedef struct VkPhysicalDeviceMemoryProperties {
    uint32_t      memoryTypeCount;
    VkMemoryType   memoryTypes[VK_MAX_MEMORY_TYPES];
    uint32_t      memoryHeapCount;
    VkMemoryHeap   memoryHeaps[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryProperties;
```

- `memoryTypeCount` is the number of valid elements in the `memoryTypes` array.
- `memoryTypes` is an array of `VK_MAX_MEMORY_TYPES` `VkMemoryType` structures describing the *memory types* that **can** be used to access memory allocated from the heaps specified by `memoryHeaps`.

- `memoryHeapCount` is the number of valid elements in the `memoryHeaps` array.
- `memoryHeaps` is an array of `VK_MAX_MEMORY_HEAPS` `VkMemoryHeap` structures describing the *memory heaps* from which memory **can** be allocated.

The `VkPhysicalDeviceMemoryProperties` structure describes a number of *memory heaps* as well as a number of *memory types* that **can** be used to access memory allocated in those heaps. Each heap describes a memory resource of a particular size, and each memory type describes a set of memory properties (e.g. host cached vs uncached) that **can** be used with a given memory heap. Allocations using a particular memory type will consume resources from the heap indicated by that memory type's heap index. More than one memory type **may** share each heap, and the heaps and memory types provide a mechanism to advertise an accurate size of the physical memory resources while allowing the memory to be used with a variety of different properties.

The number of memory heaps is given by `memoryHeapCount` and is less than or equal to `VK_MAX_MEMORY_HEAPS`. Each heap is described by an element of the `memoryHeaps` array as a `VkMemoryHeap` structure. The number of memory types available across all memory heaps is given by `memoryTypeCount` and is less than or equal to `VK_MAX_MEMORY_TYPES`. Each memory type is described by an element of the `memoryTypes` array as a `VkMemoryType` structure.

At least one heap **must** include `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` in `VkMemoryHeap::flags`. If there are multiple heaps that all have similar performance characteristics, they **may** all include `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT`. In a unified memory architecture (UMA) system there is often only a single memory heap which is considered to be equally “local” to the host and to the device, and such an implementation **must** advertise the heap as device-local.

Each memory type returned by `vkGetPhysicalDeviceMemoryProperties` **must** have its `propertyFlags` set to one of the following values:

- 0
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT`
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT`
- `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`

- VK\_MEMORY\_PROPERTY\_HOST\_COHERENT\_BIT
- VK\_MEMORY\_PROPERTY\_DEVICE\_LOCAL\_BIT |  
VK\_MEMORY\_PROPERTY\_LAZILY\_ALLOCATED\_BIT
- VK\_MEMORY\_PROPERTY\_PROTECTED\_BIT
- VK\_MEMORY\_PROPERTY\_PROTECTED\_BIT | VK\_MEMORY\_PROPERTY\_DEVICE\_LOCAL\_BIT
- VK\_MEMORY\_PROPERTY\_HOST\_VISIBLE\_BIT |  
VK\_MEMORY\_PROPERTY\_HOST\_COHERENT\_BIT |  
VK\_MEMORY\_PROPERTY\_DEVICE\_COHERENT\_BIT\_AMD
- VK\_MEMORY\_PROPERTY\_HOST\_VISIBLE\_BIT |  
VK\_MEMORY\_PROPERTY\_HOST\_CACHED\_BIT |  
VK\_MEMORY\_PROPERTY\_HOST\_COHERENT\_BIT |  
VK\_MEMORY\_PROPERTY\_DEVICE\_COHERENT\_BIT\_AMD
- VK\_MEMORY\_PROPERTY\_DEVICE\_LOCAL\_BIT |  
VK\_MEMORY\_PROPERTY\_DEVICE\_COHERENT\_BIT\_AMD
- VK\_MEMORY\_PROPERTY\_DEVICE\_LOCAL\_BIT |  
VK\_MEMORY\_PROPERTY\_HOST\_VISIBLE\_BIT |  
VK\_MEMORY\_PROPERTY\_HOST\_COHERENT\_BIT |  
VK\_MEMORY\_PROPERTY\_DEVICE\_COHERENT\_BIT\_AMD
- VK\_MEMORY\_PROPERTY\_DEVICE\_LOCAL\_BIT |  
VK\_MEMORY\_PROPERTY\_HOST\_VISIBLE\_BIT |  
VK\_MEMORY\_PROPERTY\_HOST\_CACHED\_BIT |  
VK\_MEMORY\_PROPERTY\_HOST\_COHERENT\_BIT |  
VK\_MEMORY\_PROPERTY\_DEVICE\_COHERENT\_BIT\_AMD
- VK\_MEMORY\_PROPERTY\_HOST\_VISIBLE\_BIT |  
VK\_MEMORY\_PROPERTY\_HOST\_COHERENT\_BIT |  
VK\_MEMORY\_PROPERTY\_DEVICE\_COHERENT\_BIT\_AMD |  
VK\_MEMORY\_PROPERTY\_DEVICE\_UNCACHED\_BIT\_AMD
- VK\_MEMORY\_PROPERTY\_HOST\_VISIBLE\_BIT |  
VK\_MEMORY\_PROPERTY\_HOST\_CACHED\_BIT |  
VK\_MEMORY\_PROPERTY\_HOST\_COHERENT\_BIT |  
VK\_MEMORY\_PROPERTY\_DEVICE\_COHERENT\_BIT\_AMD |  
VK\_MEMORY\_PROPERTY\_DEVICE\_UNCACHED\_BIT\_AMD
- VK\_MEMORY\_PROPERTY\_DEVICE\_LOCAL\_BIT |  
VK\_MEMORY\_PROPERTY\_DEVICE\_COHERENT\_BIT\_AMD |  
VK\_MEMORY\_PROPERTY\_DEVICE\_UNCACHED\_BIT\_AMD
- VK\_MEMORY\_PROPERTY\_DEVICE\_LOCAL\_BIT |  
VK\_MEMORY\_PROPERTY\_HOST\_VISIBLE\_BIT |  
VK\_MEMORY\_PROPERTY\_HOST\_COHERENT\_BIT |  
VK\_MEMORY\_PROPERTY\_DEVICE\_COHERENT\_BIT\_AMD |  
VK\_MEMORY\_PROPERTY\_DEVICE\_UNCACHED\_BIT\_AMD
- VK\_MEMORY\_PROPERTY\_DEVICE\_LOCAL\_BIT |  
VK\_MEMORY\_PROPERTY\_HOST\_VISIBLE\_BIT |  
VK\_MEMORY\_PROPERTY\_HOST\_CACHED\_BIT |

```
VK_MEMORY_PROPERTY_HOST_COHERENT_BIT |  
VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD |  
VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD
```

There **must** be at least one memory type with both the `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` and `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` bits set in its `propertyFlags`. There **must** be at least one memory type with the `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` bit set in its `propertyFlags`. If the `deviceCoherentMemory` feature is enabled, there **must** be at least one memory type with the `VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD` bit set in its `propertyFlags`.

For each pair of elements **X** and **Y** returned in `memoryTypes`, **X** **must** be placed at a lower index position than **Y** if:

- either the set of bit flags returned in the `propertyFlags` member of **X** is a strict subset of the set of bit flags returned in the `propertyFlags` member of **Y**; or
- the `propertyFlags` members of **X** and **Y** are equal, and **X** belongs to a memory heap with greater performance (as determined in an implementation-specific manner); or
- or the `propertyFlags` members of **X** includes `VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD` or `VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD` and **Y** does not

*Note*

There is no ordering requirement between **X** and **Y** elements for the case their `propertyFlags` members are not in a subset relation. That potentially allows more than one possible way to order the same set of memory types. Notice that the [list of all allowed memory property flag combinations](#) is written in a valid order. But if instead `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` was before `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`, the list would still be in a valid order.

There may be a performance penalty for using device coherent or uncached device memory types, and using these accidentally is undesirable. In order to avoid this, memory types with these properties always appear at the end of the list; but are subject to the same rules otherwise.

This ordering requirement enables applications to use a simple search loop to select the desired memory type along the lines of:

```

// Find a memory in `memoryTypeBitsRequirement` that includes all of
// `requiredProperties`
int32_t findProperties(const VkPhysicalDeviceMemoryProperties* pMemoryProperties,
                      uint32_t memoryTypeBitsRequirement,
                      VkMemoryPropertyFlags requiredProperties) {
    const uint32_t memoryCount = pMemoryProperties->memoryTypeCount;
    for (uint32_t memoryIndex = 0; memoryIndex < memoryCount; ++memoryIndex) {
        const uint32_t memoryTypeBits = (1 << memoryIndex);
        const bool isRequiredMemoryType = memoryTypeBitsRequirement & memoryTypeBits;

        const VkMemoryPropertyFlags properties =
            pMemoryProperties->memoryTypes[memoryIndex].propertyFlags;
        const bool hasRequiredProperties =
            (properties & requiredProperties) == requiredProperties;

        if (isRequiredMemoryType && hasRequiredProperties)
            return static_cast<int32_t>(memoryIndex);
    }

    // failed to find memory type
    return -1;
}

// Try to find an optimal memory type, or if it does not exist try fallback memory
// type
// 'device' is the VkDevice
// 'image' is the VkImage that requires memory to be bound
// 'memoryProperties' properties as returned by vkGetPhysicalDeviceMemoryProperties
// 'requiredProperties' are the property flags that must be present
// 'optimalProperties' are the property flags that are preferred by the application
VkMemoryRequirements memoryRequirements;
vkGetImageMemoryRequirements(device, image, &memoryRequirements);
int32_t memoryType =
    findProperties(&memoryProperties, memoryRequirements.memoryTypeBits,
optimalProperties);
if (memoryType == -1) // not found; try fallback properties
    memoryType =
        findProperties(&memoryProperties, memoryRequirements.memoryTypeBits,
requiredProperties);

```

To query memory properties, call:

```

void vkGetPhysicalDeviceMemoryProperties2(
    VkPhysicalDevice                                     physicalDevice,
    VkPhysicalDeviceMemoryProperties2*                  pMemoryProperties);

```

or the equivalent command

```
void vkGetPhysicalDeviceMemoryProperties2KHR(  
    VkPhysicalDevice physicalDevice,  
    VkPhysicalDeviceMemoryProperties2* pMemoryProperties);
```

- `physicalDevice` is the handle to the device to query.
- `pMemoryProperties` is a pointer to a `VkPhysicalDeviceMemoryProperties2` structure in which the properties are returned.

`vkGetPhysicalDeviceMemoryProperties2` behaves similarly to `vkGetPhysicalDeviceMemoryProperties`, with the ability to return extended information in a `pNext` chain of output structures.

### Valid Usage (Implicit)

- `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- `pMemoryProperties` **must** be a valid pointer to a `VkPhysicalDeviceMemoryProperties2` structure

The `VkPhysicalDeviceMemoryProperties2` structure is defined as:

```
typedef struct VkPhysicalDeviceMemoryProperties2 {  
    VkStructureType sType;  
    void* pNext;  
    VkPhysicalDeviceMemoryProperties memoryProperties;  
} VkPhysicalDeviceMemoryProperties2;
```

or the equivalent

```
typedef VkPhysicalDeviceMemoryProperties2 VkPhysicalDeviceMemoryProperties2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `memoryProperties` is a `VkPhysicalDeviceMemoryProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceMemoryProperties`.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_PROPERTIES_2`
- `pNext` **must** be `NULL` or a pointer to a valid instance of `VkPhysicalDeviceMemoryBudgetPropertiesEXT`

The `VkMemoryHeap` structure is defined as:

```
typedef struct VkMemoryHeap {
    VkDeviceSize      size;
    VkMemoryHeapFlags flags;
} VkMemoryHeap;
```

- `size` is the total memory size in bytes in the heap.
- `flags` is a bitmask of `VkMemoryHeapFlagBits` specifying attribute flags for the heap.

Bits which **may** be set in `VkMemoryHeap::flags`, indicating attribute flags for the heap, are:

```
typedef enum VkMemoryHeapFlagBits {
    VK_MEMORY_HEAP_DEVICE_LOCAL_BIT = 0x00000001,
    VK_MEMORY_HEAP_MULTI_INSTANCE_BIT = 0x00000002,
    VK_MEMORY_HEAP_MULTI_INSTANCE_BIT_KHR = VK_MEMORY_HEAP_MULTI_INSTANCE_BIT,
    VK_MEMORY_HEAP_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkMemoryHeapFlagBits;
```

- `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` specifies that the heap corresponds to device local memory. Device local memory **may** have different performance characteristics than host local memory, and **may** support different memory property flags.
- `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` specifies that in a logical device representing more than one physical device, there is a per-physical device instance of the heap memory. By default, an allocation from such a heap will be replicated to each physical device's instance of the heap.

```
typedef VkFlags VkMemoryHeapFlags;
```

`VkMemoryHeapFlags` is a bitmask type for setting a mask of zero or more `VkMemoryHeapFlagBits`.

The `VkMemoryType` structure is defined as:

```
typedef struct VkMemoryType {
    VkMemoryPropertyFlags   propertyFlags;
    uint32_t                heapIndex;
} VkMemoryType;
```

- `heapIndex` describes which memory heap this memory type corresponds to, and **must** be less than `memoryHeapCount` from the `VkPhysicalDeviceMemoryProperties` structure.
- `propertyFlags` is a bitmask of `VkMemoryPropertyFlagBits` of properties for this memory type.

Bits which **may** be set in `VkMemoryType::propertyFlags`, indicating properties of a memory heap, are:

```

typedef enum VkMemoryPropertyFlagBits {
    VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT = 0x00000001,
    VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT = 0x00000002,
    VK_MEMORY_PROPERTY_HOST_COHERENT_BIT = 0x00000004,
    VK_MEMORY_PROPERTY_HOST_CACHED_BIT = 0x00000008,
    VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT = 0x00000010,
    VK_MEMORY_PROPERTY_PROTECTED_BIT = 0x00000020,
    VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD = 0x00000040,
    VK_MEMORY_PROPERTY_DEVICE_UNCACHED_BIT_AMD = 0x00000080,
    VK_MEMORY_PROPERTY_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkMemoryPropertyFlagBits;

```

- **VK\_MEMORY\_PROPERTY\_DEVICE\_LOCAL\_BIT** bit specifies that memory allocated with this type is the most efficient for device access. This property will be set if and only if the memory type belongs to a heap with the **VK\_MEMORY\_HEAP\_DEVICE\_LOCAL\_BIT** set.
- **VK\_MEMORY\_PROPERTY\_HOST\_VISIBLE\_BIT** bit specifies that memory allocated with this type **can** be mapped for host access using [vkMapMemory](#).
- **VK\_MEMORY\_PROPERTY\_HOST\_COHERENT\_BIT** bit specifies that the host cache management commands [vkFlushMappedMemoryRanges](#) and [vkInvalidateMappedMemoryRanges](#) are not needed to flush host writes to the device or make device writes visible to the host, respectively.
- **VK\_MEMORY\_PROPERTY\_HOST\_CACHED\_BIT** bit specifies that memory allocated with this type is cached on the host. Host memory accesses to uncached memory are slower than to cached memory, however uncached memory is always host coherent.
- **VK\_MEMORY\_PROPERTY\_LAZILY\_ALLOCATED\_BIT** bit specifies that the memory type only allows device access to the memory. Memory types **must** not have both **VK\_MEMORY\_PROPERTY\_LAZILY\_ALLOCATED\_BIT** and **VK\_MEMORY\_PROPERTY\_HOST\_VISIBLE\_BIT** set. Additionally, the object's backing memory **may** be provided by the implementation lazily as specified in [Lazily Allocated Memory](#).
- **VK\_MEMORY\_PROPERTY\_PROTECTED\_BIT** bit specifies that the memory type only allows device access to the memory, and allows protected queue operations to access the memory. Memory types **must** not have **VK\_MEMORY\_PROPERTY\_PROTECTED\_BIT** set and any of **VK\_MEMORY\_PROPERTY\_HOST\_VISIBLE\_BIT** set, or **VK\_MEMORY\_PROPERTY\_HOST\_COHERENT\_BIT** set, or **VK\_MEMORY\_PROPERTY\_HOST\_CACHED\_BIT** set.
- **VK\_MEMORY\_PROPERTY\_DEVICE\_COHERENT\_BIT\_AMD** bit specifies that device accesses to allocations of this memory type are automatically made available and visible.
- **VK\_MEMORY\_PROPERTY\_DEVICE\_UNCACHED\_BIT\_AMD** bit specifies that memory allocated with this type is not cached on the device. Uncached device memory is always device coherent.

For any memory allocated with both the **VK\_MEMORY\_PROPERTY\_HOST\_COHERENT\_BIT** and the **VK\_MEMORY\_PROPERTY\_DEVICE\_COHERENT\_BIT\_AMD**, host or device accesses also perform automatic memory domain transfer operations, such that writes are always automatically available and visible to both host and device memory domains.

*Note*

Device coherence is a useful property for certain debugging use cases (e.g. crash analysis, where performing separate coherence actions could mean values are not reported correctly). However, device coherent accesses may be slower than equivalent accesses without device coherence, particularly if they are also device uncached. For device uncached memory in particular, repeated accesses to the same or neighbouring memory locations over a short time period (e.g. within a frame) may be slower than it would be for the equivalent cached memory type. As such, it's generally inadvisable to use device coherent or device uncached memory except when really needed.

```
typedef VkFlags VkMemoryPropertyFlags;
```

`VkMemoryPropertyFlags` is a bitmask type for setting a mask of zero or more `VkMemoryPropertyFlagBits`.

If the `VkPhysicalDeviceMemoryBudgetPropertiesEXT` structure is included in the `pNext` chain of `VkPhysicalDeviceMemoryProperties2`, it is filled with the current memory budgets and usages.

The `VkPhysicalDeviceMemoryBudgetPropertiesEXT` structure is defined as:

```
typedef struct VkPhysicalDeviceMemoryBudgetPropertiesEXT {
    VkStructureType    sType;
    void*              pNext;
    VkDeviceSize       heapBudget[VK_MAX_MEMORY_HEAPS];
    VkDeviceSize       heapUsage[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryBudgetPropertiesEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `heapBudget` is an array of `VK_MAX_MEMORY_HEAPS` `VkDeviceSize` values in which memory budgets are returned, with one element for each memory heap. A heap's budget is a rough estimate of how much memory the process **can** allocate from that heap before allocations **may** fail or cause performance degradation. The budget includes any currently allocated device memory.
- `heapUsage` is an array of `VK_MAX_MEMORY_HEAPS` `VkDeviceSize` values in which memory usages are returned, with one element for each memory heap. A heap's usage is an estimate of how much memory the process is currently using in that heap.

The values returned in this structure are not invariant. The `heapBudget` and `heapUsage` values **must** be zero for array elements greater than or equal to `VkPhysicalDeviceMemoryProperties::memoryHeapCount`. The `heapBudget` value **must** be non-zero for array elements less than `VkPhysicalDeviceMemoryProperties::memoryHeapCount`. The `heapBudget` value **must** be less than or equal to `VkMemoryHeap::size` for each heap.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_BUDGET_PROPERTIES_EXT`

A Vulkan device operates on data in device memory via memory objects that are represented in the API by a `VkDeviceMemory` handle:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeviceMemory)
```

To allocate memory objects, call:

```
VkResult vkAllocateMemory(  
    VkDevice device,  
    const VkMemoryAllocateInfo* pAllocateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkDeviceMemory* pMemory);
```

- `device` is the logical device that owns the memory.
- `pAllocateInfo` is a pointer to a `VkMemoryAllocateInfo` structure describing parameters of the allocation. A successful returned allocation **must** use the requested parameters—no substitution is permitted by the implementation.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pMemory` is a pointer to a `VkDeviceMemory` handle in which information about the allocated memory is returned.

Allocations returned by `vkAllocateMemory` are guaranteed to meet any alignment requirement of the implementation. For example, if an implementation requires 128 byte alignment for images and 64 byte alignment for buffers, the device memory returned through this mechanism would be 128-byte aligned. This ensures that applications **can** correctly suballocate objects of different types (with potentially different alignment requirements) in the same memory object.

When memory is allocated, its contents are undefined with the following constraint:

- The contents of unprotected memory **must** not be a function of data protected memory objects, even if those memory objects were previously freed.

### Note

The contents of memory allocated by one application **should** not be a function of data from protected memory objects of another application, even if those memory objects were previously freed.

The maximum number of valid memory allocations that **can** exist simultaneously within a `VkDevice` **may** be restricted by implementation- or platform-dependent limits. If a call to `vkAllocateMemory` would cause the total number of allocations to exceed these limits, such a call

will fail and **must** return `VK_ERROR_TOO_MANY_OBJECTS`. The `maxMemoryAllocationCount` feature describes the number of allocations that **can** exist simultaneously before encountering these internal limits.

Some platforms **may** have a limit on the maximum size of a single allocation. For example, certain systems **may** fail to create allocations with a size greater than or equal to 4GB. Such a limit is implementation-dependent, and if such a failure occurs then the error `VK_ERROR_OUT_OF_DEVICE_MEMORY` **must** be returned. This limit is advertised in `VkPhysicalDeviceMaintenance3Properties::maxMemoryAllocationSize`.

The cumulative memory size allocated to a heap **can** be limited by the size of the specified heap. In such cases, allocated memory is tracked on a per-device and per-heap basis. Some platforms allow overallocation into other heaps. The overallocation behavior **can** be specified through the `VK_AMD_memory_overallocation_behavior` extension.

## Valid Usage

- `pAllocateInfo->allocationSize` **must** be less than or equal to `VkPhysicalDeviceMemoryProperties::memoryHeaps[memindex].size` where `memindex = VkPhysicalDeviceMemoryProperties::memoryTypes[pAllocateInfo->memoryTypeIndex].heapIndex` as returned by `vkGetPhysicalDeviceMemoryProperties` for the `VkPhysicalDevice` that `device` was created from.
- `pAllocateInfo->memoryTypeIndex` **must** be less than `VkPhysicalDeviceMemoryProperties ::memoryTypeCount` as returned by `vkGetPhysicalDeviceMemoryProperties` for the `VkPhysicalDevice` that `device` was created from.
- If the `deviceCoherentMemory` feature is not enabled, `pAllocateInfo->memoryTypeIndex` **must** not identify a memory type supporting `VK_MEMORY_PROPERTY_DEVICE_COHERENT_BIT_AMD`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pAllocateInfo` **must** be a valid pointer to a valid `VkMemoryAllocateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pMemory` **must** be a valid pointer to a `VkDeviceMemory` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`

The `VkMemoryAllocateInfo` structure is defined as:

```
typedef struct VkMemoryAllocateInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceSize       allocationSize;
    uint32_t           memoryTypeIndex;
} VkMemoryAllocateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `allocationSize` is the size of the allocation in bytes
- `memoryTypeIndex` is an index identifying a memory type from the `memoryTypes` array of the `VkPhysicalDeviceMemoryProperties` structure

An instance of the `VkMemoryAllocateInfo` structure defines a memory import operation if the `pNext` chain contains an instance of one of the following structures:

- `VkImportMemoryWin32HandleInfoKHR` with non-zero `handleType` value
- `VkImportMemoryFdInfoKHR` with a non-zero `handleType` value
- `VkImportMemoryHostPointerInfoEXT` with a non-zero `handleType` value
- `VkImportAndroidHardwareBufferInfoANDROID` with a non-`NULL` `buffer` value

Importing memory **must** not modify the content of the memory. Implementations **must** ensure that importing memory does not enable the importing Vulkan instance to access any memory or resources in other Vulkan instances other than that corresponding to the memory object imported. Implementations **must** also ensure accessing imported memory which has not been initialized does not allow the importing Vulkan instance to obtain data from the exporting Vulkan instance or vice-versa.

*Note*

How exported and imported memory is isolated is left to the implementation, but applications should be aware that such isolation **may** prevent implementations from placing multiple exportable memory objects in the same physical or virtual page. Hence, applications **should** avoid creating many small external memory objects whenever possible.

When performing a memory import operation, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations **must** perform sufficient validation of external handles to ensure that the operation results in a valid memory object which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its allocation parameters. If the external handle provided does not meet these requirements, the implementation **must** fail the memory import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

## Valid Usage

- If the `pNext` chain contains an instance of `VkExportMemoryAllocateInfo`, and any of the handle types specified in `VkExportMemoryAllocateInfo::handleTypes` require a dedicated allocation, as reported by `vkGetPhysicalDeviceImageFormatProperties2` in `VkExternalImageFormatProperties::externalMemoryProperties::externalMemoryFeatures` or `VkExternalBufferProperties::externalMemoryProperties::externalMemoryFeatures`, the `pNext` chain must contain an instance of `VkMemoryDedicatedAllocateInfo` or `VkDedicatedAllocationMemoryAllocateInfoNV` with either its `image` or `buffer` field set to a value other than `VK_NULL_HANDLE`.
- If the `pNext` chain contains an instance of `VkExportMemoryAllocateInfo`, it **must** not contain an instance of `VkExportMemoryAllocateInfoNV` or `VkExportMemoryWin32HandleInfoNV`.
- If the `pNext` chain contains an instance of `VkImportMemoryWin32HandleInfoKHR`, it **must** not contain an instance of `VkImportMemoryWin32HandleInfoNV`.
- If the parameters define an import operation, the external handle specified was created by the Vulkan API, and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT_KHR`, then the values of `allocationSize` and `memoryTypeIndex` **must** match those specified when the memory object being imported was created.
- If the parameters define an import operation and the external handle specified was created by the Vulkan API, the device mask specified by `VkMemoryAllocateFlagsInfo` **must** match that specified when the memory object being imported was allocated.
- If the parameters define an import operation and the external handle specified was created by the Vulkan API, the list of physical devices that comprise the logical device passed to `vkAllocateMemory` **must** match the list of physical devices that comprise the logical device on which the memory was originally allocated.
- If the parameters define an import operation and the external handle is an NT handle or a global share handle created outside of the Vulkan API, the value of `memoryTypeIndex` **must** be one of those returned by `vkGetMemoryWin32HandlePropertiesKHR`.
- If the parameters define an import operation, the external handle was created by the Vulkan API, and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_KHR`, then the values of `allocationSize` and `memoryTypeIndex` **must** match those specified when the memory object being imported was created.
- If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, `allocationSize` **must** match the size reported in the memory requirements of the `image` or `buffer` member of the instance of `VkDedicatedAllocationMemoryAllocateInfoNV` included in the `pNext` chain.
- If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, `allocationSize` **must** match the size

specified when creating the Direct3D 12 heap from which the external handle was extracted.

- If the parameters define an import operation and the external handle is a POSIX file descriptor created outside of the Vulkan API, the value of `memoryTypeIndex` **must** be one of those returned by [vkGetMemoryFdPropertiesKHR](#).
- If the protected memory feature is not enabled, the `VkMemoryAllocateInfo::memoryTypeIndex` **must** not indicate a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`.
- If the parameters define an import operation and the external handle is a host pointer, the value of `memoryTypeIndex` **must** be one of those returned by [vkGetMemoryHostPointerPropertiesEXT](#)
- If the parameters define an import operation and the external handle is a host pointer, `allocationSize` **must** be an integer multiple of [VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment](#)
- If the parameters define an import operation and the external handle is a host pointer, the `pNext` chain **must** not contain an instance of [VkDedicatedAllocationMemoryAllocateInfoNV](#) with either its `image` or `buffer` field set to a value other than `VK_NULL_HANDLE`.
- If the parameters define an import operation and the external handle is a host pointer, the `pNext` chain **must** not contain an instance of [VkMemoryDedicatedAllocateInfo](#) with either its `image` or `buffer` field set to a value other than `VK_NULL_HANDLE`.
- If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, `allocationSize` **must** be the size returned by [vkGetAndroidHardwareBufferPropertiesANDROID](#) for the Android hardware buffer.
- If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, and the `pNext` chain does not contain an instance of [VkMemoryDedicatedAllocateInfo](#) or [VkMemoryDedicatedAllocateInfo::image](#) is `VK_NULL_HANDLE`, the Android hardware buffer **must** have a `AHardwareBuffer_Desc::format` of `AHARDWAREBUFFER_FORMAT_BLOB` and a `AHardwareBuffer_Desc::usage` that includes `AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER`.
- If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, `memoryTypeIndex` **must** be one of those returned by [vkGetAndroidHardwareBufferPropertiesANDROID](#) for the Android hardware buffer.
- If the parameters do not define an import operation, and the `pNext` chain contains an instance of [VkExportMemoryAllocateInfo](#) with `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID` included in its `handleTypes` member, and the `pNext` contains an instance of [VkMemoryDedicatedAllocateInfo](#) with `image` not equal to `VK_NULL_HANDLE`, then `allocationSize` **must** be `0`, otherwise `allocationSize` **must** be greater than `0`.
- If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes an instance of [VkMemoryDedicatedAllocateInfo](#) with `image` that is not `VK_NULL_HANDLE`, the Android hardware buffer's [AHardwareBuffer](#)

`::usage` **must** include at least one of `AHARDWAREBUFFER_USAGE_GPU_COLOR_OUTPUT` or `AHARDWAREBUFFER_USAGE_GPU_SAMPLED_IMAGE`.

- If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes an instance of `VkMemoryDedicatedAllocateInfo` with `image` that is not `VK_NULL_HANDLE`, the format of `image` **must** be `VK_FORMAT_UNDEFINED` or the format returned by `vkGetAndroidHardwareBufferPropertiesANDROID` in `VkAndroidHardwareBufferFormatPropertiesANDROID::format` for the Android hardware buffer.
- If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes an instance of `VkMemoryDedicatedAllocateInfo` with `image` that is not `VK_NULL_HANDLE`, the width, height, and array layer dimensions of `image` and the Android hardware buffer's `AHardwareBuffer_Desc` **must** be identical.
- If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes an instance of `VkMemoryDedicatedAllocateInfo` with `image` that is not `VK_NULL_HANDLE`, and the Android hardware buffer's `AHardwareBuffer::usage` includes `AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE`, the `image` **must** have a complete mipmap chain.
- If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes an instance of `VkMemoryDedicatedAllocateInfo` with `image` that is not `VK_NULL_HANDLE`, and the Android hardware buffer's `AHardwareBuffer::usage` does not include `AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE`, the `image` **must** have exactly one mipmap level.
- If the parameters define an import operation, the external handle is an Android hardware buffer, and the `pNext` chain includes an instance of `VkMemoryDedicatedAllocateInfo` with `image` that is not `VK_NULL_HANDLE`, each bit set in the usage of `image` **must** be listed in `AHardwareBuffer Usage Equivalence`, and if there is a corresponding `AHARDWAREBUFFER_USAGE` bit listed that bit **must** be included in the Android hardware buffer's `AHardwareBuffer_Desc::usage`.
- If `VkMemoryOpaqueCaptureAddressAllocateInfoKHR::opaqueCaptureAddress` is not zero, `VkMemoryAllocateFlagsInfo::flags` **must** include `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`
- If `VkMemoryAllocateFlagsInfo::flags` includes `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`, the `bufferDeviceAddressCaptureReplay` feature **must** be enabled
- If `VkMemoryAllocateFlagsInfo::flags` includes `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT_KHR`, the `bufferDeviceAddress` feature **must** be enabled
- If the `pNext` chain contains an instance of `VkImportMemoryHostPointerInfoEXT`, `VkMemoryOpaqueCaptureAddressAllocateInfoKHR::opaqueCaptureAddress` **must** be zero
- If the parameters define an import operation, `VkMemoryOpaqueCaptureAddressAllocateInfoKHR::opaqueCaptureAddress` **must** be zero

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDedicatedAllocationMemoryAllocateInfoNV`,  
`VkExportMemoryAllocateInfo`,  
`VkExportMemoryAllocateInfoNV`,  
`VkExportMemoryWin32HandleInfoKHR`,  
`VkExportMemoryWin32HandleInfoNV`,  
`VkImportAndroidHardwareBufferInfoANDROID`,  
`VkImportMemoryFdInfoKHR`,  
`VkImportMemoryHostPointerInfoEXT`,  
`VkImportMemoryWin32HandleInfoKHR`,  
`VkImportMemoryWin32HandleInfoNV`,  
`VkMemoryAllocateFlagsInfo`,  
`VkMemoryDedicatedAllocateInfo`, `VkMemoryOpaqueCaptureAddressAllocateInfoKHR`, or  
`VkMemoryPriorityAllocateInfoEXT`
- Each `sType` member in the `pNext` chain must be unique

If the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure, then that structure includes a handle of the sole buffer or image resource that the memory can be bound to.

The `VkMemoryDedicatedAllocateInfo` structure is defined as:

```
typedef struct VkMemoryDedicatedAllocateInfo {  
    VkStructureType    sType;  
    const void*        pNext;  
    VkImage            image;  
    VkBuffer           buffer;  
} VkMemoryDedicatedAllocateInfo;
```

or the equivalent

```
typedef VkMemoryDedicatedAllocateInfo VkMemoryDedicatedAllocateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `image` is `VK_NULL_HANDLE` or a handle of an image which this memory will be bound to.
- `buffer` is `VK_NULL_HANDLE` or a handle of a buffer which this memory will be bound to.

## Valid Usage

- At least one of `image` and `buffer` **must** be `VK_NULL_HANDLE`
- If `image` is not `VK_NULL_HANDLE`, `VkMemoryAllocateInfo::allocationSize` **must** equal the `VkMemoryRequirements::size` of the image
- If `image` is not `VK_NULL_HANDLE`, `image` **must** have been created without `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` set in `VkImageCreateInfo::flags`
- If `buffer` is not `VK_NULL_HANDLE`, `VkMemoryAllocateInfo::allocationSize` **must** equal the `VkMemoryRequirements::size` of the buffer
- If `buffer` is not `VK_NULL_HANDLE`, `buffer` **must** have been created without `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` set in `VkBufferCreateInfo::flags`
- If `image` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation with handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`,  
`VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`,  
`VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`,  
`VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, or  
`VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, and the external handle was created by the Vulkan API, then the memory being imported **must** also be a dedicated image allocation and `image` must be identical to the image associated with the imported memory.
- If `buffer` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation with handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`,  
`VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`,  
`VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`,  
`VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, or  
`VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, and the external handle was created by the Vulkan API, then the memory being imported **must** also be a dedicated buffer allocation and `buffer` must be identical to the buffer associated with the imported memory.
- If `image` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation with handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT`, the memory being imported **must** also be a dedicated image allocation and `image` must be identical to the image associated with the imported memory.
- If `buffer` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation with handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT`, the memory being imported **must** also be a dedicated buffer allocation and `buffer` must be identical to the buffer associated with the imported memory.
- If `image` is not `VK_NULL_HANDLE`, `image` **must** not have been created with `VK_IMAGE_CREATE_DISJOINT_BIT` set in `VkImageCreateInfo::flags`

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO`
- If `image` is not `VK_NULL_HANDLE`, `image` must be a valid `VkImage` handle
- If `buffer` is not `VK_NULL_HANDLE`, `buffer` must be a valid `VkBuffer` handle
- Both of `buffer`, and `image` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

If the `pNext` chain includes a `VkDedicatedAllocationMemoryAllocateInfoNV` structure, then that structure includes a handle of the sole buffer or image resource that the memory can be bound to.

The `VkDedicatedAllocationMemoryAllocateInfoNV` structure is defined as:

```
typedef struct VkDedicatedAllocationMemoryAllocateInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    VkImage            image;
    VkBuffer           buffer;
} VkDedicatedAllocationMemoryAllocateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `image` is `VK_NULL_HANDLE` or a handle of an image which this memory will be bound to.
- `buffer` is `VK_NULL_HANDLE` or a handle of a buffer which this memory will be bound to.

## Valid Usage

- At least one of `image` and `buffer` **must** be `VK_NULL_HANDLE`
- If `image` is not `VK_NULL_HANDLE`, the image **must** have been created with `VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation` equal to `VK_TRUE`
- If `buffer` is not `VK_NULL_HANDLE`, the buffer **must** have been created with `VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation` equal to `VK_TRUE`
- If `image` is not `VK_NULL_HANDLE`, `VkMemoryAllocateInfo::allocationSize` **must** equal the `VkMemoryRequirements::size` of the image
- If `buffer` is not `VK_NULL_HANDLE`, `VkMemoryAllocateInfo::allocationSize` **must** equal the `VkMemoryRequirements::size` of the buffer
- If `image` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation, the memory being imported **must** also be a dedicated image allocation and `image` **must** be identical to the image associated with the imported memory.
- If `buffer` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation, the memory being imported **must** also be a dedicated buffer allocation and `buffer` **must** be identical to the buffer associated with the imported memory.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPEDEDICATED_ALLOCATION_MEMORY_ALLOCATE_INFO_NV`
- If `image` is not `VK_NULL_HANDLE`, `image` **must** be a valid `VkImage` handle
- If `buffer` is not `VK_NULL_HANDLE`, `buffer` **must** be a valid `VkBuffer` handle
- Both of `buffer`, and `image` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

If the `pNext` chain includes a `VkMemoryPriorityAllocateInfoEXT` structure, then that structure includes a priority for the memory.

The `VkMemoryPriorityAllocateInfoEXT` structure is defined as:

```
typedef struct VkMemoryPriorityAllocateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    float              priority;
} VkMemoryPriorityAllocateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `priority` is a floating-point value between `0` and `1`, indicating the priority of the allocation relative to other memory allocations. Larger values are higher priority. The granularity of the

priorities is implementation-dependent.

Memory allocations with higher priority **may** be more likely to stay in device-local memory when the system is under memory pressure.

If this structure is not included, it is as if the `priority` value were `0.5`.

## Valid Usage

- `priority` **must** be between `0` and `1`, inclusive

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_PRIORITY_ALLOCATE_INFO_EXT`

When allocating memory that **may** be exported to another process or Vulkan instance, add a `VkExportMemoryAllocateInfo` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure, specifying the handle types that **may** be exported.

The `VkExportMemoryAllocateInfo` structure is defined as:

```
typedef struct VkExportMemoryAllocateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExportMemoryAllocateInfo;
```

or the equivalent

```
typedef VkExportMemoryAllocateInfo VkExportMemoryAllocateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `handleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more memory handle types the application **can** export from the resulting allocation. The application **can** request multiple handle types for the same allocation.

## Valid Usage

- The bits in `handleTypes` **must** be supported and compatible, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO`
- `handleTypes` **must** be a valid combination of `VkExternalMemoryHandleTypeFlagBits` values

To specify additional attributes of NT handles exported from a memory object, add the `VkExportMemoryWin32HandleInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkExportMemoryWin32HandleInfoKHR` structure is defined as:

```
typedef struct VkExportMemoryWin32HandleInfoKHR {
    VkStructureType          sType;
    const void*               pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD                    dwAccess;
    LPCWSTR                  name;
} VkExportMemoryWin32HandleInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- `dwAccess` is a `DWORD` specifying access rights of the handle.
- `name` is a null-terminated UTF-16 string to associate with the underlying resource referenced by NT handles exported from the created memory.

If this structure is not present, or if `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”<sup>1</sup>. Further, if the structure is not present, the access rights used depend on the handle type.

For handles of the following types:

`VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`  
`VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`

The implementation **must** ensure the access rights allow read and write access to the memory.

For handles of the following types:

`VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT` `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`

The access rights **must** be:

`GENERIC_ALL`

<https://docs.microsoft.com/en-us/windows/win32/sync/synchronization-object-security-and-access-rights>

## Valid Usage

- If `VkExportMemoryAllocateInfo::handleTypes` does not include `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, `VkExportMemoryWin32HandleInfoKHR` **must** not be in the `pNext` chain of `VkMemoryAllocateInfo`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_KHR`
- If `pAttributes` is not `NULL`, `pAttributes` **must** be a valid pointer to a valid `SECURITY_ATTRIBUTES` value

To import memory from a Windows handle, add a `VkImportMemoryWin32HandleInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure.

The `VkImportMemoryWin32HandleInfoKHR` structure is defined as:

```
typedef struct VkImportMemoryWin32HandleInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    HANDLE                   handle;
    LPCWSTR                  name;
} VkImportMemoryWin32HandleInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `handleType` specifies the type of `handle` or `name`.
- `handle` is the external handle to import, or `NULL`.
- `name` is a null-terminated UTF-16 string naming the underlying memory resource to import, or `NULL`.

Importing memory objects from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application **must** release ownership using the `CloseHandle` system call when the handle is no longer needed.

Applications **can** import the same underlying memory into multiple instances of Vulkan, into the

same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation **must** create a distinct `VkDeviceMemory` object.

## Valid Usage

- If `handleType` is not `0`, it **must** be supported for import, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`.
- The memory from which `handle` was exported, or the memory named by `name` **must** have been created on the same underlying physical device as `device`.
- If `handleType` is not `0`, it **must** be defined as an NT handle or a global share handle.
- If `handleType` is not `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, `name` **must** be `NULL`.
- If `handleType` is not `0` and `handle` is `NULL`, `name` **must** name a valid memory resource of the type specified by `handleType`.
- If `handleType` is not `0` and `name` is `NULL`, `handle` **must** be a valid handle of the type specified by `handleType`.
- If `handle` is not `NULL`, `name` must be `NULL`.
- If `handle` is not `NULL`, it **must** obey any requirements listed for `handleType` in [external memory handle types compatibility](#).
- If `name` is not `NULL`, it **must** obey any requirements listed for `handleType` in [external memory handle types compatibility](#).

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_KHR`
- If `handleType` is not `0`, `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

To export a Windows handle representing the underlying resources of a Vulkan device memory object, call:

```
VkResult vkGetMemoryWin32HandleKHR(  
    VkDevice                               device,  
    const VkMemoryGetWin32HandleInfoKHR* pGetWin32HandleInfo,  
    HANDLE*                                pHandle);
```

- `device` is the logical device that created the device memory being exported.
- `pGetWin32HandleInfo` is a pointer to a `VkMemoryGetWin32HandleInfoKHR` structure containing parameters of the export operation.

- `pHandle` will return the Windows handle representing the underlying resources of the device memory object.

For handle types defined as NT handles, the handles returned by `vkGetMemoryWin32HandleKHR` are owned by the application. To avoid leaking resources, the application **must** release ownership of them using the `CloseHandle` system call when they are no longer needed.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pGetWin32HandleInfo` **must** be a valid pointer to a valid `VkMemoryGetWin32HandleInfoKHR` structure
- `pHandle` **must** be a valid pointer to a `HANDLE` value

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkMemoryGetWin32HandleInfoKHR` structure is defined as:

```
typedef struct VkMemoryGetWin32HandleInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkDeviceMemory             memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetWin32HandleInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `memory` is the memory object from which the handle will be exported.
- `handleType` is the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalMemoryHandleTypeFlagBits` for a description of the properties of the defined external memory handle types.

## Valid Usage

- `handleType` **must** have been included in `VkExportMemoryAllocateInfo::handleTypes` when `memory` was created.
- If `handleType` is defined as an NT handle, `vkGetMemoryWin32HandleKHR` **must** be called no more than once for each valid unique combination of `memory` and `handleType`.
- `handleType` **must** be defined as an NT handle or a global share handle.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_GET_WIN32_HANDLE_INFO_KHR`
- `pNext` **must** be `NULL`
- `memory` **must** be a valid `VkDeviceMemory` handle
- `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

Windows memory handles compatible with Vulkan **may** also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```
VkResult vkGetMemoryWin32HandlePropertiesKHR(  
    VkDevice                                     device,  
    VkExternalMemoryHandleTypeFlagBits           handleType,  
    HANDLE                                       handle,  
    VkMemoryWin32HandlePropertiesKHR*            pMemoryWin32HandleProperties);
```

- `device` is the logical device that will be importing `handle`.
- `handleType` is the type of the handle `handle`.
- `handle` is the handle which will be imported.
- `pMemoryWin32HandleProperties` will return properties of `handle`.

## Valid Usage

- `handle` **must** be an external memory handle created outside of the Vulkan API.
- `handleType` **must** not be one of the handle types defined as opaque.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value
- `pMemoryWin32HandleProperties` **must** be a valid pointer to a `VkMemoryWin32HandlePropertiesKHR` structure

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkMemoryWin32HandlePropertiesKHR` structure returned is defined as:

```
typedef struct VkMemoryWin32HandlePropertiesKHR {
    VkStructureType sType;
    void*           pNext;
    uint32_t         memoryTypeBits;
} VkMemoryWin32HandlePropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified windows handle **can** be imported as.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_WIN32_HANDLE_PROPERTIES_KHR`
- `pNext` **must** be `NULL`

To import memory from a POSIX file descriptor handle, add a `VkImportMemoryFdInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkImportMemoryFdInfoKHR` structure is defined as:

```

typedef struct VkImportMemoryFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    int fd;
} VkImportMemoryFdInfoKHR;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **handleType** specifies the handle type of **fd**.
- **fd** is the external handle to import.

Importing memory from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application **must** not perform any operations on the file descriptor after a successful import.

Applications **can** import the same underlying memory into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation **must** create a distinct **VkDeviceMemory** object.

## Valid Usage

- If **handleType** is not **0**, it **must** be supported for import, as reported by **VkExternalImageFormatProperties** or **VkExternalBufferProperties**.
- The memory from which **fd** was exported **must** have been created on the same underlying physical device as **device**.
- If **handleType** is not **0**, it **must** be defined as a POSIX file descriptor handle.
- If **handleType** is not **0**, **fd** **must** be a valid handle of the type specified by **handleType**.
- The memory represented by **fd** **must** have been created from a physical device and driver that is compatible with **device** and **handleType**, as described in [External memory handle types compatibility](#).
- **fd** **must** obey any requirements listed for **handleType** in [external memory handle types compatibility](#).

## Valid Usage (Implicit)

- **sType** **must** be **VK\_STRUCTURE\_TYPE\_IMPORT\_MEMORY\_FD\_INFO\_KHR**
- If **handleType** is not **0**, **handleType** **must** be a valid **VkExternalMemoryHandleTypeFlagBits** value

To export a POSIX file descriptor representing the underlying resources of a Vulkan device memory object, call:

```

VkResult vkGetMemoryFdKHR(
    VkDevice device,
    const VkMemoryGetFdInfoKHR* pGetFdInfo,
    int* pFd);

```

- `device` is the logical device that created the device memory being exported.
- `pGetFdInfo` is a pointer to a `VkMemoryGetFdInfoKHR` structure containing parameters of the export operation.
- `pFd` will return a file descriptor representing the underlying resources of the device memory object.

Each call to `vkGetMemoryFdKHR` **must** create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application **must** release ownership of the file descriptor using the `close` system call when it is no longer needed, or by importing a Vulkan memory object from it. Where supported by the operating system, the implementation **must** set the file descriptor to be closed automatically when an `execve` system call is made.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pGetFdInfo` **must** be a valid pointer to a valid `VkMemoryGetFdInfoKHR` structure
- `pFd` **must** be a valid pointer to an `int` value

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkMemoryGetFdInfoKHR` structure is defined as:

```

typedef struct VkMemoryGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetFdInfoKHR;

```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.

- `memory` is the memory object from which the handle will be exported.
- `handleType` is the type of handle requested.

The properties of the file descriptor exported depend on the value of `handleType`. See `VkExternalMemoryHandleTypeFlagBits` for a description of the properties of the defined external memory handle types.

*Note*

The size of the exported file **may** be larger than the size requested by `VkMemoryAllocateInfo::allocationSize`. If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT`, then the application **can** query the file's actual size with `lseek(2)`.

## Valid Usage

- `handleType` **must** have been included in `VkExportMemoryAllocateInfo::handleTypes` when `memory` was created.
- `handleType` **must** be defined as a POSIX file descriptor handle.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_GET_FD_INFO_KHR`
- `pNext` **must** be `NULL`
- `memory` **must** be a valid `VkDeviceMemory` handle
- `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

POSIX file descriptor memory handles compatible with Vulkan **may** also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```
VkResult vkGetMemoryFdPropertiesKHR(
    VkDevice                                     device,
    VkExternalMemoryHandleTypeFlagBits           handleType,
    int                                           fd,
    VkMemoryFdPropertiesKHR*                    pMemoryFdProperties);
```

- `device` is the logical device that will be importing `fd`.
- `handleType` is the type of the handle `fd`.
- `fd` is the handle which will be imported.
- `pMemoryFdProperties` is a pointer to a `VkMemoryFdPropertiesKHR` structure in which the properties of the handle `fd` are returned.

## Valid Usage

- `fd` **must** be an external memory handle created outside of the Vulkan API.
- `handleType` **must** not be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT_KHR`.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value
- `pMemoryFdProperties` **must** be a valid pointer to a `VkMemoryFdPropertiesKHR` structure

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkMemoryFdPropertiesKHR` structure returned is defined as:

```
typedef struct VkMemoryFdPropertiesKHR {
    VkStructureType    sType;
    void*              pNext;
    uint32_t           memoryTypeBits;
} VkMemoryFdPropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified file descriptor **can** be imported as.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_FD_PROPERTIES_KHR`
- `pNext` **must** be `NULL`

To import memory from a host pointer, add a `VkImportMemoryHostPointerInfoEXT` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkImportMemoryHostPointerInfoEXT` structure is defined as:

```

typedef struct VkImportMemoryHostPointerInfoEXT {
    VkStructureType           sType;
    const void*              pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    void*                  pHostPointer;
} VkImportMemoryHostPointerInfoEXT;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **handleType** specifies the handle type.
- **pHostPointer** is the host pointer to import from.

Importing memory from a host pointer shares ownership of the memory between the host and the Vulkan implementation. The application **can** continue to access the memory through the host pointer but it is the application's responsibility to synchronize device and non-device access to the underlying memory as defined in [Host Access to Device Memory Objects](#).

Applications **can** import the same underlying memory into multiple instances of Vulkan and multiple times into a given Vulkan instance. However, implementations **may** fail to import the same underlying memory multiple times into a given physical device due to platform constraints.

Importing memory from a particular host pointer **may** not be possible due to additional platform-specific restrictions beyond the scope of this specification in which case the implementation **must** fail the memory import operation with the error code **VK\_ERROR\_INVALID\_EXTERNAL\_HANDLE\_KHR**.

The application **must** ensure that the imported memory range remains valid and accessible for the lifetime of the imported memory object.

## Valid Usage

- If **handleType** is not **0**, it **must** be supported for import, as reported in [VkExternalMemoryProperties](#)
- If **handleType** is not **0**, it **must** be **VK\_EXTERNAL\_MEMORY\_HANDLE\_TYPE\_HOST\_ALLOCATION\_BIT\_EXT** or **VK\_EXTERNAL\_MEMORY\_HANDLE\_TYPE\_HOST\_MAPPED\_FOREIGN\_MEMORY\_BIT\_EXT**
- **pHostPointer** **must** be a pointer aligned to an integer multiple of [VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment](#)
- If **handleType** is **VK\_EXTERNAL\_MEMORY\_HANDLE\_TYPE\_HOST\_ALLOCATION\_BIT\_EXT**, **pHostPointer** **must** be a pointer to **allocationSize** number of bytes of host memory, where **allocationSize** is the member of the [VkMemoryAllocateInfo](#) structure this structure is chained to
- If **handleType** is **VK\_EXTERNAL\_MEMORY\_HANDLE\_TYPE\_HOST\_MAPPED\_FOREIGN\_MEMORY\_BIT\_EXT**, **pHostPointer** **must** be a pointer to **allocationSize** number of bytes of host mapped foreign memory, where **allocationSize** is the member of the [VkMemoryAllocateInfo](#) structure this structure is chained to

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_HOST_POINTER_INFO_EXT`
- `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value

To determine the correct parameters to use when importing host pointers, call:

```
VkResult vkGetMemoryHostPointerPropertiesEXT(  
    VkDevice                                     device,  
    VkExternalMemoryHandleTypeFlagBits           handleType,  
    const void*                                    pHostPointer,  
    VkMemoryHostPointerPropertiesEXT*            pMemoryHostPointerProperties);
```

- `device` is the logical device that will be importing `pHostPointer`.
- `handleType` is the type of the handle `pHostPointer`.
- `pHostPointer` is the host pointer to import from.
- `pMemoryHostPointerProperties` is a pointer to a `VkMemoryHostPointerPropertiesEXT` structure in which the host pointer properties are returned.

## Valid Usage

- `handleType` **must** be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`
- `pHostPointer` **must** be a pointer aligned to an integer multiple of `VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment`
- If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT`, `pHostPointer` **must** be a pointer to host memory
- If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`, `pHostPointer` **must** be a pointer to host mapped foreign memory

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value
- `pMemoryHostPointerProperties` **must** be a valid pointer to a `VkMemoryHostPointerPropertiesEXT` structure

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkMemoryHostPointerPropertiesEXT` structure is defined as:

```
typedef struct VkMemoryHostPointerPropertiesEXT {
    VkStructureType    sType;
    void*             pNext;
    uint32_t          memoryTypeBits;
} VkMemoryHostPointerPropertiesEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified host pointer **can** be imported as.

The value returned by `memoryTypeBits` **must** only include bits that identify memory types which are host visible.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_HOST_POINTER_PROPERTIES_EXT`
- `pNext` **must** be `NULL`

To import memory created outside of the current Vulkan instance from an Android hardware buffer, add a `VkImportAndroidHardwareBufferInfoANDROID` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkImportAndroidHardwareBufferInfoANDROID` structure is defined as:

```
typedef struct VkImportAndroidHardwareBufferInfoANDROID {
    VkStructureType          sType;
    const void*              pNext;
    struct AHardwareBuffer*   buffer;
} VkImportAndroidHardwareBufferInfoANDROID;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `buffer` is the Android hardware buffer to import.

If the `vkAllocateMemory` command succeeds, the implementation **must** acquire a reference to the imported hardware buffer, which it **must** release when the device memory object is freed. If the command fails, the implementation **must** not retain a reference.

## Valid Usage

- If `buffer` is not `NULL`, Android hardware buffers **must** be supported for import, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`.
- If `buffer` is not `NULL`, it **must** be a valid Android hardware buffer object with `AHardwareBuffer_Desc::format` and `AHardwareBuffer_Desc::usage` compatible with Vulkan as described in [Android Hardware Buffers](#).

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_ANDROID_HARDWARE_BUFFER_INFO_ANDROID`
- `buffer` **must** be a valid pointer to an `AHardwareBuffer` value

To export an Android hardware buffer representing the underlying resources of a Vulkan device memory object, call:

```
VkResult vkGetMemoryAndroidHardwareBufferANDROID(  
    VkDevice                         device,  
    const VkMemoryGetAndroidHardwareBufferInfoANDROID* pInfo,  
    struct AHardwareBuffer**          pBuffer);
```

- `device` is the logical device that created the device memory being exported.
- `pInfo` is a pointer to a `VkMemoryGetAndroidHardwareBufferInfoANDROID` structure containing parameters of the export operation.
- `pBuffer` will return an Android hardware buffer representing the underlying resources of the device memory object.

Each call to `vkGetMemoryAndroidHardwareBufferANDROID` **must** return an Android hardware buffer with a new reference acquired in addition to the reference held by the `VkDeviceMemory`. To avoid leaking resources, the application **must** release the reference by calling `AHardwareBuffer_release` when it is no longer needed. When called with the same handle in `VkMemoryGetAndroidHardwareBufferInfoANDROID::memory`, `vkGetMemoryAndroidHardwareBufferANDROID` **must** return the same Android hardware buffer object. If the device memory was created by importing an Android hardware buffer, `vkGetMemoryAndroidHardwareBufferANDROID` **must** return that same Android hardware buffer object.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pInfo` **must** be a valid pointer to a valid `VkMemoryGetAndroidHardwareBufferInfoANDROID` structure
- `pBuffer` **must** be a valid pointer to a valid pointer to an `AHardwareBuffer` value

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkMemoryGetAndroidHardwareBufferInfoANDROID` structure is defined as:

```
typedef struct VkMemoryGetAndroidHardwareBufferInfoANDROID {
    VkStructureType    sType;
    const void*        pNext;
    VkDeviceMemory     memory;
} VkMemoryGetAndroidHardwareBufferInfoANDROID;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `memory` is the memory object from which the Android hardware buffer will be exported.

## Valid Usage

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID` **must** have been included in `VkExportMemoryAllocateInfo::handleTypes` when `memory` was created.
- If the `pNext` chain of the `VkMemoryAllocateInfo` used to allocate `memory` included a `VkMemoryDedicatedAllocateInfo` with non-`NULL` `image` member, then that `image` **must** already be bound to `memory`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_GET_ANDROID_HARDWARE_BUFFER_INFO_ANDROID`
- `pNext` **must** be `NULL`
- `memory` **must** be a valid `VkDeviceMemory` handle

To determine the memory parameters to use when importing an Android hardware buffer, call:

```
VkResult vkGetAndroidHardwareBufferPropertiesANDROID(  
    VkDevice device,  
    const struct AHardwareBuffer* buffer,  
    VkAndroidHardwareBufferPropertiesANDROID* pProperties);
```

- `device` is the logical device that will be importing `buffer`.
- `buffer` is the Android hardware buffer which will be imported.
- `pProperties` is a pointer to a `VkAndroidHardwareBufferPropertiesANDROID` structure in which the properties of `buffer` are returned.

## Valid Usage

- `buffer` **must** be a valid Android hardware buffer object with at least one of the `AHARDWAREBUFFER_USAGE_GPU_*` flags in its `AHardwareBuffer_Desc::usage`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `buffer` **must** be a valid pointer to a valid `AHardwareBuffer` value
- `pProperties` **must** be a valid pointer to a `VkAndroidHardwareBufferPropertiesANDROID` structure

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR`

The `VkAndroidHardwareBufferPropertiesANDROID` structure returned is defined as:

```

typedef struct VkAndroidHardwareBufferPropertiesANDROID {
    VkStructureType      sType;
    void*              pNext;
    VkDeviceSize         allocationSize;
    uint32_t             memoryTypeBits;
} VkAndroidHardwareBufferPropertiesANDROID;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **allocationSize** is the size of the external memory
- **memoryTypeBits** is a bitmask containing one bit set for every memory type which the specified Android hardware buffer **can** be imported as.

### Valid Usage (Implicit)

- **sType** **must** be `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_PROPERTIES_ANDROID`
- **pNext** **must** be **NULL** or a pointer to a valid instance of `VkAndroidHardwareBufferFormatPropertiesANDROID`

To obtain format properties of an Android hardware buffer, include an instance of `VkAndroidHardwareBufferFormatPropertiesANDROID` in the **pNext** chain of the `VkAndroidHardwareBufferPropertiesANDROID` instance passed to `vkGetAndroidHardwareBufferPropertiesANDROID`. This structure is defined as:

```

typedef struct VkAndroidHardwareBufferFormatPropertiesANDROID {
    VkStructureType          sType;
    void*                  pNext;
    VkFormat                format;
    uint64_t                externalFormat;
    VkFormatFeatureFlags    formatFeatures;
    VkComponentMapping       samplerYcbcrConversionComponents;
    VkSamplerYcbcrModelConversion suggestedYcbcrModel;
    VkSamplerYcbcrRange     suggestedYcbcrRange;
    VkChromaLocation        suggestedXChromaOffset;
    VkChromaLocation        suggestedYChromaOffset;
} VkAndroidHardwareBufferFormatPropertiesANDROID;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **format** is the Vulkan format corresponding to the Android hardware buffer's format, or `VK_FORMAT_UNDEFINED` if there is not an equivalent Vulkan format.
- **externalFormat** is an implementation-defined external format identifier for use with `VkExternalFormatANDROID`. It **must** not be zero.

- `formatFeatures` describes the capabilities of this external format when used with an image bound to memory imported from `buffer`.
- `samplerYcbcrConversionComponents` is the component swizzle that **should** be used in `VkSamplerYcbcrConversionCreateInfo`.
- `suggestedYcbcrModel` is a suggested color model to use in the `VkSamplerYcbcrConversionCreateInfo`.
- `suggestedYcbcrRange` is a suggested numerical value range to use in `VkSamplerYcbcrConversionCreateInfo`.
- `suggestedXChromaOffset` is a suggested X chroma offset to use in `VkSamplerYcbcrConversionCreateInfo`.
- `suggestedYChromaOffset` is a suggested Y chroma offset to use in `VkSamplerYcbcrConversionCreateInfo`.

If the Android hardware buffer has one of the formats listed in the [Format Equivalence table](#), then `format` **must** have the equivalent Vulkan format listed in the table. Otherwise, `format` **may** be `VK_FORMAT_UNDEFINED`, indicating the Android hardware buffer **can** only be used with an external format.

The `formatFeatures` member **must** include `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` and at least one of `VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT` or `VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT`, and **should** include `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT`.

*Note*

The `formatFeatures` member only indicates the features available when using an [external-format image](#) created from the Android hardware buffer. Images from Android hardware buffers with a format other than `VK_FORMAT_UNDEFINED` are subject to the format capabilities obtained from `vkGetPhysicalDeviceFormatProperties2` and `vkGetPhysicalDeviceImageFormatProperties2` with appropriate parameters. These sets of features are independent of each other, e.g. the external format will support sampler Y'CbCr conversion even if the non-external format does not, and writing to non-external format images is possible but writing to external format images is not.

Android hardware buffers with the same external format **must** have the same support for `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`, `VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT`, `VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT`, `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT`, `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT`, and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT` in `formatFeatures`. Other format features **may** differ between Android hardware buffers that have the same external format. This allows applications to use the same `VkSamplerYcbcrConversion` object (and samplers and pipelines created from them) for any Android hardware buffers that have the same external format.

If `format` is not `VK_FORMAT_UNDEFINED`, then the value of `samplerYcbcrConversionComponents` **must** be valid when used as the `components` member of `VkSamplerYcbcrConversionCreateInfo` with that format. If `format` is `VK_FORMAT_UNDEFINED`, all members of `samplerYcbcrConversionComponents` **must** be `VK_COMPONENT_SWIZZLE_IDENTITY`.

Implementations **may** not always be able to determine the color model, numerical range, or chroma offsets of the image contents, so the values in `VkAndroidHardwareBufferFormatPropertiesANDROID` are only suggestions. Applications **should** treat these values as sensible defaults to use in the absence of more reliable information obtained through some other means. If the underlying physical device is also usable via OpenGL ES with the `GL_OES_EGL_image_external` extension, the implementation **should** suggest values that will produce similar sampled values as would be obtained by sampling the same external image via `samplerExternalOES` in OpenGL ES using equivalent sampler parameters.

*Note*

Since `GL_OES_EGL_image_external` does not require the same sampling and conversion calculations as Vulkan does, achieving identical results between APIs **may** not be possible on some implementations.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_FORMAT_PROPERTIES_ANDROID`

When allocating memory that **may** be exported to another process or Vulkan instance, add a `VkExportMemoryAllocateInfoNV` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure, specifying the handle types that **may** be exported.

The `VkExportMemoryAllocateInfoNV` structure is defined as:

```
typedef struct VkExportMemoryAllocateInfoNV {
    VkStructureType             sType;
    const void*                 pNext;
    VkExternalMemoryHandleTypeFlagsNV handleTypes;
} VkExportMemoryAllocateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `handleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBitsNV` specifying one or more memory handle types that **may** be exported. Multiple handle types **may** be requested for the same allocation as long as they are compatible, as reported by `vkGetPhysicalDeviceExternalImageFormatPropertiesNV`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO_NV`
- `handleTypes` **must** be a valid combination of `VkExternalMemoryHandleTypeFlagBitsNV` values

When `VkExportMemoryAllocateInfoNV::handleTypes` includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV`, add a `VkExportMemoryWin32HandleInfoNV` to the `pNext` chain of the `VkExportMemoryAllocateInfoNV` structure to specify security attributes and access rights for the memory object's external handle.

The `VkExportMemoryWin32HandleInfoNV` structure is defined as:

```
typedef struct VkExportMemoryWin32HandleInfoNV {
    VkStructureType           sType;
    const void*               pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD                     dwAccess;
} VkExportMemoryWin32HandleInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- `dwAccess` is a `DWORD` specifying access rights of the handle.

If this structure is not present, or if `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”<sup>1</sup>. Further, if the structure is not present, the access rights will be

`DXGI_SHARED_RESOURCE_READ | DXGI_SHARED_RESOURCE_WRITE`

1

<https://docs.microsoft.com/en-us/windows/win32/sync/synchronization-object-security-and-access-rights>

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_NV`
- If `pAttributes` is not `NULL`, `pAttributes` **must** be a valid pointer to a valid `SECURITY_ATTRIBUTES` value

To import memory created on the same physical device but outside of the current Vulkan instance,

add a `VkImportMemoryWin32HandleInfoNV` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure, specifying a handle to and the type of the memory.

The `VkImportMemoryWin32HandleInfoNV` structure is defined as:

```
typedef struct VkImportMemoryWin32HandleInfoNV {
    VkStructureType           sType;
    const void*               pNext;
    VkExternalMemoryHandleTypeFlagsNV handleType;
    HANDLE                   handle;
} VkImportMemoryWin32HandleInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `handleType` is `0` or a `VkExternalMemoryHandleTypeFlagBitsNV` value specifying the type of memory handle in `handle`.
- `handle` is a Windows `HANDLE` referring to the memory.

If `handleType` is `0`, this structure is ignored by consumers of the `VkMemoryAllocateInfo` structure it is chained from.

## Valid Usage

- `handleType` **must** not have more than one bit set.
- `handle` **must** be a valid handle to memory, obtained as specified by `handleType`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_NV`
- `handleType` **must** be a valid combination of `VkExternalMemoryHandleTypeFlagBitsNV` values

Bits which **can** be set in `handleType` are:

Possible values of `VkImportMemoryWin32HandleInfoNV::handleType`, specifying the type of an external memory handle, are:

```

typedef enum VkExternalMemoryHandleTypeFlagBitsNV {
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_NV = 0x00000001,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_NV = 0x00000002,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_BIT_NV = 0x00000004,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_IMAGE_KMT_BIT_NV = 0x00000008,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_FLAG_BITS_MAX_ENUM_NV = 0x7FFFFFFF
} VkExternalMemoryHandleTypeFlagBitsNV;

```

- **VK\_EXTERNAL\_MEMORY\_HANDLE\_TYPE\_OPAQUE\_WIN32\_KMT\_BIT\_NV** specifies a handle to memory returned by [vkGetMemoryWin32HandleNV](#).
- **VK\_EXTERNAL\_MEMORY\_HANDLE\_TYPE\_OPAQUE\_WIN32\_BIT\_NV** specifies a handle to memory returned by [vkGetMemoryWin32HandleNV](#), or one duplicated from such a handle using [DuplicateHandle\(\)](#).
- **VK\_EXTERNAL\_MEMORY\_HANDLE\_TYPE\_D3D11\_IMAGE\_BIT\_NV** specifies a valid NT handle to memory returned by [IDXGIResource1::CreateSharedHandle](#), or a handle duplicated from such a handle using [DuplicateHandle\(\)](#).
- **VK\_EXTERNAL\_MEMORY\_HANDLE\_TYPE\_D3D11\_IMAGE\_KMT\_BIT\_NV** specifies a handle to memory returned by [IDXGIResource::GetSharedHandle\(\)](#).

```
typedef VkFlags VkExternalMemoryHandleTypeFlagsNV;
```

**VkExternalMemoryHandleTypeFlagsNV** is a bitmask type for setting a mask of zero or more **VkExternalMemoryHandleTypeFlagBitsNV**.

To retrieve the handle corresponding to a device memory object created with [VkExportMemoryAllocateInfoNV::handleTypes](#) set to include **VK\_EXTERNAL\_MEMORY\_HANDLE\_TYPE\_OPAQUE\_WIN32\_BIT\_NV** or **VK\_EXTERNAL\_MEMORY\_HANDLE\_TYPE\_OPAQUE\_WIN32\_KMT\_BIT\_NV**, call:

```

VkResult vkGetMemoryWin32HandleNV(
    VkDevice device,
    VkDeviceMemory memory,
    VkExternalMemoryHandleTypeFlagsNV handleType,
    HANDLE* pHandle);

```

- **device** is the logical device that owns the memory.
- **memory** is the **VkDeviceMemory** object.
- **handleType** is a bitmask of **VkExternalMemoryHandleTypeFlagBitsNV** containing a single bit specifying the type of handle requested.
- **handle** is a pointer to a Windows **HANDLE** in which the handle is returned.

## Valid Usage

- `handleType` **must** be a flag specified in `VkExportMemoryAllocateInfoNV::handleTypes` when allocating `memory`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `memory` **must** be a valid `VkDeviceMemory` handle
- `handleType` **must** be a valid combination of `VkExternalMemoryHandleTypeFlagBitsNV` values
- `handleType` **must** not be `0`
- `pHandle` **must** be a valid pointer to a `HANDLE` value
- `memory` **must** have been created, allocated, or retrieved from `device`

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

If the `pNext` chain of `VkMemoryAllocateInfo` includes a `VkMemoryAllocateFlagsInfo` structure, then that structure includes flags and a device mask controlling how many instances of the memory will be allocated.

The `VkMemoryAllocateFlagsInfo` structure is defined as:

```
typedef struct VkMemoryAllocateFlagsInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkMemoryAllocateFlags    flags;
    uint32_t                 deviceMask;
} VkMemoryAllocateFlagsInfo;
```

or the equivalent

```
typedef VkMemoryAllocateFlagsInfo VkMemoryAllocateFlagsInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is a bitmask of `VkMemoryAllocateFlagBits` controlling the allocation.
- `deviceMask` is a mask of physical devices in the logical device, indicating that memory **must** be allocated on each device in the mask, if `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set in `flags`.

If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is not set, the number of instances allocated depends on whether `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is set in the memory heap. If `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is set, then memory is allocated for every physical device in the logical device (as if `deviceMask` has bits set for all device indices). If `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is not set, then a single instance of memory is allocated (as if `deviceMask` is set to one).

On some implementations, allocations from a multi-instance heap **may** consume memory on all physical devices even if the `deviceMask` excludes some devices. If `VkPhysicalDeviceGroupProperties::subsetAllocation` is `VK_TRUE`, then memory is only consumed for the devices in the device mask.

*Note*

In practice, most allocations on a multi-instance heap will be allocated across all physical devices. Unicast allocation support is an optional optimization for a minority of allocations.

## Valid Usage

- If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set, `deviceMask` **must** be a valid device mask.
- If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set, `deviceMask` **must** not be zero

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_FLAGS_INFO`
- `flags` **must** be a valid combination of `VkMemoryAllocateFlagBits` values

Bits which **can** be set in `VkMemoryAllocateFlagsInfo::flags`, controlling device memory allocation, are:

```
typedef enum VkMemoryAllocateFlagBits {
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT = 0x00000001,
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT_KHR = 0x00000002,
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = 0x00000004,
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT,
    VK_MEMORY_ALLOCATE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkMemoryAllocateFlagBits;
```

or the equivalent

```
typedef VkMemoryAllocateFlagBits VkMemoryAllocateFlagBitsKHR;
```

- `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` specifies that memory will be allocated for the devices in `VkMemoryAllocateFlagsInfo::deviceMask`.
- `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT_KHR` specifies that the memory **can** be attached to a buffer object created with the `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_KHR` bit set in `usage`, and that the memory handle **can** be used to retrieve an opaque address via `vkGetDeviceMemoryOpaqueCaptureAddressKHR`.
- `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR` specifies that the memory's address **can** be saved and reused on a subsequent run (e.g. for trace capture and replay), see `VkBufferOpaqueCaptureAddressCreateInfoKHR` for more detail.

```
typedef VkFlags VkMemoryAllocateFlags;
```

or the equivalent

```
typedef VkMemoryAllocateFlags VkMemoryAllocateFlagsKHR;
```

`VkMemoryAllocateFlags` is a bitmask type for setting a mask of zero or more `VkMemoryAllocateFlagBits`.

To request a specific device address for a memory allocation, add a `VkMemoryOpaqueCaptureAddressAllocateInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkMemoryOpaqueCaptureAddressAllocateInfoKHR` structure is defined as:

```
typedef struct VkMemoryOpaqueCaptureAddressAllocateInfoKHR {
    VkStructureType sType;
    const void*     pNext;
    uint64_t        opaqueCaptureAddress;
} VkMemoryOpaqueCaptureAddressAllocateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `opaqueCaptureAddress` is the opaque capture address requested for the memory allocation.

If `opaqueCaptureAddress` is zero, no specific address is requested.

If `opaqueCaptureAddress` is not zero, it **should** be an address retrieved from `vkGetDeviceMemoryOpaqueCaptureAddressKHR` on an identically created memory allocation on the same implementation.

*Note*

In most cases, it is expected that a non-zero `opaqueAddress` is an address retrieved from `vkGetDeviceMemoryOpaqueCaptureAddressKHR` on an identically created memory allocation. If this is not the case, it likely that `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR` errors will occur.

This is, however, not a strict requirement because trace capture/replay tools may need to adjust memory allocation parameters for imported memory.

If this structure is not present, it is as if `opaqueCaptureAddress` is zero.

### Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_MEMORY_OPAQUE_CAPTURE_ADDRESS_ALLOCATE_INFO_KHR`

To free a memory object, call:

```
void vkFreeMemory(  
    VkDevice device,  
    VkDeviceMemory memory,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that owns the memory.
- `memory` is the `VkDeviceMemory` object to be freed.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

Before freeing a memory object, an application **must** ensure the memory object is no longer in use by the device—for example by command buffers in the *pending state*. Memory **can** be freed whilst still bound to resources, but those resources **must** not be used afterwards. If there are still any bound images or buffers, the memory **may** not be immediately released by the implementation, but **must** be released by the time all bound images and buffers have been destroyed. Once memory is released, it is returned to the heap from which it was allocated.

How memory objects are bound to Images and Buffers is described in detail in the [Resource Memory Association](#) section.

If a memory object is mapped at the time it is freed, it is implicitly unmapped.

*Note*

As described [below](#), host writes are not implicitly flushed when the memory object is unmapped, but the implementation **must** guarantee that writes that have not been flushed do not affect any other memory.

## Valid Usage

- All submitted commands that refer to `memory` (via images or buffers) **must** have completed execution

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `memory` is not `VK_NULL_HANDLE`, `memory` **must** be a valid `VkDeviceMemory` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `memory` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `memory` **must** be externally synchronized

### 10.2.1. Host Access to Device Memory Objects

Memory objects created with `vkAllocateMemory` are not directly host accessible.

Memory objects created with the memory property `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` are considered *mappable*. Memory objects **must** be mappable in order to be successfully mapped on the host.

To retrieve a host virtual address pointer to a region of a mappable memory object, call:

```
VkResult vkMapMemory(  
    VkDevice                                device,  
    VkDeviceMemory                            memory,  
    VkDeviceSize                             offset,  
    VkDeviceSize                             size,  
    VkMemoryMapFlags                         flags,  
    void**                                   ppData);
```

- `device` is the logical device that owns the memory.
- `memory` is the `VkDeviceMemory` object to be mapped.
- `offset` is a zero-based byte offset from the beginning of the memory object.
- `size` is the size of the memory range to map, or `VK_WHOLE_SIZE` to map from `offset` to the end of the allocation.
- `flags` is reserved for future use.

- `ppData` is a pointer to a `void *` variable in which is returned a host-accessible pointer to the beginning of the mapped range. This pointer minus `offset` **must** be aligned to at least `VkPhysicalDeviceLimits::minMemoryMapAlignment`.

After a successful call to `vkMapMemory` the memory object `memory` is considered to be currently *host mapped*. It is an application error to call `vkMapMemory` on a memory object that is already host mapped.

*Note*

`vkMapMemory` will fail if the implementation is unable to allocate an appropriately sized contiguous virtual address range, e.g. due to virtual address space fragmentation or platform limits. In such cases, `vkMapMemory` **must** return `VK_ERROR_MEMORY_MAP_FAILED`. The application **can** improve the likelihood of success by reducing the size of the mapped range and/or removing unneeded mappings using `vkUnmapMemory`.

`vkMapMemory` does not check whether the device memory is currently in use before returning the host-accessible pointer. The application **must** guarantee that any previously submitted command that writes to this range has completed before the host reads from or writes to that range, and that any previously submitted command that reads from that range has completed before the host writes to that region (see [here](#) for details on fulfilling such a guarantee). If the device memory was allocated without the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` set, these guarantees **must** be made for an extended range: the application **must** round down the start of the range to the nearest multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize`, and round the end of the range up to the nearest multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize`.

While a range of device memory is host mapped, the application is responsible for synchronizing both device and host access to that memory range.

*Note*

It is important for the application developer to become meticulously familiar with all of the mechanisms described in the chapter on [Synchronization and Cache Control](#) as they are crucial to maintaining memory access ordering.

## Valid Usage

- `memory` **must** not be currently host mapped
- `offset` **must** be less than the size of `memory`
- If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be greater than `0`
- If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be less than or equal to the size of the `memory` minus `offset`
- `memory` **must** have been created with a memory type that reports `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT`
- `memory` **must** not have been allocated with multiple instances.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `memory` **must** be a valid `VkDeviceMemory` handle
- `flags` **must** be `0`
- `ppData` **must** be a valid pointer to a pointer value
- `memory` **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `memory` **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_MEMORY_MAP_FAILED`

```
typedef VkFlags VkMemoryMapFlags;
```

`VkMemoryMapFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

Two commands are provided to enable applications to work with non-coherent memory allocations: `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges`.

### Note

If the memory object was created with the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` set, `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges` are unnecessary and **may** have a performance cost. However, [availability and visibility operations](#) still need to be managed on the device. See the description of [host access types](#) for more information.

*Note*

While memory objects imported from a handle type of `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT` are inherently mapped to host address space, they are not considered to be host mapped device memory unless they are explicitly host mapped using `vkMapMemory`. That means flushing or invalidating host caches with respect to host accesses performed on such memory through the original host pointer specified at import time is the responsibility of the application and **must** be performed with appropriate synchronization primitives provided by the platform which are outside the scope of Vulkan. `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges`, however, **can** still be used on such memory objects to synchronize host accesses performed through the host pointer of the host mapped device memory range returned by `vkMapMemory`.

To flush ranges of non-coherent memory from the host caches, call:

```
VkResult vkFlushMappedMemoryRanges(  
    VkDevice device,  
    uint32_t memoryRangeCount,  
    const VkMappedMemoryRange* pMemoryRanges);
```

- `device` is the logical device that owns the memory ranges.
- `memoryRangeCount` is the length of the `pMemoryRanges` array.
- `pMemoryRanges` is a pointer to an array of `VkMappedMemoryRange` structures describing the memory ranges to flush.

`vkFlushMappedMemoryRanges` guarantees that host writes to the memory ranges described by `pMemoryRanges` are made available to the host memory domain, such that they **can** be made available to the device memory domain via `memory domain operations` using the `VK_ACCESS_HOST_WRITE_BIT` access type.

Within each range described by `pMemoryRanges`, each set of `nonCoherentAtomSize` bytes in that range is flushed if any byte in that set has been written by the host since it was first host mapped, or the last time it was flushed. If `pMemoryRanges` includes sets of `nonCoherentAtomSize` bytes where no bytes have been written by the host, those bytes **must** not be flushed.

Unmapping non-coherent memory does not implicitly flush the host mapped memory, and host writes that have not been flushed **may** not ever be visible to the device. However, implementations **must** ensure that writes that have not been flushed do not become visible to any other memory.

*Note*

The above guarantee avoids a potential memory corruption in scenarios where host writes to a mapped memory object have not been flushed before the memory is unmapped (or freed), and the virtual address range is subsequently reused for a different mapping (or memory allocation).

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pMemoryRanges` **must** be a valid pointer to an array of `memoryRangeCount` valid `VkMappedMemoryRange` structures
- `memoryRangeCount` **must** be greater than `0`

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To invalidate ranges of non-coherent memory from the host caches, call:

```
VkResult vkInvalidateMappedMemoryRanges(  
    VkDevice device,  
    uint32_t memoryRangeCount,  
    const VkMappedMemoryRange* pMemoryRanges);
```

- `device` is the logical device that owns the memory ranges.
- `memoryRangeCount` is the length of the `pMemoryRanges` array.
- `pMemoryRanges` is a pointer to an array of `VkMappedMemoryRange` structures describing the memory ranges to invalidate.

`vkInvalidateMappedMemoryRanges` guarantees that device writes to the memory ranges described by `pMemoryRanges`, which have been made available to the host memory domain using the `VK_ACCESS_HOST_WRITE_BIT` and `VK_ACCESS_HOST_READ_BIT` access types, are made visible to the host. If a range of non-coherent memory is written by the host and then invalidated without first being flushed, its contents are undefined.

Within each range described by `pMemoryRanges`, each set of `nonCoherentAtomSize` bytes in that range is invalidated if any byte in that set has been written by the device since it was first host mapped, or the last time it was invalidated.

### Note

Mapping non-coherent memory does not implicitly invalidate that memory.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pMemoryRanges` **must** be a valid pointer to an array of `memoryRangeCount` valid `VkMappedMemoryRange` structures
- `memoryRangeCount` **must** be greater than `0`

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkMappedMemoryRange` structure is defined as:

```
typedef struct VkMappedMemoryRange {  
    VkStructureType    sType;  
    const void*        pNext;  
    VkDeviceMemory     memory;  
    VkDeviceSize       offset;  
    VkDeviceSize       size;  
} VkMappedMemoryRange;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `memory` is the memory object to which this range belongs.
- `offset` is the zero-based byte offset from the beginning of the memory object.
- `size` is either the size of range, or `VK_WHOLE_SIZE` to affect the range from `offset` to the end of the current mapping of the allocation.

## Valid Usage

- `memory` **must** be currently host mapped
- If `size` is not equal to `VK_WHOLE_SIZE`, `offset` and `size` **must** specify a range contained within the currently mapped range of `memory`
- If `size` is equal to `VK_WHOLE_SIZE`, `offset` **must** be within the currently mapped range of `memory`
- If `size` is equal to `VK_WHOLE_SIZE`, the end of the current mapping of `memory` **must** be a multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize` bytes from the beginning of the memory object.
- `offset` **must** be a multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize`
- If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** either be a multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize`, or `offset` plus `size` **must** equal the size of `memory`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE`
- `pNext` **must** be `NULL`
- `memory` **must** be a valid `VkDeviceMemory` handle

To unmap a memory object once host access to it is no longer needed by the application, call:

```
void vkUnmapMemory(  
    VkDevice           device,  
    VkDeviceMemory     memory);
```

- `device` is the logical device that owns the memory.
- `memory` is the memory object to be unmapped.

## Valid Usage

- `memory` **must** be currently host mapped

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `memory` **must** be a valid `VkDeviceMemory` handle
- `memory` **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `memory` **must** be externally synchronized

### 10.2.2. Lazily Allocated Memory

If the memory object is allocated from a heap with the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set, that object's backing memory **may** be provided by the implementation lazily. The actual committed size of the memory **may** initially be as small as zero (or as large as the requested size), and monotonically increases as additional memory is needed.

A memory type with this flag set is only allowed to be bound to a `VkImage` whose usage flags include `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`.

*Note*

Using lazily allocated memory objects for framebuffer attachments that are not needed once a render pass instance has completed **may** allow some implementations to never allocate memory for such attachments.

To determine the amount of lazily-allocated memory that is currently committed for a memory object, call:

```
void vkGetDeviceMemoryCommitment(  
    VkDevice                                     device,  
    VkDeviceMemory                                memory,  
    VkDeviceSize*                                 pCommittedMemoryInBytes);
```

- `device` is the logical device that owns the memory.
- `memory` is the memory object being queried.
- `pCommittedMemoryInBytes` is a pointer to a `VkDeviceSize` value in which the number of bytes currently committed is returned, on success.

The implementation **may** update the commitment at any time, and the value returned by this query **may** be out of date.

The implementation guarantees to allocate any committed memory from the `heapIndex` indicated by the memory type that the memory object was created with.

### Valid Usage

- `memory` **must** have been created with a memory type that reports `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `memory` **must** be a valid `VkDeviceMemory` handle
- `pCommittedMemoryInBytes` **must** be a valid pointer to a `VkDeviceSize` value
- `memory` **must** have been created, allocated, or retrieved from `device`

### 10.2.3. Protected Memory

*Protected memory* divides device memory into protected device memory and unprotected device memory.

Protected memory adds the following concepts:

- Memory:
  - Unprotected device memory, which **can** be visible to the device and **can** be visible to the host
  - Protected device memory, which **can** be visible to the device but **must** not be visible to the host
- Resources:
  - Unprotected images and unprotected buffers, to which unprotected memory **can** be bound
  - Protected images and protected buffers, to which protected memory **can** be bound
- Command buffers:
  - Unprotected command buffers, which **can** be submitted to a device queue to execute unprotected queue operations
  - Protected command buffers, which **can** be submitted to a protected-capable device queue to execute protected queue operations
- Device queues:
  - Unprotected device queues, to which unprotected command buffers **can** be submitted
  - Protected-capable device queues, to which unprotected command buffers or protected command buffers **can** be submitted
- Queue submissions
  - Unprotected queue submissions, through which unprotected command buffers **can** be submitted
  - Protected queue submissions, through which protected command buffers **can** be submitted
- Queue operations
  - Unprotected queue operations
  - Protected queue operations

## Protected Memory Access Rules

If `VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault` is `VK_FALSE`, applications **must** not perform any of the following operations:

- Write to unprotected memory within protected queue operations.
- Access protected memory within protected queue operations other than in framebuffer-space pipeline stages, the compute shader stage, or the transfer stage.
- Perform a query within protected queue operations.
- Execute an indirect command within protected queue operations.

If `VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault` is `VK_TRUE`, these operations are valid, but reads will return undefined values, and writes will either be dropped or store undefined values.

Whether these operations are valid or not, or if any other invalid usage is performed, the implementation **must** guarantee that:

- Protected device memory **must** never be visible to the host.
- Values written to unprotected device memory **must** not be a function of values from protected memory.

### 10.2.4. External Memory Handle Types

#### Android Hardware Buffer

Android's NDK defines `AHardwareBuffer` objects, which represent device memory that is shareable across processes and that **can** be accessed by a variety of media APIs and the hardware used to implement them. These Android hardware buffer objects **may** be imported into `VkDeviceMemory` objects for access via Vulkan, or exported from Vulkan.

To remove an unnecessary compile-time dependency, an incomplete type definition of `AHardwareBuffer` is provided in the Vulkan headers:

```
struct AHardwareBuffer;
```

The actual `AHardwareBuffer` type is defined in Android NDK headers.

#### Note

The NDK format, usage, and size/dimensions of an `AHardwareBuffer` object can be obtained with the `AHardwareBuffer_describe` function. While Android hardware buffers can be imported to or exported from Vulkan without using that function, valid usage and implementation behavior is defined in terms of the `AHardwareBuffer_Desc` properties it returns.

Android hardware buffer objects are reference-counted using Android NDK functions outside of the scope of this specification. A `VkDeviceMemory` imported from an Android hardware buffer or

that **can** be exported to an Android hardware buffer **must** acquire a reference to its [AHardwareBuffer](#) object, and **must** release this reference when the device memory is freed. During the host execution of a Vulkan command that has an Android hardware buffer as a parameter (including indirect parameters via [pNext](#) chains), the application **must** not decrement the Android hardware buffer's reference count to zero.

Android hardware buffers **can** be mapped and unmapped for CPU access using the NDK functions. These lock and unlock APIs are considered to acquire and release ownership of the Android hardware buffer, and applications **must** follow the rules described in [External Resource Sharing](#) to transfer ownership between the Vulkan instance and these native APIs.

Android hardware buffers **can** be shared with external APIs and Vulkan instances on the same device, and also with foreign devices. When transferring ownership of the Android hardware buffer, the external and foreign special queue families described in [Queue Family Ownership Transfer](#) are not identical. All APIs which produce or consume Android hardware buffers are considered to use foreign devices, except OpenGL ES contexts and Vulkan logical devices that have matching device and driver UUIDs. Implementations **may** treat a transfer to or from the foreign queue family as if it were a transfer to or from the external queue family when the Android hardware buffer's usage only permits it to be used on the same physical device.

### Android Hardware Buffer Optimal Usages

Vulkan buffer and image usage flags do not correspond exactly to Android hardware buffer usage flags. When allocating Android hardware buffers with non-Vulkan APIs, if any [AHARDWAREBUFFER\\_USAGE\\_GPU\\_\\*](#) usage bits are included, by default the allocator **must** allocate the memory in such a way that it supports Vulkan usages and creation flags in the [usage equivalence table](#) which do not have Android hardware buffer equivalents.

The [VkAndroidHardwareBufferUsageANDROID](#) structure **can** be attached to the [pNext](#) chain of a [VkImageFormatProperties2](#) instance passed to [vkGetPhysicalDeviceImageFormatProperties2](#) to obtain optimal Android hardware buffer usage flags for specific Vulkan resource creation parameters. Some usage flags returned by these commands are **required** based on the input parameters, but additional vendor-specific usage flags ([AHARDWAREBUFFER\\_USAGE\\_VENDOR\\_\\*](#)) **may** also be returned. Any Android hardware buffer allocated with these vendor-specific usage flags and imported to Vulkan **must** only be bound to resources created with parameters that are a subset of the parameters used to obtain the Android hardware buffer usage, since the memory **may** have been allocated in a way incompatible with other parameters. If an Android hardware buffer is successfully allocated with additional non-vendor-specific usage flags in addition to the recommended usage, it **must** support being used in the same ways as an Android hardware buffer allocated with only the recommended usage, and also in ways indicated by the additional usage.

### Android Hardware Buffer External Formats

Android hardware buffers **may** represent images using implementation-specific formats, layouts, color models, etc., which do not have Vulkan equivalents. Such *external formats* are commonly used by external image sources such as video decoders or cameras. Vulkan **can** import Android hardware buffers that have external formats, but since the image contents are in an undiscoverable and possibly proprietary representation, images with external formats **must** only be used as sampled images, **must** only be sampled with a sampler that has Y'C<sub>B</sub>C<sub>R</sub> conversion

enabled, and **must** have optimal tiling.

Images that will be backed by an Android hardware buffer **can** use an external format by setting `VkImageCreateInfo::format` to `VK_FORMAT_UNDEFINED` and including an instance of `VkExternalFormatANDROID` in the `pNext` chain. Images **can** be created with an external format even if the Android hardware buffer has a format which has an equivalent Vulkan format to enable consistent handling of images from sources that might use either category of format. However, all images created with an external format are subject to the valid usage requirements associated with external formats, even if the Android hardware buffer's format has a Vulkan equivalent. The external format of an Android hardware buffer **can** be obtained by passing an instance of `VkAndroidHardwareBufferFormatPropertiesANDROID` to `vkGetAndroidHardwareBufferPropertiesANDROID`.

### Android Hardware Buffer Image Resources

Android hardware buffers have intrinsic width, height, format, and usage properties, so Vulkan images bound to memory imported from an Android hardware buffer **must** use dedicated allocations: `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` **must** be `VK_TRUE` for images created with `VkExternalMemoryImageCreateInfo::handleTypes` that includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`. When creating an image that will be bound to an imported Android hardware buffer, the image creation parameters **must** be equivalent to the `AHardwareBuffer` properties as described by the valid usage of `VkMemoryAllocateInfo`. Similarly, device memory allocated for a dedicated image **must** not be exported to an Android hardware buffer until it has been bound to that image, and the implementation **must** return an Android hardware buffer with properties derived from the image:

- The `width` and `height` members of `AHardwareBuffer_Desc` **must** be the same as the `width` and `height` members of `VkImageCreateInfo::extent`, respectively.
- The `layers` member of `AHardwareBuffer_Desc` **must** be the same as the `arrayLayers` member of `VkImageCreateInfo`.
- The `format` member of `AHardwareBuffer_Desc` **must** be equivalent to `VkImageCreateInfo::format` as defined by `AHardwareBuffer Format Equivalence`.
- The `usage` member of `AHardwareBuffer_Desc` **must** include bits corresponding to bits included in `VkImageCreateInfo::usage` and `VkImageCreateInfo::flags` where such a correspondence exists according to `AHardwareBuffer Usage Equivalence`. It **may** also include additional usage bits, including vendor-specific usages. Presence of vendor usage bits **may** make the Android hardware buffer only usable in ways indicated by the image creation parameters, even when used outside Vulkan, in a similar way that allocating the Android hardware buffer with usage returned in `VkAndroidHardwareBufferUsageANDROID` does.

Implementations **may** support fewer combinations of image creation parameters for images with Android hardware buffer external handle type than for non-external images. Support for a given set of parameters **can** be determined by passing `VkExternalImageFormatProperties` to `vkGetPhysicalDeviceImageFormatProperties2` with `handleType` set to `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`. Any Android hardware buffer successfully allocated outside Vulkan with usage that includes `AHARDWAREBUFFER_USAGE_GPU_*` **must** be supported when using equivalent Vulkan image parameters. If a given choice of image parameters are supported for import, they **can** also be used to create an image and memory that

will be exported to an Android hardware buffer.

*Table 13. AHardwareBuffer Format Equivalence*

AHardwareBuffer Format	Vulkan Format
AHARDWAREBUFFER_FORMAT_R8G8B8A8_UNORM	VK_FORMAT_R8G8B8A8_UNORM
AHARDWAREBUFFER_FORMAT_R8G8B8X8_UNORM <sup>1</sup>	VK_FORMAT_R8G8B8A8_UNORM

AHARDWAREBUFFER_FORMAT_D32_FLOAT	VK_FORMAT_D32_SFLOAT
AHARDWAREBUFFER_FORMAT_D32_FLOAT_S8_UINT	VK_FORMAT_D32_SFLOAT_S8_UINT
AHARDWAREBUFFER_FORMAT_S8_UINT	VK_FORMAT_S8_UINT

*Table 14. AHardwareBuffer Usage Equivalence*

AHardwareBuffer Usage	Vulkan Usage or Creation Flag
None	VK_IMAGE_USAGE_TRANSFER_SRC_BIT
None	VK_IMAGE_USAGE_TRANSFER_DST_BIT
AHARDWAREBUFFER_USAGE_GPU_SAMPLED_IMAGE	VK_IMAGE_USAGE_SAMPLED_BIT
AHARDWAREBUFFER_USAGE_GPU_SAMPLED_IMAGE	VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT
AHARDWAREBUFFER_USAGE_GPU_COLOR_OUTPUT	VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT
AHARDWAREBUFFER_USAGE_GPU_CUBE_MAP	VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT
AHARDWAREBUFFER_USAGE_GPU_MIPMAP_COMPLETE	None <sup>2</sup>
AHARDWAREBUFFER_USAGE_PROTECTED_CONTENT	VK_IMAGE_CREATE_PROTECTED_BIT
None	VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT
None	VK_IMAGE_CREATE_EXTENDED_USAGE_BIT

1

Vulkan does not differentiate between AHARDWAREBUFFER\_FORMAT\_R8G8B8A8\_UNORM and AHARDWAREBUFFER\_FORMAT\_R8G8B8X8\_UNORM: they both behave as VK\_FORMAT\_R8G8B8A8\_UNORM. After an external entity writes to a AHARDWAREBUFFER\_FORMAT\_R8G8B8X8\_UNORM Android hardware buffer, the values read by Vulkan from the X/A channel are undefined. To emulate the traditional behavior of the X channel during sampling or blending, applications **should** use VK\_COMPONENT\_SWIZZLE\_ONE in image view component mappings and VK\_BLEND\_FACTOR\_ONE in color blend factors. There is no way to avoid copying these undefined values when copying from such an image to another image or buffer.

2

The AHARDWAREBUFFER\_USAGE\_GPU\_MIPMAP\_COMPLETE flag does not correspond to a Vulkan image usage or creation flag. Instead, its presence indicates that the Android hardware buffer contains a complete mipmap chain, and its absence indicates that the Android hardware buffer contains

only a single mip level.

*Note*

When using `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` with Android hardware buffer images, applications **should** use `VkImageFormatListCreateInfoKHR` to inform the implementation which view formats will be used with the image. For some common sets of format, this allows some implementations to provide significantly better performance when accessing the image via Vulkan.

### Android Hardware Buffer Buffer Resources

Android hardware buffers with a format of `AHARDWAREBUFFER_FORMAT_BLOB` and usage that includes `AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER` **can** be used as the backing store for `VkBuffer` objects. Such Android hardware buffers have a size in bytes specified by their `width`; `height` and `layers` are both `1`.

Unlike images, buffer resources backed by Android hardware buffers do not require dedicated allocations.

Exported `AHardwareBuffer` objects that do not have dedicated images **must** have a format of `AHARDWAREBUFFER_FORMAT_BLOB`, usage **must** include `AHARDWAREBUFFER_USAGE_GPU_DATA_BUFFER`, `width` **must** equal the device memory allocation size, and `height` and `layers` **must** be `1`.

### 10.2.5. Peer Memory Features

*Peer memory* is memory that is allocated for a given physical device and then bound to a resource and accessed by a different physical device, in a logical device that represents multiple physical devices. Some ways of reading and writing peer memory **may** not be supported by a device.

To determine how peer memory **can** be accessed, call:

```
void vkGetDeviceGroupPeerMemoryFeatures(  
    VkDevice device,  
    uint32_t heapIndex,  
    uint32_t localDeviceIndex,  
    uint32_t remoteDeviceIndex,  
    VkPeerMemoryFeatureFlags* pPeerMemoryFeatures);
```

or the equivalent command

```
void vkGetDeviceGroupPeerMemoryFeaturesKHR(  
    VkDevice device,  
    uint32_t heapIndex,  
    uint32_t localDeviceIndex,  
    uint32_t remoteDeviceIndex,  
    VkPeerMemoryFeatureFlags* pPeerMemoryFeatures);
```

- `device` is the logical device that owns the memory.

- `heapIndex` is the index of the memory heap from which the memory is allocated.
- `localDeviceIndex` is the device index of the physical device that performs the memory access.
- `remoteDeviceIndex` is the device index of the physical device that the memory is allocated for.
- `pPeerMemoryFeatures` is a pointer to a `VkPeerMemoryFeatureFlags` bitmask indicating which types of memory accesses are supported for the combination of heap, local, and remote devices.

## Valid Usage

- `heapIndex` **must** be less than `memoryHeapCount`
- `localDeviceIndex` **must** be a valid device index
- `remoteDeviceIndex` **must** be a valid device index
- `localDeviceIndex` **must** not equal `remoteDeviceIndex`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pPeerMemoryFeatures` **must** be a valid pointer to a `VkPeerMemoryFeatureFlags` value

Bits which **may** be set in the value returned for `vkGetDeviceGroupPeerMemoryFeatures`::`pPeerMemoryFeatures`, indicating the supported peer memory features, are:

```
typedef enum VkPeerMemoryFeatureFlagBits {
    VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT = 0x00000001,
    VK_PEER_MEMORY_FEATURE_COPY_DST_BIT = 0x00000002,
    VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT = 0x00000004,
    VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT = 0x00000008,
    VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT_KHR = VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT,
    VK_PEER_MEMORY_FEATURE_COPY_DST_BIT_KHR = VK_PEER_MEMORY_FEATURE_COPY_DST_BIT,
    VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT_KHR =
VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT,
    VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT_KHR =
VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT,
    VK_PEER_MEMORY_FEATURE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkPeerMemoryFeatureFlagBits;
```

or the equivalent

```
typedef VkPeerMemoryFeatureFlagBits VkPeerMemoryFeatureFlagBitsKHR;
```

- `VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT` specifies that the memory **can** be accessed as the source of a `vkCmdCopyBuffer`, `vkCmdCopyImage`, `vkCmdCopyBufferToImage`, or `vkCmdCopyImageToBuffer` command.

- `VK_PEER_MEMORY_FEATURE_COPY_DST_BIT` specifies that the memory **can** be accessed as the destination of a `vkCmdCopyBuffer`, `vkCmdCopyImage`, `vkCmdCopyBufferToImage`, or `vkCmdCopyImageToBuffer` command.
- `VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT` specifies that the memory **can** be read as any memory access type.
- `VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT` specifies that the memory **can** be written as any memory access type. Shader atomics are considered to be writes.

*Note*

The peer memory features of a memory heap also apply to any accesses that **may** be performed during [image layout transitions](#).

`VK_PEER_MEMORY_FEATURE_COPY_DST_BIT` **must** be supported for all host local heaps and for at least one device local heap.

If a device does not support a peer memory feature, it is still valid to use a resource that includes both local and peer memory bindings with the corresponding access type as long as only the local bindings are actually accessed. For example, an application doing split-frame rendering would use framebuffer attachments that include both local and peer memory bindings, but would scissor the rendering to only update local memory.

```
typedef VkFlags VkPeerMemoryFeatureFlags;
```

or the equivalent

```
typedef VkPeerMemoryFeatureFlags VkPeerMemoryFeatureFlagsKHR;
```

`VkPeerMemoryFeatureFlags` is a bitmask type for setting a mask of zero or more `VkPeerMemoryFeatureFlagBits`.

To query a 64-bit opaque capture address value from a memory object, call:

```
uint64_t vkGetDeviceMemoryOpaqueCaptureAddressKHR(
    VkDevice                           device,
    const VkDeviceMemoryOpaqueCaptureAddressInfoKHR* pInfo);
```

- `device` is the logical device that the memory object was allocated on.
- `pInfo` is a pointer to an instance of the `VkDeviceMemoryOpaqueCaptureAddressInfoKHR` structure specifying the memory object to retrieve an address for.

The 64-bit return value is an opaque address representing the start of `pInfo::memory`.

If the memory object was allocated with a non-zero value of `VkMemoryOpaqueCaptureAddressAllocateInfoKHR::opaqueCaptureAddress`, the return value **must** be the same address.

*Note*

The expected usage for these opaque addresses is only for trace capture/replay tools to store these addresses in a trace and subsequently specify them during replay.

## Valid Usage

- The `bufferDeviceAddress` feature **must** be enabled
- If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature **must** be enabled

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pInfo` **must** be a valid pointer to a valid `VkDeviceMemoryOpaqueCaptureAddressInfoKHR` structure

The `VkDeviceMemoryOpaqueCaptureAddressInfoKHR` structure is defined as:

```
typedef struct VkDeviceMemoryOpaqueCaptureAddressInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
} VkDeviceMemoryOpaqueCaptureAddressInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `memory` specifies the memory whose address is being queried.

## Valid Usage

- `memory` **must** have been allocated with `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT_KHR`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_MEMORY_OPAQUE_CAPTURE_ADDRESS_INFO_KHR`
- `pNext` **must** be `NULL`
- `memory` **must** be a valid `VkDeviceMemory` handle

# Chapter 11. Resource Creation

Vulkan supports two primary resource types: *buffers* and *images*. Resources are views of memory with associated formatting and dimensionality. Buffers are essentially unformatted arrays of bytes whereas images contain format information, **can** be multidimensional and **may** have associated metadata.

## 11.1. Buffers

Buffers represent linear arrays of data which are used for various purposes by binding them to a graphics or compute pipeline via descriptor sets or via certain commands, or by directly specifying them as parameters to certain commands.

Buffers are represented by `VkBuffer` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBuffer)
```

To create buffers, call:

```
VkResult vkCreateBuffer(  
    VkDevice                                     device,  
    const VkBufferCreateInfo*                    pCreateInfo,  
    const VkAllocationCallbacks*                pAllocator,  
    VkBuffer*                                    pBuffer);
```

- `device` is the logical device that creates the buffer object.
- `pCreateInfo` is a pointer to a `VkBufferCreateInfo` structure containing parameters affecting creation of the buffer.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pBuffer` is a pointer to a `VkBuffer` handle in which the resulting buffer object is returned.

### Valid Usage

- If the `flags` member of `pCreateInfo` includes `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`, creating this `VkBuffer` **must** not cause the total required sparse memory for all currently valid sparse resources on the device to exceed `VkPhysicalDeviceLimits::sparseAddressSpaceSize`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkBufferCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pBuffer` **must** be a valid pointer to a `VkBuffer` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`

The `VkBufferCreateInfo` structure is defined as:

```
typedef struct VkBufferCreateInfo {
    VkStructureType          sType;
    const void*               pNext;
    VkBufferCreateFlags        flags;
    VkDeviceSize                size;
    VkBufferUsageFlags         usage;
    VkSharingMode              sharingMode;
    uint32_t                  queueFamilyIndexCount;
    const uint32_t*            pQueueFamilyIndices;
} VkBufferCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is a bitmask of `VkBufferCreateFlagBits` specifying additional parameters of the buffer.
- `size` is the size in bytes of the buffer to be created.
- `usage` is a bitmask of `VkBufferUsageFlagBits` specifying allowed usages of the buffer.
- `sharingMode` is a `VkSharingMode` value specifying the sharing mode of the buffer when it will be accessed by multiple queue families.
- `queueFamilyIndexCount` is the number of entries in the `pQueueFamilyIndices` array.
- `pQueueFamilyIndices` is a list of queue families that will access this buffer (ignored if `sharingMode` is not `VK_SHARING_MODE_CONCURRENT`).

## Valid Usage

- `size` **must** be greater than `0`
- If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `pQueueFamilyIndices` **must** be a valid pointer to an array of `queueFamilyIndexCount uint32_t` values
- If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `queueFamilyIndexCount` **must** be greater than `1`
- If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` **must** be unique and **must** be less than `pQueueFamilyPropertyCount` returned by either `vkGetPhysicalDeviceQueueFamilyProperties` or `vkGetPhysicalDeviceQueueFamilyProperties2` for the `physicalDevice` that was used to create `device`
- If the `sparse bindings` feature is not enabled, `flags` **must** not contain `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`
- If the `sparse buffer residency` feature is not enabled, `flags` **must** not contain `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`
- If the `sparse aliased residency` feature is not enabled, `flags` **must** not contain `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT`
- If `flags` contains `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` or `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT`, it **must** also contain `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`
- If the `pNext` chain contains an instance of `VkExternalMemoryBufferCreateInfo`, its `handleTypes` member **must** only contain bits that are also in `VkExternalBufferProperties::externalMemoryProperties.compatibleHandleTypes`, as returned by `vkGetPhysicalDeviceExternalBufferProperties` with `pExternalBufferCreateInfo->handleType` equal to any one of the handle types specified in `VkExternalMemoryBufferCreateInfo::handleTypes`
- If the protected memory feature is not enabled, `flags` **must** not contain `VK_BUFFER_CREATE_PROTECTED_BIT`
- If any of the bits `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`, `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` are set, `VK_BUFFER_CREATE_PROTECTED_BIT` **must** not also be set
- If the `pNext` chain contains an instance of `VkDedicatedAllocationBufferCreateInfoNV`, and the `dedicatedAllocation` member of the chained structure is `VK_TRUE`, then `flags` **must** not include `VK_BUFFER_CREATE_SPARSE_BINDING_BIT`, `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT`
- If `VkBufferDeviceAddressCreateInfoEXT::deviceAddress` is not zero, `flags` **must** include `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`
- If `VkBufferOpaqueCaptureAddressCreateInfoKHR::opaqueCaptureAddress` is not zero, `flags` **must** include `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`
- If `flags` includes `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`, the `bufferDeviceAddressCaptureReplay` or `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::bufferDeviceAddressCaptureReplay` feature **must** be enabled

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkBufferDeviceAddressCreateInfoEXT`, `VkBufferOpaqueCaptureAddressCreateInfoKHR`, `VkDedicatedAllocationBufferCreateInfoNV`, or `VkExternalMemoryBufferCreateInfo`
- Each `sType` member in the `pNext` chain **must** be unique
- `flags` **must** be a valid combination of `VkBufferCreateFlagBits` values
- `usage` **must** be a valid combination of `VkBufferUsageFlagBits` values
- `usage` **must** not be `0`
- `sharingMode` **must** be a valid `VkSharingMode` value

Bits which **can** be set in `VkBufferCreateInfo::usage`, specifying usage behavior of a buffer, are:

```
typedef enum VkBufferUsageFlagBits {
    VK_BUFFER_USAGE_TRANSFER_SRC_BIT = 0x00000001,
    VK_BUFFER_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT = 0x00000004,
    VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT = 0x00000008,
    VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT = 0x00000010,
    VK_BUFFER_USAGE_STORAGE_BUFFER_BIT = 0x00000020,
    VK_BUFFER_USAGE_INDEX_BUFFER_BIT = 0x00000040,
    VK_BUFFER_USAGE_VERTEX_BUFFER_BIT = 0x00000080,
    VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT = 0x00000100,
    VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT = 0x00000800,
    VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT = 0x00001000,
    VK_BUFFER_USAGE_CONDITIONAL_RENDERING_BIT_EXT = 0x00000200,
    VK_BUFFER_USAGE_RAY_TRACING_BIT_NV = 0x00000400,
    VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_KHR = 0x00020000,
    VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_EXT =
VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_KHR,
    VK_BUFFER_USAGE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkBufferUsageFlagBits;
```

- `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` specifies that the buffer **can** be used as the source of a *transfer command* (see the definition of `VK_PIPELINE_STAGE_TRANSFER_BIT`).
- `VK_BUFFER_USAGE_TRANSFER_DST_BIT` specifies that the buffer **can** be used as the destination of a transfer command.
- `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT` specifies that the buffer **can** be used to create a `VkBufferView` suitable for occupying a `VkDescriptorSet` slot of type `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`.
- `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT` specifies that the buffer **can** be used to create a

`VkBufferView` suitable for occupying a `VkDescriptorSet` slot of type `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`.

- `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` specifies that the buffer **can** be used in a `VkDescriptorBufferInfo` suitable for occupying a `VkDescriptorSet` slot either of type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`.
- `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` specifies that the buffer **can** be used in a `VkDescriptorBufferInfo` suitable for occupying a `VkDescriptorSet` slot either of type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`.
- `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` specifies that the buffer is suitable for passing as the `buffer` parameter to `vkCmdBindIndexBuffer`.
- `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` specifies that the buffer is suitable for passing as an element of the `pBuffers` array to `vkCmdBindVertexBuffers`.
- `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` specifies that the buffer is suitable for passing as the `buffer` parameter to `vkCmdDrawIndirect`, `vkCmdDrawIndexedIndirect`, `vkCmdDrawMeshTasksIndirectNV`, `vkCmdDrawMeshTasksIndirectCountNV`, or `vkCmdDispatchIndirect`. It is also suitable for passing as the `buffer` member of `VkIndirectCommandsTokenNVX`, or `sequencesCountBuffer` or `sequencesIndexBuffer` member of `VkCmdProcessCommandsInfoNVX`
- `VK_BUFFER_USAGE_CONDITIONAL_RENDERING_BIT_EXT` specifies that the buffer is suitable for passing as the `buffer` parameter to `vkCmdBeginConditionalRenderingEXT`.
- `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT` specifies that the buffer is suitable for using for binding as a transform feedback buffer with `vkCmdBindTransformFeedbackBuffersEXT`.
- `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT` specifies that the buffer is suitable for using as a counter buffer with `vkCmdBeginTransformFeedbackEXT` and `vkCmdEndTransformFeedbackEXT`.
- `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` specifies that the buffer is suitable for use in `vkCmdTraceRaysNV` and `vkCmdBuildAccelerationStructureNV`.
- `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_KHR` specifies that the buffer **can** be used to retrieve a buffer device address via `vkGetBufferDeviceAddressKHR` and use that address to access the buffer's memory from a shader.

```
typedef VkFlags VkBufferUsageFlags;
```

`VkBufferUsageFlags` is a bitmask type for setting a mask of zero or more `VkBufferUsageFlagBits`.

Bits which **can** be set in `VkBufferCreateInfo::flags`, specifying additional parameters of a buffer, are:

```

typedef enum VkBufferCreateFlagBits {
    VK_BUFFER_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_BUFFER_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
    VK_BUFFER_CREATE_PROTECTED_BIT = 0x00000008,
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = 0x00000010,
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT =
VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR,
    VK_BUFFER_CREATE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkBufferCreateFlagBits;

```

- **VK\_BUFFER\_CREATE\_SPARSE\_BINDING\_BIT** specifies that the buffer will be backed using sparse memory binding.
- **VK\_BUFFER\_CREATE\_SPARSE\_RESIDENCY\_BIT** specifies that the buffer **can** be partially backed using sparse memory binding. Buffers created with this flag **must** also be created with the **VK\_BUFFER\_CREATE\_SPARSE\_BINDING\_BIT** flag.
- **VK\_BUFFER\_CREATE\_SPARSE\_ALIASED\_BIT** specifies that the buffer will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another buffer (or another portion of the same buffer). Buffers created with this flag **must** also be created with the **VK\_BUFFER\_CREATE\_SPARSE\_BINDING\_BIT** flag.
- **VK\_BUFFER\_CREATE\_PROTECTED\_BIT** specifies that the buffer is a protected buffer.
- **VK\_BUFFER\_CREATE\_DEVICE\_ADDRESS\_CAPTURE\_REPLAY\_BIT\_KHR** specifies that the buffer's address **can** be saved and reused on a subsequent run (e.g. for trace capture and replay), see [VkBufferOpaqueCaptureAddressCreateInfoKHR](#) for more detail.

See [Sparse Resource Features](#) and [Physical Device Features](#) for details of the sparse memory features supported on a device.

```
typedef VkFlags VkBufferCreateFlags;
```

**VkBufferCreateFlags** is a bitmask type for setting a mask of zero or more **VkBufferCreateFlagBits**.

If the **pNext** chain includes a **VkDedicatedAllocationBufferCreateInfoNV** structure, then that structure includes an enable controlling whether the buffer will have a dedicated memory allocation bound to it.

The **VkDedicatedAllocationBufferCreateInfoNV** structure is defined as:

```

typedef struct VkDedicatedAllocationBufferCreateInfoNV {
    VkStructureType      sType;
    const void*        pNext;
    VkBool32            dedicatedAllocation;
} VkDedicatedAllocationBufferCreateInfoNV;

```

- **sType** is the type of this structure.

- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `dedicatedAllocation` specifies whether the buffer will have a dedicated allocation bound to it.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_BUFFER_CREATE_INFO_NV`

To define a set of external memory handle types that **may** be used as backing store for a buffer, add a `VkExternalMemoryBufferCreateInfo` structure to the `pNext` chain of the `VkBufferCreateInfo` structure. The `VkExternalMemoryBufferCreateInfo` structure is defined as:

```
typedef struct VkExternalMemoryBufferCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExternalMemoryBufferCreateInfo;
```

or the equivalent

```
typedef VkExternalMemoryBufferCreateInfo VkExternalMemoryBufferCreateInfoKHR;
```

### Note

An instance of `VkExternalMemoryBufferCreateInfo` must be included in the creation parameters for a buffer that will be bound to memory that is either exported or imported.

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `handleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more external memory handle types.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_BUFFER_CREATE_INFO`
- `handleTypes` must be a valid combination of `VkExternalMemoryHandleTypeFlagBits` values

To request a specific device address for a buffer, add a `VkBufferOpaqueCaptureAddressCreateInfoKHR` structure to the `pNext` chain of the `VkBufferCreateInfo` structure. The `VkBufferOpaqueCaptureAddressCreateInfoKHR` structure is defined as:

```
typedef struct VkBufferOpaqueCaptureAddressCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint64_t opaqueCaptureAddress;
} VkBufferOpaqueCaptureAddressCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `opaqueCaptureAddress` is the opaque capture address requested for the buffer.

If `opaqueCaptureAddress` is zero, no specific address is requested.

If `opaqueCaptureAddress` is not zero, then it **should** be an address retrieved from `vkGetBufferOpaqueCaptureAddressKHR` for an identically created buffer on the same implementation.

If this structure is not present, it is as if `opaqueCaptureAddress` is zero.

Apps **should** avoid creating buffers with app-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR` errors.

*Note*

The expected usage for this is that a trace capture/replay tool will add the `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR` flag to all buffers that use `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_KHR`, and during capture will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Apps/tools should avoid mixing app-provided and implementation-provided addresses for buffers created with `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`, to avoid address space allocation conflicts.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_OPAQUE_CAPTURE_ADDRESS_CREATE_INFO_KHR`

Alternatively, to request a specific device address for a buffer, add a `VkBufferDeviceAddressCreateInfoEXT` structure to the `pNext` chain of the `VkBufferCreateInfo` structure. The `VkBufferDeviceAddressCreateInfoEXT` structure is defined as:

```
typedef struct VkBufferDeviceAddressCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceAddress deviceAddress;
} VkBufferDeviceAddressCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `deviceAddress` is the device address requested for the buffer.

If `deviceAddress` is zero, no specific address is requested.

If `deviceAddress` is not zero, then it **must** be an address retrieved from an identically created buffer on the same implementation. The buffer **must** also be bound to an identically created `VkDeviceMemory` object.

If this structure is not present, it is as if `deviceAddress` is zero.

Apps **should** avoid creating buffers with app-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of `VK_ERROR_INVALID_DEVICE_ADDRESS_EXT` errors.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_CREATE_INFO_EXT`

To destroy a buffer, call:

```
void vkDestroyBuffer(
    VkDevice device,
    VkBuffer buffer,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the buffer.
- `buffer` is the buffer to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- All submitted commands that refer to `buffer`, either directly or via a `VkBufferView`, **must** have completed execution
- If `VkAllocationCallbacks` were provided when `buffer` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `buffer` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `buffer` is not `VK_NULL_HANDLE`, `buffer` **must** be a valid `VkBuffer` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `buffer` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `buffer` **must** be externally synchronized

## 11.2. Buffer Views

A *buffer view* represents a contiguous range of a buffer and a specific format to be used to interpret the data. Buffer views are used to enable shaders to access buffer contents interpreted as formatted data. In order to create a valid buffer view, the buffer **must** have been created with at least one of the following usage flags:

- `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT`
- `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`

Buffer views are represented by `VkBufferView` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBufferView)
```

To create a buffer view, call:

```

VkResult vkCreateBufferView(
    VkDevice                                     device,
    const VkBufferViewCreateInfo*                 pCreateInfo,
    const VkAllocationCallbacks*                 pAllocator,
    VkBufferView*                                pView);

```

- `device` is the logical device that creates the buffer view.
- `pCreateInfo` is a pointer to a `VkBufferViewCreateInfo` structure containing parameters to be used to create the buffer.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pView` is a pointer to a `VkBufferView` handle in which the resulting buffer view object is returned.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkBufferViewCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pView` **must** be a valid pointer to a `VkBufferView` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkBufferViewCreateInfo` structure is defined as:

```

typedef struct VkBufferViewCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkBufferViewCreateFlags   flags;
    VkBuffer                  buffer;
    VkFormat                  format;
    VkDeviceSize               offset;
    VkDeviceSize               range;
} VkBufferViewCreateInfo;

```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is reserved for future use.
- `buffer` is a `VkBuffer` on which the view will be created.
- `format` is a `VkFormat` describing the format of the data elements in the buffer.
- `offset` is an offset in bytes from the base address of the buffer. Accesses to the buffer view from shaders use addressing that is relative to this starting offset.
- `range` is a size in bytes of the buffer view. If `range` is equal to `VK_WHOLE_SIZE`, the range from `offset` to the end of the buffer is used. If `VK_WHOLE_SIZE` is used and the remaining size of the buffer is not a multiple of the `texel block size` of `format`, the nearest smaller multiple is used.

## Valid Usage

- `offset` **must** be less than the size of `buffer`
- If `range` is not equal to `VK_WHOLE_SIZE`, `range` **must** be greater than `0`
- If `range` is not equal to `VK_WHOLE_SIZE`, `range` **must** be an integer multiple of the texel block size of `format`
- If `range` is not equal to `VK_WHOLE_SIZE`, `range` divided by the texel block size of `format`, multiplied by the number of texels per texel block for that format (as defined in the [Compatible Formats](#) table), **must** be less than or equal to `VkPhysicalDeviceLimits::maxTexelBufferElements`
- If `range` is not equal to `VK_WHOLE_SIZE`, the sum of `offset` and `range` **must** be less than or equal to the size of `buffer`
- `buffer` **must** have been created with a `usage` value containing at least one of `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT` or `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`
- If `buffer` was created with `usage` containing `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT`, `format` **must** be supported for uniform texel buffers, as specified by the `VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT` flag in `VkFormatProperties::bufferFeatures` returned by `vkGetPhysicalDeviceFormatProperties`
- If `buffer` was created with `usage` containing `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`, `format` **must** be supported for storage texel buffers, as specified by the `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT` flag in `VkFormatProperties::bufferFeatures` returned by `vkGetPhysicalDeviceFormatProperties`
- If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- If the `texelBufferAlignment` feature is not enabled, `offset` **must** be a multiple of `VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`
- If the `texelBufferAlignment` feature is enabled and if `buffer` was created with `usage` containing `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`, `offset` **must** be a multiple of the lesser of `VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT::storageTexelBufferOffsetAlignmentBytes` or, if `VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT::storageTexelBufferOffsetSingleTexelAlignment` is `VK_TRUE`, the size of a texel of the requested `format`. If the size of a texel is a multiple of three bytes, then the size of a single component of `format` is used instead
- If the `texelBufferAlignment` feature is enabled and if `buffer` was created with `usage` containing `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT`, `offset` **must** be a multiple of the lesser of `VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT::uniformTexelBufferOffsetAlignmentBytes` or, if `VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT::uniformTexelBufferOffsetSingleTexelAlignment` is `VK_TRUE`, the size of a texel of the requested `format`. If the size of a texel is a multiple of three bytes, then the size of a single component of `format` is used instead

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_VIEW_CREATE_INFO`
- `pNext` **must** be `NULL`
- `flags` **must** be `0`
- `buffer` **must** be a valid `VkBuffer` handle
- `format` **must** be a valid `VkFormat` value

```
typedef VkFlags VkBufferViewCreateFlags;
```

`VkBufferViewCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a buffer view, call:

```
void vkDestroyBufferView(  
    VkDevice device,  
    VkBufferView bufferView,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the buffer view.
- `bufferView` is the buffer view to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- All submitted commands that refer to `bufferView` **must** have completed execution
- If `VkAllocationCallbacks` were provided when `bufferView` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `bufferView` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `bufferView` is not `VK_NULL_HANDLE`, `bufferView` **must** be a valid `VkBufferView` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `bufferView` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `bufferView` **must** be externally synchronized

### 11.3. Images

Images represent multidimensional - up to 3 - arrays of data which **can** be used for various purposes (e.g. attachments, textures), by binding them to a graphics or compute pipeline via descriptor sets, or by directly specifying them as parameters to certain commands.

Images are represented by `VkImage` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImage)
```

To create images, call:

```
VkResult vkCreateImage(  
    VkDevice                                     device,  
    const VkImageCreateInfo*                      pCreateInfo,  
    const VkAllocationCallbacks*                  pAllocator,  
    VkImage*                                     pImage);
```

- `device` is the logical device that creates the image.
- `pCreateInfo` is a pointer to a `VkImageCreateInfo` structure containing parameters to be used to create the image.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pImage` is a pointer to a `VkImage` handle in which the resulting image object is returned.

## Valid Usage

- If the `flags` member of `pCreateInfo` includes `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, creating this `VkImage` **must** not cause the total required sparse memory for all currently valid sparse resources on the device to exceed `VkPhysicalDeviceLimits::sparseAddressSpaceSize`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkImageCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pImage` **must** be a valid pointer to a `VkImage` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkImageCreateInfo` structure is defined as:

```
typedef struct VkImageCreateInfo {
    VkStructureType          sType;
    const void*               pNext;
    VkImageCreateFlags        flags;
    VkImageType               imageType;
    VkFormat                  format;
    VkExtent3D                extent;
    uint32_t                  mipLevels;
    uint32_t                  arrayLayers;
    VkSampleCountFlagBits     samples;
    VkImageTiling              tiling;
    VkImageUsageFlags         usage;
    VkSharingMode              sharingMode;
    uint32_t                  queueFamilyIndexCount;
    const uint32_t*            pQueueFamilyIndices;
    VkImageLayout              initialLayout;
} VkImageCreateInfo;
```

- `sType` is the type of this structure.

- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is a bitmask of `VkImageCreateFlagBits` describing additional parameters of the image.
- `imageType` is a `VkImageType` value specifying the basic dimensionality of the image. Layers in array textures do not count as a dimension for the purposes of the image type.
- `format` is a `VkFormat` describing the format and type of the texel blocks that will be contained in the image.
- `extent` is a `VkExtent3D` describing the number of data elements in each dimension of the base level.
- `mipLevels` describes the number of levels of detail available for minified sampling of the image.
- `arrayLayers` is the number of layers in the image.
- `samples` is a `VkSampleCountFlagBits` specifying the number of samples per texel.
- `tiling` is a `VkImageTiling` value specifying the tiling arrangement of the texel blocks in memory.
- `usage` is a bitmask of `VkImageUsageFlagBits` describing the intended usage of the image.
- `sharingMode` is a `VkSharingMode` value specifying the sharing mode of the image when it will be accessed by multiple queue families.
- `queueFamilyIndexCount` is the number of entries in the `pQueueFamilyIndices` array.
- `pQueueFamilyIndices` is a list of queue families that will access this image (ignored if `sharingMode` is not `VK_SHARING_MODE_CONCURRENT`).
- `initialLayout` is a `VkImageLayout` value specifying the initial `VkImageLayout` of all image subresources of the image. See [Image Layouts](#).

Images created with `tiling` equal to `VK_IMAGE_TILING_LINEAR` have further restrictions on their limits and capabilities compared to images created with `tiling` equal to `VK_IMAGE_TILING_OPTIMAL`. Creation of images with tiling `VK_IMAGE_TILING_LINEAR` **may** not be supported unless other parameters meet all of the constraints:

- `imageType` is `VK_IMAGE_TYPE_2D`
- `format` is not a depth/stencil format
- `mipLevels` is 1
- `arrayLayers` is 1
- `samples` is `VK_SAMPLE_COUNT_1_BIT`
- `usage` only includes `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` and/or `VK_IMAGE_USAGE_TRANSFER_DST_BIT`

Images created with a `format` from one of those listed in [Formats requiring sampler Y'C<sub>B</sub>C<sub>R</sub> conversion for VK\\_IMAGE\\_ASPECT\\_COLOR\\_BIT image views](#) have further restrictions on their limits and capabilities compared to images created with other formats. Creation of images with a format requiring `Y'CBCR conversion` **may** not be supported unless other parameters meet all of the constraints:

- `imageType` is `VK_IMAGE_TYPE_2D`
- `mipLevels` is 1

- `arrayLayers` is 1
- `samples` is `VK_SAMPLE_COUNT_1_BIT`

Implementations **may** support additional limits and capabilities beyond those listed above.

To determine the set of valid `usage` bits for a given format, call [vkGetPhysicalDeviceFormatProperties](#).

If the size of the resultant image would exceed `maxResourceSize`, then [vkCreateImage](#) **must** fail and return `VK_ERROR_OUT_OF_DEVICE_MEMORY`. This failure **may** occur even when all image creation parameters satisfy their valid usage requirements.

*Note*

For images created without `VK_IMAGE_CREATE_EXTENDED_USAGE_BIT` a `usage` bit is valid if it is supported for the format the image is created with.

For images created with `VK_IMAGE_CREATE_EXTENDED_USAGE_BIT` a `usage` bit is valid if it is supported for at least one of the formats a [VkImageView](#) created from the image **can** have (see [Image Views](#) for more detail).

## Image Creation Limits

Valid values for some image creation parameters are limited by a numerical upper bound or by inclusion in a bitset. For example, `VkImageCreateInfo::arrayLayers` is limited by `imageCreateMaxArrayLayers`, defined below; and `VkImageCreateInfo::samples` is limited by `imageCreateSampleCounts`, also defined below.

Several limiting values are defined below, as well as assisting values from which the limiting values are derived. The limiting values are referenced by the relevant valid usage statements of `VkImageCreateInfo`.

- Let `uint64_t imageCreateDrmFormatModifiers[]` be the set of Linux DRM format modifiers that the resultant image **may** have.
  - If `tiling` is not `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `imageCreateDrmFormatModifiers` is empty.
  - If `VkImageCreateInfo::pNext` contains `VkImageDrmFormatModifierExplicitCreateInfoEXT`, then `imageCreateDrmFormatModifiers` contains exactly one modifier, `VkImageDrmFormatModifierExplicitCreateInfoEXT::drmFormatModifier`.
  - If `VkImageCreateInfo::pNext` contains `VkImageDrmFormatModifierListCreateInfoEXT`, then `imageCreateDrmFormatModifiers` contains the exactly the modifiers in `VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers`.
- Let `VkBool32 imageCreateMaybeLinear` indicate if the resultant image may be `linear`.
  - If `tiling` is `VK_IMAGE_TILING_LINEAR`, then `imageCreateMaybeLinear` is `true`.
  - If `tiling` is `VK_IMAGE_TILING_OPTIMAL`, then `imageCreateMaybeLinear` is `false`.
  - If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `imageCreateMaybeLinear` is `true` if and only if `imageCreateDrmFormatModifiers` contains `DRM_FORMAT_MOD_LINEAR`.
- Let `VkFormatFeatureFlags imageCreateFormatFeatures` be the set of format features available during image creation.
  - If `tiling` is `VK_IMAGE_TILING_LINEAR`, then `imageCreateFormatFeatures` is the value of `VkImageFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` with parameter `format` equal to `VkImageCreateInfo::format`.
  - If `tiling` is `VK_IMAGE_TILING_OPTIMAL`, and if the `pNext` chain contains no instance of `VkExternalFormatANDROID` with non-zero `externalFormat`, then `imageCreateFormatFeatures` is value of `VkImageFormatProperties::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` with parameter `format` equal to `VkImageCreateInfo::format`.
  - If `tiling` is `VK_IMAGE_TILING_OPTIMAL`, and if the `pNext` chain contains an instance of `VkExternalFormatANDROID` with non-zero `externalFormat`, then `imageCreateFormatFeatures` is the value of `VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures` obtained by `vkGetAndroidHardwareBufferPropertiesANDROID` with a matching `externalFormat`

value.

- If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the value of `imageCreateFormatFeatures` is found by calling `vkGetPhysicalDeviceFormatProperties2` with `VkImageFormatProperties::format` equal to `VkImageCreateInfo::format` and with `VkDrmFormatModifierPropertiesListEXT` chained into `VkImageFormatProperties2`; by collecting all members of the returned array `VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties` whose `drmFormatModifier` belongs to `imageCreateDrmFormatModifiers`; and by taking the bitwise intersection, over the collected array members, of `drmFormatModifierTilingFeatures`. (The resultant `imageCreateFormatFeatures` **may** be empty).
- Let `VkImageFormatProperties2 imageCreateImageFormatPropertiesList[]` be defined as follows.
  - If `VkImageCreateInfo::pNext` contains no instance of `VkExternalFormatANDROID` with non-zero `externalFormat`, then `imageCreateImageFormatPropertiesList` is the list of structures obtained by calling `vkGetPhysicalDeviceImageFormatProperties2`, possibly multiple times, as follows:
    - The parameters `VkPhysicalDeviceImageFormatInfo2::format`, `imageType`, `tiling`, `usage`, and `flags` **must** be equal to those in `VkImageCreateInfo`.
    - If `VkImageCreateInfo::pNext` contains an instance of `VkExternalMemoryImageCreateInfo` where `handleTypes` is not `0`, then `VkPhysicalDeviceImageFormatInfo2::pNext` **must** contain an instance of `VkPhysicalDeviceExternalImageFormatInfo` where `handleType` is not `0`; and `vkGetPhysicalDeviceImageFormatProperties2` **must** be called for each handle type in `VkExternalMemoryImageCreateInfo::handleTypes`, successively setting `VkPhysicalDeviceExternalImageFormatInfo::handleType` on each call.
    - If `VkImageCreateInfo::pNext` contains no instance of `VkExternalMemoryImageCreateInfo` or contains an instance where `handleTypes` is `0`, then `VkPhysicalDeviceImageFormatInfo2::pNext` **must** either contain no instance of `VkPhysicalDeviceExternalImageFormatInfo` or contain an instance where `handleType` is `0`.
    - If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `VkPhysicalDeviceImageFormatInfo2::pNext` **must** contain an instance of `VkPhysicalDeviceImageDrmFormatModifierInfoEXT` where `sharingMode` is equal to `VkImageCreateInfo::sharingMode`; and, if `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, then `queueFamilyIndexCount` and `pQueueFamilyIndices` **must** be equal to those in `VkImageCreateInfo`; and, if `flags` contains `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, then the instance of `VkImageFormatListCreateInfoKHR` in the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` **must** be equivalent to the one in the `pNext` chain of `VkImageCreateInfo`; and `vkGetPhysicalDeviceImageFormatProperties2` **must** be called for each modifier in `imageCreateDrmFormatModifiers`, successively setting `VkPhysicalDeviceImageDrmFormatModifierInfoEXT::drmFormatModifier` on each call.
    - If `tiling` is not `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `VkPhysicalDeviceImageFormatInfo2::pNext` **must** contain no instance of `VkPhysicalDeviceImageDrmFormatModifierInfoEXT`.

- If any call to `vkGetPhysicalDeviceImageFormatProperties2` returns an error, then `imageCreateInfoPropertiesList` is defined to be the empty list.
- If `VkImageCreateInfo::pNext` contains an instance of `VkExternalFormatANDROID` with non-zero `externalFormat`, then `imageCreateInfoPropertiesList` contains a single element where:
  - `VkImageFormatProperties::maxMipLevels` is  $\log_2(\max(extent.width, extent.height, extent.depth)) + 1$ .
  - `VkImageFormatProperties::maxArrayLayers` is `VkPhysicalDeviceLimits::maxImageArrayLayers`.
  - Each component of `VkImageFormatProperties::maxExtent` is `VkPhysicalDeviceLimits::maxImageDimension2D`.
  - `VkImageFormatProperties::sampleCounts` contains exactly `VK_SAMPLE_COUNT_1_BIT`.
- Let `uint32_t imageCreateMaxMipLevels` be the minimum value of `VkImageFormatProperties::maxMipLevels` in `imageCreateInfoPropertiesList`. The value is undefined if `imageCreateInfoPropertiesList` is empty.
- Let `uint32_t imageCreateMaxArrayLayers` be the minimum value of `VkImageFormatProperties::maxArrayLayers` in `imageCreateInfoPropertiesList`. The value is undefined if `imageCreateInfoPropertiesList` is empty.
- Let `VkExtent3D imageCreateMaxExtent` be the component-wise minimum over all `VkImageFormatProperties::maxExtent` values in `imageCreateInfoPropertiesList`. The value is undefined if `imageCreateInfoPropertiesList` is empty.
- Let `VkSampleCountFlags imageCreateSampleCounts` be the intersection of each `VkImageFormatProperties::sampleCounts` in `imageCreateInfoPropertiesList`. The value is undefined if `imageCreateInfoPropertiesList` is empty.

## Valid Usage

- Each of the following values (as described in [Image Creation Limits](#)) **must** not be undefined `imageCreateMaxMipLevels`, `imageCreateMaxArrayLayers`, `imageCreateMaxExtent`, and `imageCreateSampleCounts`.
- If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `pQueueFamilyIndices` **must** be a valid pointer to an array of `queueFamilyIndexCount uint32_t` values
- If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `queueFamilyIndexCount` **must** be greater than 1
- If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` **must** be unique and **must** be less than `pQueueFamilyPropertyCount` returned by either `vkGetPhysicalDeviceQueueFamilyProperties` or `vkGetPhysicalDeviceQueueFamilyProperties2` for the `physicalDevice` that was used to create `device`
- If the `pNext` chain contains an instance of `VkExternalFormatANDROID`, and its member `externalFormat` is non-zero the `format` **must** be `VK_FORMAT_UNDEFINED`.
- If the `pNext` chain does not contain an instance of `VkExternalFormatANDROID`, or does and its member `externalFormat` is 0 the `format` **must** not be `VK_FORMAT_UNDEFINED`.
- `extent::width` **must** be greater than 0.
- `extent::height` **must** be greater than 0.
- `extent::depth` **must** be greater than 0.
- `mipLevels` **must** be greater than 0
- `arrayLayers` **must** be greater than 0
- If `flags` contains `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`, `imageType` **must** be `VK_IMAGE_TYPE_2D`
- If `flags` contains `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`, `imageType` **must** be `VK_IMAGE_TYPE_2D`
- If `flags` contains `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT`, `imageType` **must** be `VK_IMAGE_TYPE_3D`
- `extent.width` **must** be less than or equal to `imageCreateMaxExtent.width` (as defined in [Image Creation Limits](#)).
- `extent.height` **must** be less than or equal to `imageCreateMaxExtent.height` (as defined in [Image Creation Limits](#)).
- `extent.depth` **must** be less than or equal to `imageCreateMaxExtent.depth` (as defined in [Image Creation Limits](#)).
- If `imageType` is `VK_IMAGE_TYPE_2D` and `flags` contains `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`, `extent.width` and `extent.height` **must** be equal and `arrayLayers` **must** be greater than or equal to 6
- If `imageType` is `VK_IMAGE_TYPE_1D`, both `extent.height` and `extent.depth` **must** be 1
- If `imageType` is `VK_IMAGE_TYPE_2D`, `extent.depth` **must** be 1
- `mipLevels` **must** be less than or equal to the number of levels in the complete mipmap

chain based on `extent.width`, `extent.height`, and `extent.depth`.

- `mipLevels` **must** be less than or equal to `imageCreateMaxMipLevels` (as defined in [Image Creation Limits](#)).
- `arrayLayers` **must** be less than or equal to `imageCreateMaxArrayLayers` (as defined in [Image Creation Limits](#)).
- If `imageType` is `VK_IMAGE_TYPE_3D`, `arrayLayers` **must** be 1.
- If `samples` is not `VK_SAMPLE_COUNT_1_BIT`, then `imageType` **must** be `VK_IMAGE_TYPE_2D`, `flags` **must** not contain `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`, `mipLevels` **must** be equal to 1, and `imageCreateMaybeLinear` (as defined in [Image Creation Limits](#)) **must** be `false`,
- If `samples` is not `VK_SAMPLE_COUNT_1_BIT`, `usage` **must** not contain `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`
- If `usage` includes `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, then bits other than `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` **must** not be set
- If `usage` includes `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, `extent.width` **must** be less than or equal to `VkPhysicalDeviceLimits::maxFramebufferWidth`
- If `usage` includes `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, `extent.height` **must** be less than or equal to `VkPhysicalDeviceLimits::maxFramebufferHeight`
- If `usage` includes `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`, `extent.width` **must** be less than or equal to  $\lceil \frac{\text{maxFramebufferWidth}}{\text{minFragmentDensityTexelSize}_{\text{width}}} \rceil$
- If `usage` includes `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`, `extent.height` **must** be less than or equal to  $\lceil \frac{\text{maxFramebufferHeight}}{\text{minFragmentDensityTexelSize}_{\text{height}}} \rceil$
- If `usage` includes `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, `usage` **must** also contain at least one of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.
- `samples` **must** be a bit value that is set in `imageCreateSampleCounts` (as defined in [Image Creation Limits](#)).
- If the `multisampled storage images` feature is not enabled, and `usage` contains `VK_IMAGE_USAGE_STORAGE_BIT`, `samples` **must** be `VK_SAMPLE_COUNT_1_BIT`
- If the `sparse bindings` feature is not enabled, `flags` **must** not contain `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`
- If the `sparse aliased residency` feature is not enabled, `flags` **must** not contain `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT`
- If `imageType` is `VK_IMAGE_TYPE_1D`, `flags` **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`
- If the `sparse residency for 2D images` feature is not enabled, and `imageType` is `VK_IMAGE_TYPE_2D`, `flags` **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`
- If the `sparse residency for 3D images` feature is not enabled, and `imageType` is

`VK_IMAGE_TYPE_3D`, `flags` **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

- If the `sparse residency for images with 2 samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_2_BIT`, `flags` **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`
- If the `sparse residency for images with 4 samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_4_BIT`, `flags` **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`
- If the `sparse residency for images with 8 samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_8_BIT`, `flags` **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`
- If the `sparse residency for images with 16 samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_16_BIT`, `flags` **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`
- If `flags` contains `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT`, it **must** also contain `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`
- If any of the bits `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` are set, `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` **must** not also be set
- If the protected memory feature is not enabled, `flags` **must** not contain `VK_IMAGE_CREATE_PROTECTED_BIT`.
- If any of the bits `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` are set, `VK_IMAGE_CREATE_PROTECTED_BIT` **must** not also be set.
- If the `pNext` chain contains an instance of `VkExternalMemoryImageCreateInfoNV`, it **must** not contain an instance of `VkExternalMemoryImageCreateInfo`.
- If the `pNext` chain contains an instance of `VkExternalMemoryImageCreateInfo`, its `handleTypes` member **must** only contain bits that are also in `VkExternalImageFormatProperties::externalMemoryProperties.compatibleHandleTypes`, as returned by `vkGetPhysicalDeviceImageFormatProperties2` with `format`, `imageType`, `tiling`, `usage`, and `flags` equal to those in this structure, and with an instance of `VkPhysicalDeviceExternalImageFormatInfo` in the `pNext` chain, with a `handleType` equal to any one of the handle types specified in `VkExternalMemoryImageCreateInfo::handleTypes`
- If the `pNext` chain contains an instance of `VkExternalMemoryImageCreateInfoNV`, its `handleTypes` member **must** only contain bits that are also in `VkExternalImageFormatPropertiesNV::externalMemoryProperties.compatibleHandleTypes`, as returned by `vkGetPhysicalDeviceExternalImageFormatPropertiesNV` with `format`, `imageType`, `tiling`, `usage`, and `flags` equal to those in this structure, and with `externalHandleType` equal to any one of the handle types specified in `VkExternalMemoryImageCreateInfoNV::handleTypes`
- If the logical device was created with `VkDeviceGroupDeviceCreateInfo::physicalDeviceCount` equal to 1, `flags` **must** not contain `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT`
- If `flags` contains `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT`, then `mipLevels` **must**

be one, `arrayLayers` **must** be one, `imageType` **must** be `VK_IMAGE_TYPE_2D`, and `imageCreateMaybeLinear` (as defined in [Image Creation Limits](#)) **must** be `false`.

- If `flags` contains `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT`, then `format` **must** be a block-compressed image format, an ETC compressed image format, or an ASTC compressed image format.
- If `flags` contains `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT`, then `flags` **must** also contain `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`.
- `initialLayout` **must** be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`.
- If the `pNext` chain includes a `VkExternalMemoryImageCreateInfo` or `VkExternalMemoryImageCreateInfoNV` structure whose `handleTypes` member is not `0`, `initialLayout` **must** be `VK_IMAGE_LAYOUT_UNDEFINED`
- If the image `format` is one of those listed in [Formats requiring sampler Y'CbCr conversion for VK\\_IMAGE\\_ASPECT\\_COLOR\\_BIT image views](#), then `mipLevels` **must** be 1
- If the image `format` is one of those listed in [Formats requiring sampler Y'CbCr conversion for VK\\_IMAGE\\_ASPECT\\_COLOR\\_BIT image views](#), `samples` must be `VK_SAMPLE_COUNT_1_BIT`
- If the image `format` is one of those listed in [Formats requiring sampler Y'CbCr conversion for VK\\_IMAGE\\_ASPECT\\_COLOR\\_BIT image views](#), `imageType` **must** be `VK_IMAGE_TYPE_2D`
- If the image `format` is one of those listed in [Formats requiring sampler Y'CbCr conversion for VK\\_IMAGE\\_ASPECT\\_COLOR\\_BIT image views](#), and the `ycbcrImageArrays` feature is not enabled, `arrayLayers` **must** be 1
- If `format` is a *multi-planar* format, and if `imageCreateFormatFeatures` (as defined in [Image Creation Limits](#)) does not contain `VK_FORMAT_FEATURE_DISJOINT_BIT`, then `flags` **must** not contain `VK_IMAGE_CREATE_DISJOINT_BIT`.
- If `format` is not a *multi-planar* format, and `flags` does not include `VK_IMAGE_CREATE_ALIAS_BIT`, `flags` **must** not contain `VK_IMAGE_CREATE_DISJOINT_BIT`
- If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the `pNext` chain **must** contain exactly one of `VkImageDrmFormatModifierListCreateInfoEXT` or `VkImageDrmFormatModifierExplicitCreateInfoEXT`.
- If the `pNext` chain contains `VkImageDrmFormatModifierListCreateInfoEXT` or `VkImageDrmFormatModifierExplicitCreateInfoEXT`, then `tiling` **must** be `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`.
- If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and `flags` contains `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, then the `pNext` chain **must** contain `VkImageFormatListCreateInfoKHR` with non-zero `viewFormatCount`.
- If `flags` contains `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` `format` **must** be a depth or depth/stencil format
- If the `pNext` chain includes a `VkExternalMemoryImageCreateInfo` structure whose `handleTypes` member includes `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, `imageType` **must** be `VK_IMAGE_TYPE_2D`.
- If the `pNext` chain includes a `VkExternalMemoryImageCreateInfo` structure whose `handleTypes` member includes

`VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID`, `mipLevels` **must** either be 1 or equal to the number of levels in the complete mipmap chain based on `extent.width`, `extent.height`, and `extent.depth`.

- If the `pNext` chain includes a `VkExternalFormatANDROID` structure whose `externalFormat` member is not 0, `flags` **must** not include `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`.
- If the `pNext` chain includes a `VkExternalFormatANDROID` structure whose `externalFormat` member is not 0, `usage` **must** not include any usages except `VK_IMAGE_USAGE_SAMPLED_BIT`.
- If the `pNext` chain includes a `VkExternalFormatANDROID` structure whose `externalFormat` member is not 0, `tiling` **must** be `VK_IMAGE_TILING_OPTIMAL`.
- If `format` is a depth-stencil format, `usage` **includes** `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and the `pNext` chain contains an instance of `VkImageStencilUsageCreateInfoEXT`, then `VkImageStencilUsageCreateInfoEXT::stencilUsage` member **must** also include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- If `format` is a depth-stencil format, `usage` does not include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and the `pNext` chain contains an instance of `VkImageStencilUsageCreateInfoEXT`, then `VkImageStencilUsageCreateInfoEXT::stencilUsage` member **must** also not include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`
- If `format` is a depth-stencil format, `usage` **includes** `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, and the `pNext` chain contains an instance of `VkImageStencilUsageCreateInfoEXT`, then `VkImageStencilUsageCreateInfoEXT::stencilUsage` member **must** also include `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`
- If `format` is a depth-stencil format, `usage` does not include `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, and the `pNext` chain contains an instance of `VkImageStencilUsageCreateInfoEXT`, then `VkImageStencilUsageCreateInfoEXT::stencilUsage` member **must** also not include `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`
- If `Format` is a depth-stencil format and the `pNext` chain contains an instance of `VkImageStencilUsageCreateInfoEXT` with its `stencilUsage` member including `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, `extent.width` **must** be less than or equal to `VkPhysicalDeviceLimits::maxFramebufferWidth`
- If `format` is a depth-stencil format and the `pNext` chain contains an instance of `VkImageStencilUsageCreateInfoEXT` with its `stencilUsage` member including `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, `extent.height` **must** be less than or equal to `VkPhysicalDeviceLimits::maxFramebufferHeight`
- If the `multisampled storage images` feature is not enabled, `format` is a depth-stencil format and the `pNext` chain contains an instance of `VkImageStencilUsageCreateInfoEXT` with its `stencilUsage` including `VK_IMAGE_USAGE_STORAGE_BIT`, `samples` **must** be `VK_SAMPLE_COUNT_1_BIT`
- If `flags` contains `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV`, `imageType` **must** be `VK_IMAGE_TYPE_2D` or `VK_IMAGE_TYPE_3D`
- If `flags` contains `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV`, it **must** not contain `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT` and the `format` **must** not be a depth/stencil format
- If `flags` contains `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` and `imageType` is `VK_IMAGE_TYPE_2D`,

`extent::width` and `extent::height` **must** be greater than 1

- If `flags` contains `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` and `imageType` is `VK_IMAGE_TYPE_3D`, `extent::width`, `extent::height`, and `extent::depth` **must** be greater than 1
- If `usage` includes `VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV`, `imageType` **must** be `VK_IMAGE_TYPE_2D`.
- If `usage` includes `VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV`, `samples` **must** be `VK_SAMPLE_COUNT_1_BIT`.
- If `usage` includes `VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV`, `tiling` **must** be `VK_IMAGE_TILING_OPTIMAL`.
- If `flags` contains `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`, `tiling` **must** be `VK_IMAGE_TILING_OPTIMAL`
- If `flags` contains `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`, `imageType` **must** be `VK_IMAGE_TYPE_2D`
- If `flags` contains `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`, `flags` **must** not contain `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`
- If `flags` contains `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`, `mipLevels` **must** be 1

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkDedicatedAllocationImageCreateInfoNV`, `VkExternalFormatANDROID`, `VkExternalMemoryImageCreateInfo`, `VkExternalMemoryImageCreateInfoNV`, `VkImageDrmFormatModifierExplicitCreateInfoEXT`, `VkImageDrmFormatModifierListCreateInfoEXT`, `VkImageFormatListCreateInfoKHR`, `VkImageStencilUsageCreateInfoEXT`, or `VkImageSwapchainCreateInfoKHR`
- Each `sType` member in the `pNext` chain **must** be unique
- `flags` **must** be a valid combination of `VkImageCreateFlagBits` values
- `imageType` **must** be a valid `VkImageType` value
- `format` **must** be a valid `VkFormat` value
- `samples` **must** be a valid `VkSampleCountFlagBits` value
- `tiling` **must** be a valid `VkImageTiling` value
- `usage` **must** be a valid combination of `VkImageUsageFlagBits` values
- `usage` **must** not be 0
- `sharingMode` **must** be a valid `VkSharingMode` value
- `initialLayout` **must** be a valid `VkImageLayout` value

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageStencilUsageCreateInfoEXT` structure, then that structure includes the usage flags specific to the stencil aspect of the image for an image

with a depth-stencil format.

The `VkImageStencilUsageCreateInfoEXT` structure is defined as:

```
typedef struct VkImageStencilUsageCreateInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkImageUsageFlags  stencilUsage;
} VkImageStencilUsageCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `stencilUsage` is a bitmask of `VkImageUsageFlagBits` describing the intended usage of the stencil aspect of the image.

This structure specifies image usages which only apply to the stencil aspect of a depth/stencil format image. When this structure is included in the `pNext` chain of `VkImageCreateInfo`, the stencil aspect of the image **must** only be used as specified by `stencilUsage`. When this structure is not included in the `pNext` chain of `VkImageCreateInfo`, the stencil aspect of an image **must** only be used as specified `VkImageCreateInfo::usage`. Use of other aspects of an image are unaffected by this structure.

This structure **can** also be included in the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` to query additional capabilities specific to image creation parameter combinations including a separate set of usage flags for the stencil aspect of the image using `vkGetPhysicalDeviceImageFormatProperties2`. When this structure is not present in the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` then the implicit value of `stencilUsage` matches that of `VkPhysicalDeviceImageFormatInfo2::usage`.

## Valid Usage

- If `stencilUsage` includes `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, it **must** not include bits other than `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_STENCIL_USAGE_CREATE_INFO_EXT`
- `stencilUsage` **must** be a valid combination of `VkImageUsageFlagBits` values
- `stencilUsage` **must** not be `0`

If the `pNext` chain includes a `VkDedicatedAllocationImageCreateInfoNV` structure, then that structure includes an enable controlling whether the image will have a dedicated memory allocation bound to it.

The `VkDedicatedAllocationImageCreateInfoNV` structure is defined as:

```
typedef struct VkDedicatedAllocationImageCreateInfoNV {
    VkStructureType    sType;
    const void*        pNext;
    VkBool32           dedicatedAllocation;
} VkDedicatedAllocationImageCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `dedicatedAllocation` specifies whether the image will have a dedicated allocation bound to it.

*Note*

Using a dedicated allocation for color and depth/stencil attachments or other large images **may** improve performance on some devices.

## Valid Usage

- If `dedicatedAllocation` is `VK_TRUE`, `VkImageCreateInfo::flags` **must** not include `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DEDICATED_ALLOCATION_IMAGE_CREATE_INFO_NV`

To define a set of external memory handle types that **may** be used as backing store for an image, add a `VkExternalMemoryImageCreateInfo` structure to the `pNext` chain of the `VkImageCreateInfo` structure. The `VkExternalMemoryImageCreateInfo` structure is defined as:

```
typedef struct VkExternalMemoryImageCreateInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkExternalMemoryHandleTypeFlags   handleTypes;
} VkExternalMemoryImageCreateInfo;
```

or the equivalent

```
typedef VkExternalMemoryImageCreateInfo VkExternalMemoryImageCreateInfoKHR;
```

*Note*

An instance of `VkExternalMemoryImageCreateInfo` must be included in the creation parameters for an image that will be bound to memory that is either exported or imported.

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `handleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more external memory handle types.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO`
- `handleTypes` **must** be a valid combination of `VkExternalMemoryHandleTypeFlagBits` values
- `handleTypes` **must** not be `0`

If the `pNext` chain includes a `VkExternalMemoryImageCreateInfoNV` structure, then that structure defines a set of external memory handle types that **may** be used as backing store for the image.

The `VkExternalMemoryImageCreateInfoNV` structure is defined as:

```
typedef struct VkExternalMemoryImageCreateInfoNV {  
    VkStructureType           sType;  
    const void*               pNext;  
    VkExternalMemoryHandleTypeFlagsNV handleTypes;  
} VkExternalMemoryImageCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `handleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBitsNV` specifying one or more external memory handle types.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO_NV`
- `handleTypes` **must** be a valid combination of `VkExternalMemoryHandleTypeFlagBitsNV` values

To create an image with an `external format`, include an instance of `VkExternalFormatANDROID` in the `pNext` chain of `VkImageCreateInfo`. `VkExternalFormatANDROID` is defined as:

```
typedef struct VkExternalFormatANDROID {
    VkStructureType    sType;
    void*              pNext;
    uint64_t            externalFormat;
} VkExternalFormatANDROID;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `externalFormat` is an implementation-defined identifier for the external format

If `externalFormat` is zero, the effect is as if the `VkExternalFormatANDROID` structure was not present. Otherwise, the `image` will have the specified external format.

## Valid Usage

- `externalFormat` **must** be `0` or a value returned in the `externalFormat` member of `VkAndroidHardwareBufferFormatPropertiesANDROID` by an earlier call to `vkGetAndroidHardwareBufferPropertiesANDROID`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_EXTERNAL_FORMAT_ANDROID`

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageSwapchainCreateInfoKHR` structure, then that structure includes a swapchain handle indicating that the image will be bound to memory from that swapchain.

The `VkImageSwapchainCreateInfoKHR` structure is defined as:

```
typedef struct VkImageSwapchainCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSwapchainKHR     swapchain;
} VkImageSwapchainCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `swapchain` is `VK_NULL_HANDLE` or a handle of a swapchain that the image will be bound to.

## Valid Usage

- If `swapchain` is not `VK_NULL_HANDLE`, the fields of `VkImageCreateInfo` **must** match the implied image creation parameters of the swapchain

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR`
- If `swapchain` is not `VK_NULL_HANDLE`, `swapchain` **must** be a valid `VkSwapchainKHR` handle

If the `pNext` list of `VkImageCreateInfo` includes a `VkImageFormatListCreateInfoKHR` structure, then that structure contains a list of all formats that **can** be used when creating views of this image.

The `VkImageFormatListCreateInfoKHR` structure is defined as:

```
typedef struct VkImageFormatListCreateInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           viewFormatCount;
    const VkFormat*    pViewFormats;
} VkImageFormatListCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is **NULL** or a pointer to an extension-specific structure.
- `viewFormatCount` is the number of entries in the `pViewFormats` array.
- `pViewFormats` is an array which lists of all formats which **can** be used when creating views of this image.

If `viewFormatCount` is zero, `pViewFormats` is ignored and the image is created as if the `VkImageFormatListCreateInfoKHR` structure were not included in the `pNext` list of `VkImageCreateInfo`.

## Valid Usage

- If `viewFormatCount` is not `0`, all of the formats in the `pViewFormats` array **must** be compatible with the format specified in the `format` field of `VkImageCreateInfo`, as described in the compatibility table.
- If `VkImageCreateInfo::flags` does not contain `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, `viewFormatCount` **must** be `0` or `1`.
- If `viewFormatCount` is not `0`, `VkImageCreateInfo::format` **must** be in `pViewFormats`.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_IMAGE_FORMAT_LIST_CREATE_INFO_KHR`
- If `viewFormatCount` is not `0`, `pViewFormats` must be a valid pointer to an array of `viewFormatCount` valid `VkFormat` values

If the `pNext` chain of `VkImageCreateInfo` contains `VkImageDrmFormatModifierListCreateInfoEXT`, then the image will be created with one of the [Linux DRM format modifiers](#) listed in the structure. The choice of modifier is implementation-dependent.

The `VkImageDrmFormatModifierListCreateInfoEXT` structure is defined as:

```
typedef struct VkImageDrmFormatModifierListCreateInfoEXT {  
    VkStructureType      sType;  
    const void*          pNext;  
    uint32_t              drmFormatModifierCount;  
    const uint64_t*       pDrmFormatModifiers;  
} VkImageDrmFormatModifierListCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `drmFormatModifierCount` is the length of the `pDrmFormatModifiers` array.
- `pDrmFormatModifiers` is a pointer to an array of *Linux DRM format modifiers*.

## Valid Usage

- Each *modifier* in `pDrmFormatModifiers` must be compatible with the parameters in `VkImageCreateInfo` and its `pNext` chain, as determined by querying `VkPhysicalDeviceImageFormatInfo2` extended with `VkPhysicalDeviceImageDrmFormatModifierInfoEXT`.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_LIST_CREATE_INFO_EXT`
- `pDrmFormatModifiers` must be a valid pointer to an array of `drmFormatModifierCount` `uint64_t` values
- `drmFormatModifierCount` must be greater than `0`

If the `pNext` chain of `VkImageCreateInfo` contains `VkImageDrmFormatModifierExplicitCreateInfoEXT`, then the image will be created with the [Linux DRM format modifier](#) and memory layout defined by the structure.

The `VkImageDrmFormatModifierExplicitCreateInfoEXT` structure is defined as:

```
typedef struct VkImageDrmFormatModifierExplicitCreateInfoEXT {
    VkStructureType          sType;
    const void*               pNext;
    uint64_t                  drmFormatModifier;
    uint32_t                  drmFormatModifierPlaneCount;
    const VkSubresourceLayout* pPlaneLayouts;
} VkImageDrmFormatModifierExplicitCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `drmFormatModifier` is the *Linux DRM format modifier* with which the image will be created.
- `drmFormatModifierPlaneCount` is the number of *memory planes* in the image (as reported by `VkDrmFormatModifierPropertiesEXT`) as well as the length of the `pPlaneLayouts` array.
- `pPlaneLayouts` is a pointer to an array of `VkSubresourceLayout` structures describing the image's *memory planes*.

The  $i^{\text{th}}$  member of `pPlaneLayouts` describes the layout of the image's  $i^{\text{th}}$  *memory plane* (that is, `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT`). In each element of `pPlaneLayouts`, the implementation **must** ignore `size`. The implementation calculates the size of each plane, which the application **can** query with `vkGetImageSubresourceLayout`.

When creating an image with `VkImageDrmFormatModifierExplicitCreateInfoEXT`, it is the application's responsibility to satisfy all valid usage requirements. However, the implementation **must** validate that the provided `pPlaneLayouts`, when combined with the provided `drmFormatModifier` and other creation parameters in `VkImageCreateInfo` and its `pNext` chain, produce a valid image. (This validation is necessarily implementation-dependent and outside the scope of Vulkan, and therefore not described by valid usage requirements). If this validation fails, then `vkCreateImage` returns `VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT`.

## Valid Usage

- `drmFormatModifier` must be compatible with the parameters in `VkImageCreateInfo` and its `pNext` chain, as determined by querying `VkPhysicalDeviceImageFormatInfo2` extended with `VkPhysicalDeviceImageDrmFormatModifierInfoEXT`.
- `drmFormatModifierPlaneCount` **must** be equal to the `VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount` associated with `VkImageCreateInfo::format` and `drmFormatModifier`, as found by querying `VkDrmFormatModifierPropertiesListEXT`.
- For each element of `pPlaneLayouts`, `size` **must** be 0
- For each element of `pPlaneLayouts`, `arrayPitch` **must** be 0 if `VkImageCreateInfo::arrayLayers` is 1.
- For each element of `pPlaneLayouts`, `depthPitch` **must** be 0 if `VkImageCreateInfo::extent::depth` is 1.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_EXPLICIT_CREATE_INFO_EXT`
- If `drmFormatModifierPlaneCount` is not 0, `pPlaneLayouts` **must** be a valid pointer to an array of `drmFormatModifierPlaneCount` `VkSubresourceLayout` structures

Bits which **can** be set in `VkImageCreateInfo::usage`, specifying intended usage of an image, are:

```
typedef enum VkImageUsageFlagBits {
    VK_IMAGE_USAGE_TRANSFER_SRC_BIT = 0x00000001,
    VK_IMAGE_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_IMAGE_USAGE_SAMPLED_BIT = 0x00000004,
    VK_IMAGE_USAGE_STORAGE_BIT = 0x00000008,
    VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT = 0x00000010,
    VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT = 0x00000020,
    VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT = 0x00000040,
    VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT = 0x00000080,
    VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV = 0x00000100,
    VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT = 0x00000200,
    VK_IMAGE_USAGE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkImageUsageFlagBits;
```

- `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` specifies that the image **can** be used as the source of a transfer command.
- `VK_IMAGE_USAGE_TRANSFER_DST_BIT` specifies that the image **can** be used as the destination of a transfer command.
- `VK_IMAGE_USAGE_SAMPLED_BIT` specifies that the image **can** be used to create a `VkImageView` suitable for occupying a `VkDescriptorSet` slot either of type `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and be sampled by a shader.

- `VK_IMAGE_USAGE_STORAGE_BIT` specifies that the image **can** be used to create a `VkImageView` suitable for occupying a `VkDescriptorSet` slot of type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`.
- `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` specifies that the image **can** be used to create a `VkImageView` suitable for use as a color or resolve attachment in a `VkFramebuffer`.
- `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` specifies that the image **can** be used to create a `VkImageView` suitable for use as a depth/stencil or depth/stencil resolve attachment in a `VkFramebuffer`.
- `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` specifies that the memory bound to this image will have been allocated with the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` (see [Memory Allocation](#) for more detail). This bit **can** be set for any image that **can** be used to create a `VkImageView` suitable for use as a color, resolve, depth/stencil, or input attachment.
- `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` specifies that the image **can** be used to create a `VkImageView` suitable for occupying `VkDescriptorSet` slot of type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`; be read from a shader as an input attachment; and be used as an input attachment in a framebuffer.
- `VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV` specifies that the image **can** be used to create a `VkImageView` suitable for use as a [shading rate image](#).
- `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT` specifies that the image **can** be used to create a `VkImageView` suitable for use as a [fragment density map image](#).

```
typedef VkFlags VkImageUsageFlags;
```

`VkImageUsageFlags` is a bitmask type for setting a mask of zero or more `VkImageUsageFlagBits`.

Bits which **can** be set in `VkImageCreateInfo::flags`, specifying additional parameters of an image, are:

```

typedef enum VkImageCreateFlagBits {
    VK_IMAGE_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_IMAGE_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
    VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT = 0x00000008,
    VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT = 0x00000010,
    VK_IMAGE_CREATE_ALIAS_BIT = 0x00004000,
    VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT = 0x00000040,
    VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT = 0x00000020,
    VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT = 0x00000080,
    VK_IMAGE_CREATE_EXTENDED_USAGE_BIT = 0x00000100,
    VK_IMAGE_CREATE_PROTECTED_BIT = 0x00000800,
    VK_IMAGE_CREATE_DISJOINT_BIT = 0x00000200,
    VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV = 0x00002000,
    VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT = 0x00001000,
    VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT = 0x00004000,
    VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR =
VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT,
    VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT_KHR =
VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT,
    VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT_KHR =
VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT,
    VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR = VK_IMAGE_CREATE_EXTENDED_USAGE_BIT,
    VK_IMAGE_CREATE_DISJOINT_BIT_KHR = VK_IMAGE_CREATE_DISJOINT_BIT,
    VK_IMAGE_CREATE_ALIAS_BIT_KHR = VK_IMAGE_CREATE_ALIAS_BIT,
    VK_IMAGE_CREATE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkImageCreateFlagBits;

```

- `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` specifies that the image will be backed using sparse memory binding.
- `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` specifies that the image **can** be partially backed using sparse memory binding. Images created with this flag **must** also be created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` flag.
- `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` specifies that the image will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another image (or another portion of the same image). Images created with this flag **must** also be created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` flag
- `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` specifies that the image **can** be used to create a `VkImageView` with a different format from the image. For `multi-planar` formats, `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` specifies that a `VkImageView` can be created of a *plane* of the image.
- `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT` specifies that the image **can** be used to create a `VkImageView` of type `VK_IMAGE_VIEW_TYPE_CUBE` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.
- `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` specifies that the image **can** be used to create a `VkImageView` of type `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`.
- `VK_IMAGE_CREATE_PROTECTED_BIT` specifies that the image is a protected image.

- `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` specifies that the image **can** be used with a non-zero value of the `splitInstanceBindRegionCount` member of a `VkBindImageMemoryDeviceGroupInfo` structure passed into `vkBindImageMemory2`. This flag also has the effect of making the image use the standard sparse image block dimensions.
- `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` specifies that the image having a compressed format **can** be used to create a `VkImageView` with an uncompressed format where each texel in the image view corresponds to a compressed texel block of the image.
- `VK_IMAGE_CREATE_EXTENDED_USAGE_BIT` specifies that the image **can** be created with usage flags that are not supported for the format the image is created with but are supported for at least one format a `VkImageView` created from the image **can** have.
- `VK_IMAGE_CREATE_DISJOINT_BIT` specifies that an image with a `multi-planar format` **must** have each plane separately bound to memory, rather than having a single memory binding for the whole image; the presence of this bit distinguishes a *disjoint image* from an image without this bit set.
- `VK_IMAGE_CREATE_ALIAS_BIT` specifies that two images created with the same creation parameters and aliased to the same memory **can** interpret the contents of the memory consistently with each other, subject to the rules described in the [Memory Aliasing](#) section. This flag further specifies that each plane of a *disjoint* image **can** share an in-memory non-linear representation with single-plane images, and that a single-plane image **can** share an in-memory non-linear representation with a plane of a multi-planar disjoint image, according to the rules in [Compatible formats of planes of multi-planar formats](#). If the `pNext` chain includes a `VkExternalMemoryImageCreateInfo` or `VkExternalMemoryImageCreateInfoNV` structure whose `handleTypes` member is not `0`, it is as if `VK_IMAGE_CREATE_ALIAS_BIT` is set.
- `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` specifies that an image with a depth or depth/stencil format **can** be used with custom sample locations when used as a depth/stencil attachment.
- `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` specifies that the image is a [corner-sampled image](#).
- `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT` specifies that an image **can** be in a subsampled format which **may** be more optimal when written as an attachment by a render pass that has a fragment density map attachment. Accessing a subsampled image has additional considerations:
  - Image data read as an image sampler is undefined if the sampler was not created with `flags` containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` or was not sampled through the use of a combined image sampler with an immutable sampler in `VkDescriptorSetLayoutBinding`.
  - Image data read with an input attachment is undefined if the contents were not written as an attachment in an earlier subpass of the same render pass.
  - Image data read with load operations **may** be resampled to the fragment density of the render pass.
  - Image contents outside of the render area become undefined if the image is stored as a render pass attachment.

See [Sparse Resource Features](#) and [Sparse Physical Device Features](#) for more details.

```
typedef VkFlags VkImageCreateFlags;
```

`VkImageCreateFlags` is a bitmask type for setting a mask of zero or more `VkImageCreateFlagBits`.

Possible values of `VkImageCreateInfo::imageType`, specifying the basic dimensionality of an image, are:

```
typedef enum VkImageType {
    VK_IMAGE_TYPE_1D = 0,
    VK_IMAGE_TYPE_2D = 1,
    VK_IMAGE_TYPE_3D = 2,
    VK_IMAGE_TYPE_MAX_ENUM = 0x7FFFFFFF
} VkImageType;
```

- `VK_IMAGE_TYPE_1D` specifies a one-dimensional image.
- `VK_IMAGE_TYPE_2D` specifies a two-dimensional image.
- `VK_IMAGE_TYPE_3D` specifies a three-dimensional image.

Possible values of `VkImageCreateInfo::tiling`, specifying the tiling arrangement of texel blocks in an image, are:

```
typedef enum VkImageTiling {
    VK_IMAGE_TILING_OPTIMAL = 0,
    VK_IMAGE_TILING_LINEAR = 1,
    VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT = 1000158000,
    VK_IMAGE_TILING_MAX_ENUM = 0x7FFFFFFF
} VkImageTiling;
```

- `VK_IMAGE_TILING_OPTIMAL` specifies optimal tiling (texels are laid out in an implementation-dependent arrangement, for more optimal memory access).
- `VK_IMAGE_TILING_LINEAR` specifies linear tiling (texels are laid out in memory in row-major order, possibly with some padding on each row).
- `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` indicates that the image's tiling is defined by a [Linux DRM format modifier](#). The modifier is specified at image creation with `VkImageDrmFormatModifierListCreateInfoEXT` or `VkImageDrmFormatModifierExplicitCreateInfoEXT`, and can be queried with `vkGetImageDrmFormatModifierPropertiesEXT`.

To query the memory layout of an image subresource, call:

```
void vkGetImageSubresourceLayout(  
    VkDevice device,  
    VkImage image,  
    const VkImageSubresource* pSubresource,  
    VkSubresourceLayout* pLayout);
```

- `device` is the logical device that owns the image.
- `image` is the image whose layout is being queried.
- `pSubresource` is a pointer to a `VkImageSubresource` structure selecting a specific image for the image subresource.
- `pLayout` is a pointer to a `VkSubresourceLayout` structure in which the layout is returned.

If the image is `linear`, then the returned layout is valid for `host access`.

If the image's tiling is `VK_IMAGE_TILING_LINEAR` and its format is a `multi-planar format`, then `vkGetImageSubresourceLayout` describes one *format plane* of the image. If the image's tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `vkGetImageSubresourceLayout` describes one *memory plane* of the image. If the image's tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and the image is `non-linear`, then the returned layout has an implementation-dependent meaning; the vendor of the image's `DRM format modifier` **may** provide documentation that explains how to interpret the returned layout.

`vkGetImageSubresourceLayout` is invariant for the lifetime of a single image. However, the subresource layout of images in Android hardware buffer external memory is not known until the image has been bound to memory, so applications **must** not call `vkGetImageSubresourceLayout` for such an image before it has been bound.

## Valid Usage

- `image` **must** have been created with `tiling` equal to `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`
- The `aspectMask` member of `pSubresource` **must** only have a single bit set
- The `mipLevel` member of `pSubresource` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- The `arrayLayer` member of `pSubresource` **must** be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- If the `tiling` of the `image` is `VK_IMAGE_TILING_LINEAR` and its `format` is a `multi-planar` format with two planes, the `aspectMask` member of `pSubresource` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT` or `VK_IMAGE_ASPECT_PLANE_1_BIT`
- If the `tiling` of the `image` is `VK_IMAGE_TILING_LINEAR` and its `format` is a `multi-planar` format with three planes, the `aspectMask` member of `pSubresource` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`
- If `image` was created with the `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID` external memory handle type, then `image` **must** be bound to memory.
- If the `tiling` of the `image` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the `aspectMask` member of `pSubresource` **must** be `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` and the index `i` **must** be less than the `drmFormatModifierPlaneCount` associated with the image's `format` and `drmFormatModifier`.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `image` **must** be a valid `VkImage` handle
- `pSubresource` **must** be a valid pointer to a valid `VkImageSubresource` structure
- `pLayout` **must** be a valid pointer to a `VkSubresourceLayout` structure
- `image` **must** have been created, allocated, or retrieved from `device`

The `VkImageSubresource` structure is defined as:

```
typedef struct VkImageSubresource {  
    VkImageAspectFlags aspectMask;  
    uint32_t mipLevel;  
    uint32_t arrayLayer;  
} VkImageSubresource;
```

- `aspectMask` is a `VkImageAspectFlags` selecting the image `aspect`.
- `mipLevel` selects the mipmap level.

- `arrayLayer` selects the array layer.

## Valid Usage (Implicit)

- `aspectMask` must be a valid combination of `VkImageAspectFlagBits` values
- `aspectMask` must not be 0

Information about the layout of the image subresource is returned in a `VkSubresourceLayout` structure:

```
typedef struct VkSubresourceLayout {
    VkDeviceSize    offset;
    VkDeviceSize    size;
    VkDeviceSize    rowPitch;
    VkDeviceSize    arrayPitch;
    VkDeviceSize    depthPitch;
} VkSubresourceLayout;
```

- `offset` is the byte offset from the start of the image or the plane where the image subresource begins.
- `size` is the size in bytes of the image subresource. `size` includes any extra memory that is required based on `rowPitch`.
- `rowPitch` describes the number of bytes between each row of texels in an image.
- `arrayPitch` describes the number of bytes between each array layer of an image.
- `depthPitch` describes the number of bytes between each slice of 3D image.

If the image is `linear`, then `rowPitch`, `arrayPitch` and `depthPitch` describe the layout of the image subresource in linear memory. For uncompressed formats, `rowPitch` is the number of bytes between texels with the same x coordinate in adjacent rows (y coordinates differ by one). `arrayPitch` is the number of bytes between texels with the same x and y coordinate in adjacent array layers of the image (array layer values differ by one). `depthPitch` is the number of bytes between texels with the same x and y coordinate in adjacent slices of a 3D image (z coordinates differ by one). Expressed as an addressing formula, the starting byte of a texel in the image subresource has address:

```
// (x,y,z,layer) are in texel coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x*elementSize +
offset
```

For compressed formats, the `rowPitch` is the number of bytes between compressed texel blocks in adjacent rows. `arrayPitch` is the number of bytes between compressed texel blocks in adjacent array layers. `depthPitch` is the number of bytes between compressed texel blocks in adjacent slices of a 3D image.

```
// (x,y,z,layer) are in compressed texel block coordinates  
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x  
*compressedTexelBlockByteSize + offset;
```

The value of `arrayPitch` is undefined for images that were not created as arrays. `depthPitch` is defined only for 3D images.

If the image has a *single-plane* color format and its tiling is `VK_IMAGE_TILING_LINEAR`, then the `aspectMask` member of `VkImageSubresource` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`.

If the image has a depth/stencil format and its tiling is `VK_IMAGE_TILING_LINEAR`, then `aspectMask` **must** be either `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`. On implementations that store depth and stencil aspects separately, querying each of these image subresource layouts will return a different `offset` and `size` representing the region of memory used for that aspect. On implementations that store depth and stencil aspects interleaved, the same `offset` and `size` are returned and represent the interleaved memory allocation.

If the image has a *multi-planar format* and its tiling is `VK_IMAGE_TILING_LINEAR`, then the `aspectMask` member of `VkImageSubresource` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or (for 3-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`. Querying each of these image subresource layouts will return a different `offset` and `size` representing the region of memory used for that plane. If the image is *disjoint*, then the `offset` is relative to the base address of the plane. If the image is *non-disjoint*, then the `offset` is relative to the base address of the image.

If the image's tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the `aspectMask` member of `VkImageSubresource` **must** be one of `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT`, where the maximum allowed plane index `i` is defined by the `drmFormatModifierPlaneCount` associated with the image's `format` and `modifier`. The memory range used by the subresource is described by `offset` and `size`. If the image is *disjoint*, then the `offset` is relative to the base address of the *memory plane*. If the image is *non-disjoint*, then the `offset` is relative to the base address of the image. If the image is *non-linear*, then `rowPitch`, `arrayPitch`, and `depthPitch` have an implementation-dependent meaning.

If an image was created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the image has a [Linux DRM format modifier](#). To query the *modifier*, call:

```
VkResult vkGetImageDrmFormatModifierPropertiesEXT(  
    VkDevice                               device,  
    VkImage                                image,  
    VkImageDrmFormatModifierPropertiesEXT* pProperties);
```

- `device` is the logical device that owns the image.
- `image` is the queried image.
- `pProperties` will return properties of the image's *DRM format modifier*.

## Valid Usage

- **image must have been created with `tiling` equal to `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`.**

## Valid Usage (Implicit)

- **device must be a valid `VkDevice` handle**
- **image must be a valid `VkImage` handle**
- **pProperties must be a valid pointer to a `VkImageDrmFormatModifierPropertiesEXT` structure**
- **image must have been created, allocated, or retrieved from device**

## Return Codes

### Success

- `VK_SUCCESS`

The `VkImageDrmFormatModifierPropertiesEXT` structure is defined as:

```
typedef struct VkImageDrmFormatModifierPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint64_t drmFormatModifier;
} VkImageDrmFormatModifierPropertiesEXT;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to an extension-specific structure.
- **drmFormatModifier** returns the image's [Linux DRM format modifier](#).

If the `image` was created with `VkImageDrmFormatModifierListCreateInfoEXT`, then the returned `drmFormatModifier` **must** belong to the list of modifiers provided at time of image creation in `VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers`. If the `image` was created with `VkImageDrmFormatModifierExplicitCreateInfoEXT`, then the returned `drmFormatModifier` **must** be the modifier provided at time of image creation in `VkImageDrmFormatModifierExplicitCreateInfoEXT::drmFormatModifier`.

## Valid Usage (Implicit)

- **sType must be `VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_PROPERTIES_EXT`**
- **pNext must be `NULL`**

To destroy an image, call:

```
void vkDestroyImage(  
    VkDevice device,  
    VkImage image,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the image.
- `image` is the image to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- All submitted commands that refer to `image`, either directly or via a `VkImageView`, **must** have completed execution
- If `VkAllocationCallbacks` were provided when `image` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `image` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `image` is not `VK_NULL_HANDLE`, `image` **must** be a valid `VkImage` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `image` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `image` **must** be externally synchronized

### 11.3.1. Image Format Features

Valid usage of a `VkImage` **may** be constrained by the image's format features, defined below. Such constraints are documented in the affected valid usage statement.

- If the image was created with `VK_IMAGE_TILING_LINEAR`, then its set of *format features* is the value of `VkFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same `format` as `VkImageCreateInfo::format`.
- If the image was created with `VK_IMAGE_TILING_OPTIMAL`, but without an `external format`, then its

set of *format features* is the value of `VkFormatProperties::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same `format` as `VkImageCreateInfo::format`.

- If the image was created with an *external format*, then its set of *format features* is the value of `VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures` found by calling `vkGetAndroidHardwareBufferPropertiesANDROID` on the Android hardware buffer that was imported to the `VkDeviceMemory` to which the image is bound.
- If the image was created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then:
  - The image's DRM format modifier is the value of `VkImageDrmFormatModifierListCreateInfoEXT::drmFormatModifier` found by calling `vkGetImageDrmFormatModifierPropertiesEXT`.
  - Let `VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties` be the array found by calling `vkGetPhysicalDeviceFormatProperties2` on the same `format` as `VkImageCreateInfo::format`.
  - Let `VkDrmFormatModifierPropertiesEXT prop` be the array element whose `drmFormatModifier` member is the value of the image's DRM format modifier.
  - Then the image set of *format features* is the value of `prop::drmFormatModifierTilingFeatures`.

### 11.3.2. Corner-Sampled Images

A *corner-sampled image* is an image where unnormalized texel coordinates are centered on integer values rather than half-integer values.

A corner-sampled image has a number of differences compared to conventional texture image:

- Texels are centered on integer coordinates. See [Unnormalized Texel Coordinate Operations](#)
- Normalized coordinates are scaled using  $\text{coord} * (\text{dim} - 1)$  rather than  $\text{coord} * \text{dim}$ , where  $\text{dim}$  is the size of one dimension of the image. See [normalized texel coordinate transform](#).
- Partial derivatives are scaled using  $\text{coord} * (\text{dim} - 1)$  rather than  $\text{coord} * \text{dim}$ . See [Scale Factor Operation](#).
- Calculation of the next higher lod size goes according to  $\text{dim} / 2$  rather than  $\text{dim} / 2$ . See [Image Miplevel Sizing](#).
- The minimum level size is 2x2 for 2D images and 2x2x2 for 3D images. See [Image Miplevel Sizing](#).

Corner-sampling is only supported for 2D and 3D images. When sampling a corner-sampled image, the sampler addressing mode **must** be `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`. Corner-sampled images are not supported as cubemaps or depth/stencil images.

### 11.3.3. Image Miplevel Sizing

A *complete mipmap chain* is the full set of miplevels, from the largest miplevel provided, down to the *minimum miplevel size*.

## Conventional Images

For conventional images, the dimensions of each successive miplevel,  $n+1$ , are:

$$\text{width}_{n+1} = \max(\text{width}_n/2, 1)$$

$$\text{height}_{n+1} = \max(\text{height}_n/2, 1)$$

$$\text{depth}_{n+1} = \max(\text{depth}_n/2, 1)$$

where  $\text{width}_n$ ,  $\text{height}_n$ , and  $\text{depth}_n$  are the dimensions of the next larger miplevel,  $n$ .

The minimum miplevel size is:

- 1 for one-dimensional images,
- 1x1 for two-dimensional images, and
- 1x1x1 for three-dimensional images.

The number of levels in a complete mipmap chain is:

$$\log_2(\max(\text{width}_0, \text{height}_0, \text{depth}_0)) + 1$$

where  $\text{width}_0$ ,  $\text{height}_0$ , and  $\text{depth}_0$  are the dimensions of the largest (most detailed) miplevel,  $0$ .

## Corner-Sampled Images

For corner-sampled images, the dimensions of each successive miplevel,  $n+1$ , are:

$$\text{width}_{n+1} = \max(\text{width}_n/2, 2)$$

$$\text{height}_{n+1} = \max(\text{height}_n/2, 2)$$

$$\text{depth}_{n+1} = \max(\text{depth}_n/2, 2)$$

where  $\text{width}_n$ ,  $\text{height}_n$ , and  $\text{depth}_n$  are the dimensions of the next larger miplevel,  $n$ .

The minimum miplevel size is:

- 2x2 for two-dimensional images, and
- 2x2x2 for three-dimensional images.

The number of levels in a complete mipmap chain is:

$$\log_2(\max(\text{width}_0, \text{height}_0, \text{depth}_0))$$

where  $\text{width}_0$ ,  $\text{height}_0$ , and  $\text{depth}_0$  are the dimensions of the largest (most detailed) miplevel,  $0$ .

## 11.4. Image Layouts

Images are stored in implementation-dependent opaque layouts in memory. Each layout has limitations on what kinds of operations are supported for image subresources using the layout. At any given time, the data representing an image subresource in memory exists in a particular layout which is determined by the most recent layout transition that was performed on that image subresource. Applications have control over which layout each image subresource uses, and **can** transition an image subresource from one layout to another. Transitions **can** happen with an image memory barrier, included as part of a `vkCmdPipelineBarrier` or a `vkCmdWaitEvents` command buffer command (see [Image Memory Barriers](#)), or as part of a subpass dependency within a render pass (see [VkSubpassDependency](#)). The image layout is per-image subresource, and separate image subresources of the same image **can** be in different layouts at the same time with one exception - depth and stencil aspects of a given image subresource **must** always be in the same layout.

*Note*

Each layout **may** offer optimal performance for a specific usage of image memory. For example, an image with a layout of `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` **may** provide optimal performance for use as a color attachment, but be unsupported for use in transfer commands. Applications **can** transition an image subresource from one layout to another in order to achieve optimal performance when the image subresource is used for multiple kinds of operations. After initialization, applications need not use any layout other than the general layout, though this **may** produce suboptimal performance on some implementations.

Upon creation, all image subresources of an image are initially in the same layout, where that layout is selected by the `VkImageCreateInfo::initialLayout` member. The `initialLayout` **must** be either `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`. If it is `VK_IMAGE_LAYOUT_PREINITIALIZED`, then the image data **can** be preinitialized by the host while using this layout, and the transition away from this layout will preserve that data. If it is `VK_IMAGE_LAYOUT_UNDEFINED`, then the contents of the data are considered to be undefined, and the transition away from this layout is not guaranteed to preserve that data. For either of these initial layouts, any image subresources **must** be transitioned to another layout before they are accessed by the device.

Host access to image memory is only well-defined for [\[glossary-linear-resource\]](#) images and for image subresources of those images which are currently in either the `VK_IMAGE_LAYOUT_PREINITIALIZED` or `VK_IMAGE_LAYOUT_GENERAL` layout. Calling `vkGetImageSubresourceLayout` for a linear image returns a subresource layout mapping that is valid for either of those image layouts.

The set of image layouts consists of:

```

typedef enum VkImageLayout {
    VK_IMAGE_LAYOUT_UNDEFINED = 0,
    VK_IMAGE_LAYOUT_GENERAL = 1,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL = 4,
    VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL = 5,
    VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL = 6,
    VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL = 7,
    VK_IMAGE_LAYOUT_PREINITIALIZED = 8,
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL = 1000117000,
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL = 1000117001,
    VK_IMAGE_LAYOUT_PRESENT_SRC_KHR = 1000001002,
    VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR = 1000111000,
    VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV = 1000164003,
    VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT = 1000218000,
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR = 1000241000,
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR = 1000241001,
    VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR = 1000241002,
    VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR = 1000241003,
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL_KHR =
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL,
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL_KHR =
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL,
    VK_IMAGE_LAYOUT_MAX_ENUM = 0x7FFFFFFF
} VkImageLayout;

```

The type(s) of device access supported by each layout are:

- **VK\_IMAGE\_LAYOUT\_UNDEFINED** does not support device access. This layout **must** only be used as the `initialLayout` member of `VkImageCreateInfo` or `VkAttachmentDescription`, or as the `oldLayout` in an image transition. When transitioning out of this layout, the contents of the memory are not guaranteed to be preserved.
- **VK\_IMAGE\_LAYOUT\_PREINITIALIZED** does not support device access. This layout **must** only be used as the `initialLayout` member of `VkImageCreateInfo` or `VkAttachmentDescription`, or as the `oldLayout` in an image transition. When transitioning out of this layout, the contents of the memory are preserved. This layout is intended to be used as the initial layout for an image whose contents are written by the host, and hence the data **can** be written to memory immediately, without first executing a layout transition. Currently, **VK\_IMAGE\_LAYOUT\_PREINITIALIZED** is only useful with `linear` images because there is not a standard layout defined for **VK\_IMAGE\_TILING\_OPTIMAL** images.
- **VK\_IMAGE\_LAYOUT\_GENERAL** supports all types of device access.
- **VK\_IMAGE\_LAYOUT\_COLOR\_ATTACHMENT\_OPTIMAL** **must** only be used as a color or resolve attachment in a `VkFramebuffer`. This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` usage bit enabled.
- **VK\_IMAGE\_LAYOUT\_DEPTH\_STENCIL\_ATTACHMENT\_OPTIMAL** specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read and write access as a depth/stencil

attachment. It is equivalent to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR` and `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR`.

- `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read only access as a depth/stencil attachment or in shaders. It is equivalent to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR` and `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR`.
- `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` specifies a layout for depth/stencil format images allowing read and write access to the stencil aspect as a stencil attachment, and read only access to the depth aspect as a depth attachment or in shaders. It is equivalent to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR` and `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR`.
- `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` specifies a layout for depth/stencil format images allowing read and write access to the depth aspect as a depth attachment, and read only access to the stencil aspect as a stencil attachment or in shaders. It is equivalent to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR` and `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR`.
- `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR` specifies a layout for the depth aspect of a depth/stencil format image allowing read and write access as a depth attachment.
- `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR` specifies a layout for the depth aspect of a depth/stencil format image allowing read-only access as a depth attachment or in shaders.
- `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR` specifies a layout for the stencil aspect of a depth/stencil format image allowing read and write access as a stencil attachment.
- `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL_KHR` specifies a layout for the stencil aspect of a depth/stencil format image allowing read-only access as a stencil attachment or in shaders.
- `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` **must** only be used as a read-only image in a shader (which **can** be read as a sampled image, combined image/sampler and/or input attachment). This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` usage bit enabled.
- `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` **must** only be used as a source image of a transfer command (see the definition of `VK_PIPELINE_STAGE_TRANSFER_BIT`). This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage bit enabled.
- `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` **must** only be used as a destination image of a transfer command. This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage bit enabled.
- `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` **must** only be used for presenting a presentable image for display. A swapchain's image **must** be transitioned to this layout before calling `vkQueuePresentKHR`, and **must** be transitioned away from this layout after calling `vkAcquireNextImageKHR`.
- `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` is valid only for shared presentable images, and **must** be used for any usage the image supports.
- `VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV` **must** only be used as a read-only [shading-rate-image](#). This layout is valid only for image subresources of images created with the

`VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV` usage bit enabled.

- `VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT` **must** only be used as a fragment density map attachment in a `VkRenderPass`. This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT` usage bit enabled.

The layout of each image subresource is not a state of the image subresource itself, but is rather a property of how the data in memory is organized, and thus for each mechanism of accessing an image in the API the application **must** specify a parameter or structure member that indicates which image layout the image subresource(s) are considered to be in when the image will be accessed. For transfer commands, this is a parameter to the command (see [Clear Commands](#) and [Copy Commands](#)). For use as a framebuffer attachment, this is a member in the substructures of the `VkRenderPassCreateInfo` (see [Render Pass](#)). For use in a descriptor set, this is a member in the `VkDescriptorImageInfo` structure (see [Descriptor Set Updates](#)).

#### 11.4.1. Image Layout Matching Rules

At the time that any command buffer command accessing an image executes on any queue, the layouts of the image subresources that are accessed **must** all match exactly the layout specified via the API controlling those accesses , except in case of accesses to an image with a depth/stencil format performed through descriptors referring to only a single aspect of the image, where the following relaxed matching rules apply:

- Descriptors referring just to the depth aspect of a depth/stencil image only need to match in the image layout of the depth aspect, thus `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` and `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` are considered to match.
- Descriptors referring just to the stencil aspect of a depth/stencil image only need to match in the image layout of the stencil aspect, thus `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` and `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` are considered to match .

When performing a layout transition on an image subresource, the old layout value **must** either equal the current layout of the image subresource (at the time the transition executes), or else be `VK_IMAGE_LAYOUT_UNDEFINED` (implying that the contents of the image subresource need not be preserved). The new layout used in a transition **must** not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

The image layout of each image subresource of a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus applications **must** provide the same sample locations that were last used to render to the given image subresource whenever a layout transition of the image subresource happens, otherwise the contents of the depth aspect of the image subresource become undefined.

In addition, depth reads from a depth/stencil attachment referring to an image subresource range of a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range return undefined values.

Similarly, depth writes to a depth/stencil attachment referring to an image subresource range of a

depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range make the contents of the depth aspect of those image subresources undefined.

## 11.5. Image Views

Image objects are not directly accessed by pipeline shaders for reading or writing image data. Instead, *image views* representing contiguous ranges of the image subresources and containing additional metadata are used for that purpose. Views **must** be created on images of compatible types, and **must** represent a valid subset of image subresources.

Image views are represented by `VkImageView` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImageView)
```

The types of image views that **can** be created are:

```
typedef enum VkImageViewType {
    VK_IMAGE_VIEW_TYPE_1D = 0,
    VK_IMAGE_VIEW_TYPE_2D = 1,
    VK_IMAGE_VIEW_TYPE_3D = 2,
    VK_IMAGE_VIEW_TYPE_CUBE = 3,
    VK_IMAGE_VIEW_TYPE_1D_ARRAY = 4,
    VK_IMAGE_VIEW_TYPE_2D_ARRAY = 5,
    VK_IMAGE_VIEW_TYPE_CUBE_ARRAY = 6,
    VK_IMAGE_VIEW_TYPE_MAX_ENUM = 0x7FFFFFFF
} VkImageViewType;
```

The exact image view type is partially implicit, based on the image's type and sample count, as well as the view creation parameters as described in the [image view compatibility table](#) for `vkCreateImageView`. This table also shows which SPIR-V `OpTypeImage` `Dim` and `Arrayed` parameters correspond to each image view type.

To create an image view, call:

```
VkResult vkCreateImageView(
    VkDevice                                     device,
    const VkImageViewCreateInfo*                 pCreateInfo,
    const VkAllocationCallbacks*                pAllocator,
    VkImageView*                                pView);
```

- `device` is the logical device that creates the image view.
- `pCreateInfo` is a pointer to a `VkImageViewCreateInfo` structure containing parameters to be used to create the image view.

- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pView` is a pointer to a `VkImageView` handle in which the resulting image view object is returned.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkImageViewCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pView` **must** be a valid pointer to a `VkImageView` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkImageViewCreateInfo` structure is defined as:

```
typedef struct VkImageViewCreateInfo {
    VkStructureType          sType;
    const void*               pNext;
    VkImageViewCreateFlags    flags;
    VkImage                  image;
    VkImageViewType           viewType;
    VkFormat                 format;
    VkComponentMapping        components;
    VkImageSubresourceRange   subresourceRange;
} VkImageViewCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is a bitmask of `VkImageViewCreateFlagBits` describing additional parameters of the image view.
- `image` is a `VkImage` on which the view will be created.
- `viewType` is a `VkImageViewType` value specifying the type of the image view.
- `format` is a `VkFormat` describing the format and type used to interpret texel blocks in the image.
- `components` is a `VkComponentMapping` specifies a remapping of color components (or of depth

or stencil components after they have been converted into color components).

- `subresourceRange` is a `VkImageSubresourceRange` selecting the set of mipmap levels and array layers to be accessible to the view.

Some of the `image` creation parameters are inherited by the view. In particular, image view creation inherits the implicit parameter `usage` specifying the allowed usages of the image view that, by default, takes the value of the corresponding `usage` parameter specified in `VkImageCreateInfo` at image creation time. If the image was has a depth-stencil format and was created with an instance of `VkImageStencilUsageCreateInfoEXT` in the `pNext` chain of `VkImageCreateInfo`, the usage is calculated based on the `subresource.aspectMask` provided:

- If `aspectMask` includes only `VK_IMAGE_ASPECT_STENCIL_BIT`, the implicit `usage` is equal to `VkImageStencilUsageCreateInfoEXT::stencilUsage`.
- If `aspectMask` includes only `VK_IMAGE_ASPECT_DEPTH_BIT`, the implicit `usage` is equal to `VkImageCreateInfo::usage`.
- If both aspects are included in `aspectMask`, the implicit `usage` is equal to the intersection of `VkImageCreateInfo::usage` and `VkImageStencilUsageCreateInfoEXT::stencilUsage`. The implicit `usage` can be overridden by including an instance of `VkImageViewUsageCreateInfo` structure in the `pNext` chain.

If `image` was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, and if the `format` of the image is not `multi-planar`, `format` can be different from the image's format, but if `image` was created without the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag and they are not equal they **must** be *compatible*. Image format compatibility is defined in the [Format Compatibility Classes](#) section. Views of compatible formats will have the same mapping between texel coordinates and memory locations irrespective of the `format`, with only the interpretation of the bit pattern changing.

**Note**

Values intended to be used with one view format **may** not be exactly preserved when written or read through a different format. For example, an integer value that happens to have the bit pattern of a floating point denorm or NaN **may** be flushed or canonicalized when written or read through a view with a floating point format. Similarly, a value written through a signed normalized format that has a bit pattern exactly equal to  $-2^b$  **may** be changed to  $-2^b + 1$  as described in [Conversion from Normalized Fixed-Point to Floating-Point](#).

If `image` was created with the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag, `format` **must** be *compatible* with the image's format as described above, or **must** be an uncompressed format in which case it **must** be *size-compatible* with the image's format, as defined for [copying data between images](#). In this case the resulting image view's texel dimensions equal the dimensions of the selected mip level divided by the compressed texel block size and rounded up.

If the image view is to be used with a sampler which supports `sampler Y'CBCR` conversion, an identically defined object of type `VkSamplerYcbcrConversion` to that used to create the sampler **must** be passed to `vkCreateImageView` in a `VkSamplerYcbcrConversionInfo` added to the `pNext` chain of `VkImageViewCreateInfo`. Conversely, if a `VkSamplerYcbcrConversion` object is passed to `vkCreateImageView`, an identically defined `VkSamplerYcbcrConversion` object **must** be used when

sampling the image.

If the image has a multi-planar format and `subresourceRange.aspectMask` is `VK_IMAGE_ASPECT_COLOR_BIT`, `format` must be identical to the image `format`, and the sampler to be used with the image view must enable sampler Y'CbCr conversion.

If `image` was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` and the image has a multi-planar format, and if `subresourceRange.aspectMask` is `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`, `format` must be compatible with the corresponding plane of the image, and the sampler to be used with the image view must not enable sampler Y'CbCr conversion. The `width` and `height` of the single-plane image view must be derived from the multi-planar image's dimensions in the manner listed for `plane compatibility` for the plane.

Any view of an image plane will have the same mapping between texel coordinates and memory locations as used by the channels of the color aspect, subject to the formulae relating texel coordinates to lower-resolution planes as described in [Chroma Reconstruction](#). That is, if an R or B plane has a reduced resolution relative to the G plane of the multi-planar image, the image view operates using the  $(u_{\text{plane}}, v_{\text{plane}})$  unnormalized coordinates of the reduced-resolution plane, and these coordinates access the same memory locations as the  $(u_{\text{color}}, v_{\text{color}})$  unnormalized coordinates of the color aspect for which chroma reconstruction operations operate on the same  $(u_{\text{plane}}, v_{\text{plane}})$  or  $(i_{\text{plane}}, j_{\text{plane}})$  coordinates.

*Table 15. Image and image view parameter compatibility requirements*

## Valid Usage

- If `image` was not created with `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT` then `viewType` **must** not be `VK_IMAGE_VIEW_TYPE_CUBE` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`
- If the `image` `cubemap arrays` feature is not enabled, `viewType` **must** not be `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`
- If `image` was created with `VK_IMAGE_TYPE_3D` but without `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set then `viewType` **must** not be `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`
- `image` **must** have been created with a `usage` value containing at least one of `VK_IMAGE_USAGE_SAMPLED_BIT`, `VK_IMAGE_USAGE_STORAGE_BIT`, `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV`, or `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`
- The `format features` of the resultant image view **must** contain at least one bit.
- If `usage` contains `VK_IMAGE_USAGE_SAMPLED_BIT`, then the `format features` of the resultant image view **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`.
- If `usage` contains `VK_IMAGE_USAGE_STORAGE_BIT`, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT`.
- If `usage` contains `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`.
- If `usage` contains `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, then the image view's `format features` **must** contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.
- If `usage` contains `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, then the image view's `format features` **must** contain at least one of `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.
- `subresourceRange.baseMipLevel` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` **must** be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- If `image` was created with `usage` containing `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`, `subresourceRange.levelCount` **must** be 1
- If `image` is not a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, or `viewType` is not `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, `subresourceRange::baseArrayLayer` **must** be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- If `subresourceRange::layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `image` is not a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, or `viewType` is not `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, `subresourceRange::layerCount` **must** be non-zero and `subresourceRange::baseArrayLayer + subresourceRange::layerCount` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was

created

- If `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, and `viewType` is `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, `subresourceRange::baseArrayLayer` **must** be less than the depth computed from `baseMipLevel` and `extent.depth` specified in `VkImageCreateInfo` when `image` was created, according to the formula defined in [Image Miplevel Sizing](#).
- If `subresourceRange::layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, and `viewType` is `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, `subresourceRange::layerCount` **must** be non-zero and `subresourceRange::baseArrayLayer + subresourceRange::layerCount` **must** be less than or equal to the depth computed from `baseMipLevel` and `extent.depth` specified in `VkImageCreateInfo` when `image` was created, according to the formula defined in [Image Miplevel Sizing](#).
- If `image` was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, `format` **must** be compatible with the `format` used to create `image`, as defined in [Format Compatibility Classes](#)
- If `image` was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, but without the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag, and if the `format` of the `image` is not a `multi-planar` format, `format` **must** be compatible with the `format` used to create `image`, as defined in [Format Compatibility Classes](#)
- If `image` was created with the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag, `format` **must** be compatible with, or **must** be an uncompressed format that is size-compatible with, the `format` used to create `image`.
- If `image` was created with the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag, the `levelCount` and `layerCount` members of `subresourceRange` **must** both be 1.
- If a `VkImageFormatListCreateInfoKHR` structure was included in the `pNext` chain of the `VkImageCreateInfo` structure used when creating `image` and the `viewFormatCount` field of `VkImageFormatListCreateInfoKHR` is not zero then `format` **must** be one of the formats in `VkImageFormatListCreateInfoKHR::pViewFormats`.
- If `image` was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, if the `format` of the `image` is a `multi-planar` format, and if `subresourceRange.aspectMask` is one of `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`, then `format` **must** be compatible with the `VkFormat` for the plane of the `image` format indicated by `subresourceRange.aspectMask`, as defined in [Compatible formats of planes of multi-planar formats](#)
- If `image` was not created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, or if the `format` of the `image` is a `multi-planar` format and if `subresourceRange.aspectMask` is `VK_IMAGE_ASPECT_COLOR_BIT`, `format` **must** be identical to the `format` used to create `image`
- If the `pNext` chain contains an instance of `VkSamplerYcbcrConversionInfo` with a `conversion` value other than `VK_NULL_HANDLE`, all members of `components` **must** have the value `VK_COMPONENT_SWIZZLE_IDENTITY`.
- If `image` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- `subresourceRange` and `viewType` **must** be compatible with the image, as described in the compatibility table
- If `image` has an `external format`, `format` **must** be `VK_FORMAT_UNDEFINED`.
- If `image` has an `external format`, the `pNext` chain **must** contain an instance of `VkSamplerYcbcrConversionInfo` with a `conversion` object created with the same external format as `image`.
- If `image` has an `external format`, all members of `components` **must** be `VK_COMPONENT_SWIZZLE_IDENTITY`.
- If `image` was created with `usage` containing `VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV`, `viewType` **must** be `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`
- If `image` was created with `usage` containing `VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV`, `format` **must** be `VK_FORMAT_R8_UINT`
- If `dynamic fragment density map` feature is not enabled, `flags` **must** not contain `VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT`
- If `dynamic fragment density map` feature is not enabled and `image` was created with `usage` containing `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`, `flags` **must** not contain any of `VK_IMAGE_CREATE_PROTECTED_BIT`, `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT`
- If the `pNext` chain includes an instance of `VkImageViewUsageCreateInfo`, and `image` was not created with an instance of `VkImageStencilUsageCreateInfoEXT` in the `pNext` chain of `VkImageCreateInfo`, its `usage` member **must** not include any bits that were not set in the `usage` member of the `VkImageCreateInfo` structure used to create `image`
- If the `pNext` chain includes an instance of `VkImageViewUsageCreateInfo`, `image` was created with an instance of `VkImageStencilUsageCreateInfoEXT` in the `pNext` chain of `VkImageCreateInfo`, and `subResourceRange.aspectMask` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, the `usage` member of the `VkImageViewUsageCreateInfo` instance **must** not include any bits that were not set in the `usage` member of the `VkImageStencilUsageCreateInfoEXT` structure used to create `image`
- If the `pNext` chain includes an instance of `VkImageViewUsageCreateInfo`, `image` was created with an instance of `VkImageStencilUsageCreateInfoEXT` in the `pNext` chain of `VkImageCreateInfo`, and `subResourceRange.aspectMask` includes bits other than `VK_IMAGE_ASPECT_STENCIL_BIT`, the `usage` member of the `VkImageViewUsageCreateInfo` instance **must** not include any bits that were not set in the `usage` member of the `VkImageCreateInfo` structure used to create `image`

## Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO`
- Each **pNext** member of any structure (including this one) in the **pNext** chain must be either `NULL` or a pointer to a valid instance of `VkImageViewASTCDecodeModeEXT`, `VkImageViewUsageCreateInfo`, or `VkSamplerYcbcrConversionInfo`
- Each **sType** member in the **pNext** chain must be unique
- **flags** must be a valid combination of `VkImageViewCreateFlagBits` values
- **image** must be a valid `VkImage` handle
- **viewType** must be a valid `VkImageViewType` value
- **format** must be a valid `VkFormat` value
- **components** must be a valid `VkComponentMapping` structure
- **subresourceRange** must be a valid `VkImageSubresourceRange` structure

Bits which can be set in `VkImageViewCreateInfo::flags`, specifying additional parameters of an image, are:

```
typedef enum VkImageViewCreateFlagBits {
    VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT = 0x00000001,
    VK_IMAGE_VIEW_CREATE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkImageViewCreateFlagBits;
```

- `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT` prohibits the implementation from accessing the fragment density map by the host during `vkCmdBeginRenderPass` as the contents are expected to change after recording

```
typedef VkFlags VkImageViewCreateFlags;
```

`VkImageViewCreateFlags` is a bitmask type for setting a mask of zero or more `VkImageViewCreateFlagBits`.

The set of usages for the created image view can be restricted compared to the parent image's **usage** flags by chaining a `VkImageViewUsageCreateInfo` structure through the **pNext** member to `VkImageViewCreateInfo`.

The `VkImageViewUsageCreateInfo` structure is defined as:

```
typedef struct VkImageViewUsageCreateInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkImageUsageFlags    usage;
} VkImageViewUsageCreateInfo;
```

or the equivalent

```
typedef VkImageViewUsageCreateInfo VkImageViewUsageCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `usage` is a bitmask describing the allowed usages of the image view. See [VkImageUsageFlagBits](#) for a description of the supported bits.

When this structure is chained to [VkImageViewCreateInfo](#) the `usage` field overrides the implicit `usage` parameter inherited from image creation time and its value is used instead for the purposes of determining the valid usage conditions of [VkImageViewCreateInfo](#).

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_VIEW_USAGE_CREATE_INFO`
- `usage` **must** be a valid combination of [VkImageUsageFlagBits](#) values
- `usage` **must** not be `0`

The [VkImageSubresourceRange](#) structure is defined as:

```
typedef struct VkImageSubresourceRange {  
    VkImageAspectFlags    aspectMask;  
    uint32_t              baseMipLevel;  
    uint32_t              levelCount;  
    uint32_t              baseArrayLayer;  
    uint32_t              layerCount;  
} VkImageSubresourceRange;
```

- `aspectMask` is a bitmask of [VkImageAspectFlagBits](#) specifying which aspect(s) of the image are included in the view.
- `baseMipLevel` is the first mipmap level accessible to the view.
- `levelCount` is the number of mipmap levels (starting from `baseMipLevel`) accessible to the view.
- `baseArrayLayer` is the first array layer accessible to the view.
- `layerCount` is the number of array layers (starting from `baseArrayLayer`) accessible to the view.

The number of mipmap levels and array layers **must** be a subset of the image subresources in the image. If an application wants to use all mip levels or layers in an image after the `baseMipLevel` or `baseArrayLayer`, it **can** set `levelCount` and `layerCount` to the special values `VK_REMAINING_MIP_LEVELS` and `VK_REMAINING_ARRAY_LAYERS` without knowing the exact number of mip levels or layers.

For cube and cube array image views, the layers of the image view starting at `baseArrayLayer` correspond to faces in the order `+X, -X, +Y, -Y, +Z, -Z`. For cube arrays, each set of six sequential

layers is a single cube, so the number of cube maps in a cube map array view is `layerCount` / 6, and image array layer (`baseArrayLayer` + i) is face index (i mod 6) of cube  $i / 6$ . If the number of layers in the view, whether set explicitly in `layerCount` or implied by `VK_REMAINING_ARRAY_LAYERS`, is not a multiple of 6, the last cube map in the array **must** not be accessed.

`aspectMask` **must** be only `VK_IMAGE_ASPECT_COLOR_BIT`, `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` if `format` is a color, depth-only or stencil-only format, respectively, except if `format` is a multi-planar format. If using a depth/stencil format with both depth and stencil components, `aspectMask` **must** include at least one of `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`, and **can** include both.

When the `VkImageSubresourceRange` structure is used to select a subset of the slices of a 3D image's mip level in order to create a 2D or 2D array image view of a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT`, `baseArrayLayer` and `layerCount` specify the first slice index and the number of slices to include in the created image view. Such an image view **can** be used as a framebuffer attachment that refers only to the specified range of slices of the selected mip level. However, any layout transitions performed on such an attachment view during a render pass instance still apply to the entire subresource referenced which includes all the slices of the selected mip level.

When using an image view of a depth/stencil image to populate a descriptor set (e.g. for sampling in the shader, or for use as an input attachment), the `aspectMask` **must** only include one bit and selects whether the image view is used for depth reads (i.e. using a floating-point sampler or input attachment in the shader) or stencil reads (i.e. using an unsigned integer sampler or input attachment in the shader). When an image view of a depth/stencil image is used as a depth/stencil framebuffer attachment, the `aspectMask` is ignored and both depth and stencil image subresources are used.

The `VkComponentMapping` `components` member describes a remapping from components of the image to components of the vector returned by shader image instructions. This remapping **must** be identity for storage image descriptors, input attachment descriptors, framebuffer attachments, and any `VkImageView` used with a combined image sampler that enables `sampler Y'CBCR` conversion.

When creating a `VkImageView`, if `sampler Y'CBCR` conversion is enabled in the sampler, the `aspectMask` of a `subresourceRange` used by the `VkImageView` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`.

When creating a `VkImageView`, if `sampler Y'CBCR` conversion is not enabled in the sampler and the image `format` is multi-planar, the image **must** have been created with `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, and the `aspectMask` of the `VkImageView`'s `subresourceRange` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`.

## Valid Usage

- If `levelCount` is not `VK_REMAINING_MIP_LEVELS`, it **must** be greater than `0`
- If `layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, it **must** be greater than `0`
- If `aspectMask` includes `VK_IMAGE_ASPECT_COLOR_BIT`, then it **must** not include any of `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`
- `aspectMask` **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index `i`

## Valid Usage (Implicit)

- `aspectMask` **must** be a valid combination of `VkImageAspectFlagBits` values
- `aspectMask` **must** not be `0`

Bits which **can** be set in an aspect mask to specify aspects of an image for purposes such as identifying a subresource, are:

```
typedef enum VkImageAspectFlagBits {
    VK_IMAGE_ASPECT_COLOR_BIT = 0x00000001,
    VK_IMAGE_ASPECT_DEPTH_BIT = 0x00000002,
    VK_IMAGE_ASPECT_STENCIL_BIT = 0x00000004,
    VK_IMAGE_ASPECT_METADATA_BIT = 0x00000008,
    VK_IMAGE_ASPECT_PLANE_0_BIT = 0x00000010,
    VK_IMAGE_ASPECT_PLANE_1_BIT = 0x00000020,
    VK_IMAGE_ASPECT_PLANE_2_BIT = 0x00000040,
    VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT = 0x00000080,
    VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT = 0x00000100,
    VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT = 0x00000200,
    VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT = 0x00000400,
    VK_IMAGE_ASPECT_PLANE_0_BIT_KHR = VK_IMAGE_ASPECT_PLANE_0_BIT,
    VK_IMAGE_ASPECT_PLANE_1_BIT_KHR = VK_IMAGE_ASPECT_PLANE_1_BIT,
    VK_IMAGE_ASPECT_PLANE_2_BIT_KHR = VK_IMAGE_ASPECT_PLANE_2_BIT,
    VK_IMAGE_ASPECT_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkImageAspectFlagBits;
```

- `VK_IMAGE_ASPECT_COLOR_BIT` specifies the color aspect.
- `VK_IMAGE_ASPECT_DEPTH_BIT` specifies the depth aspect.
- `VK_IMAGE_ASPECT_STENCIL_BIT` specifies the stencil aspect.
- `VK_IMAGE_ASPECT_METADATA_BIT` specifies the metadata aspect, used for sparse `sparse resource` operations.
- `VK_IMAGE_ASPECT_PLANE_0_BIT` specifies plane 0 of a *multi-planar* image format.
- `VK_IMAGE_ASPECT_PLANE_1_BIT` specifies plane 1 of a *multi-planar* image format.
- `VK_IMAGE_ASPECT_PLANE_2_BIT` specifies plane 2 of a *multi-planar* image format.

- `VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT` specifies *memory plane* 0.
- `VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT` specifies *memory plane* 1.
- `VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT` specifies *memory plane* 2.
- `VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT` specifies *memory plane* 3.

```
typedef VkFlags VkImageAspectFlags;
```

`VkImageAspectFlags` is a bitmask type for setting a mask of zero or more `VkImageAspectFlagBits`.

The `VkComponentMapping` structure is defined as:

```
typedef struct VkComponentMapping {
    VkComponentSwizzle r;
    VkComponentSwizzle g;
    VkComponentSwizzle b;
    VkComponentSwizzle a;
} VkComponentMapping;
```

- `r` is a `VkComponentSwizzle` specifying the component value placed in the R component of the output vector.
- `g` is a `VkComponentSwizzle` specifying the component value placed in the G component of the output vector.
- `b` is a `VkComponentSwizzle` specifying the component value placed in the B component of the output vector.
- `a` is a `VkComponentSwizzle` specifying the component value placed in the A component of the output vector.

### Valid Usage (Implicit)

- `r` **must** be a valid `VkComponentSwizzle` value
- `g` **must** be a valid `VkComponentSwizzle` value
- `b` **must** be a valid `VkComponentSwizzle` value
- `a` **must** be a valid `VkComponentSwizzle` value

Possible values of the members of `VkComponentMapping`, specifying the component values placed in each component of the output vector, are:

```

typedef enum VkComponentSwizzle {
    VK_COMPONENT_SWIZZLE_IDENTITY = 0,
    VK_COMPONENT_SWIZZLE_ZERO = 1,
    VK_COMPONENT_SWIZZLE_ONE = 2,
    VK_COMPONENT_SWIZZLE_R = 3,
    VK_COMPONENT_SWIZZLE_G = 4,
    VK_COMPONENT_SWIZZLE_B = 5,
    VK_COMPONENT_SWIZZLE_A = 6,
    VK_COMPONENT_SWIZZLE_MAX_ENUM = 0x7FFFFFFF
} VkComponentSwizzle;

```

- **VK\_COMPONENT\_SWIZZLE\_IDENTITY** specifies that the component is set to the identity swizzle.
- **VK\_COMPONENT\_SWIZZLE\_ZERO** specifies that the component is set to zero.
- **VK\_COMPONENT\_SWIZZLE\_ONE** specifies that the component is set to either 1 or 1.0, depending on whether the type of the image view format is integer or floating-point respectively, as determined by the [Format Definition](#) section for each [VkFormat](#).
- **VK\_COMPONENT\_SWIZZLE\_R** specifies that the component is set to the value of the R component of the image.
- **VK\_COMPONENT\_SWIZZLE\_G** specifies that the component is set to the value of the G component of the image.
- **VK\_COMPONENT\_SWIZZLE\_B** specifies that the component is set to the value of the B component of the image.
- **VK\_COMPONENT\_SWIZZLE\_A** specifies that the component is set to the value of the A component of the image.

Setting the identity swizzle on a component is equivalent to setting the identity mapping on that component. That is:

*Table 16. Component Mappings Equivalent To VK\_COMPONENT\_SWIZZLE\_IDENTITY*

Component	Identity Mapping
components.r	VK_COMPONENT_SWIZZLE_R
components.g	VK_COMPONENT_SWIZZLE_G
components.b	VK_COMPONENT_SWIZZLE_B
components.a	VK_COMPONENT_SWIZZLE_A

If the **pNext** list includes a [VkImageViewASTCDecodeModeEXT](#) structure, then that structure includes a parameter specifying the decode mode for image views using ASTC compressed formats.

The [VkImageViewASTCDecodeModeEXT](#) structure is defined as:

```

typedef struct VkImageViewASTCDecodeModeEXT {
    VkStructureType      sType;
    const void*        pNext;
    VkFormat            decodeMode;
} VkImageViewASTCDecodeModeEXT;

```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `decodeMode` is the intermediate format used to decode ASTC compressed formats.

## Valid Usage

- `decodeMode` **must** be one of `VK_FORMAT_R16G16B16A16_SFLOAT`, `VK_FORMAT_R8G8B8A8_UNORM`, or `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`
- If the `decodeModeSharedExponent` feature is not enabled, `decodeMode` **must** not be `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`
- If `decodeMode` is `VK_FORMAT_R8G8B8A8_UNORM` the image view **must** not include blocks using any of the ASTC HDR modes
- `format` of the image view **must** be one of `VK_FORMAT_ASTC_4x4_UNORM_BLOCK`, `VK_FORMAT_ASTC_4x4_SRGB_BLOCK`, `VK_FORMAT_ASTC_5x4_SRGB_BLOCK`, `VK_FORMAT_ASTC_5x5_SRGB_BLOCK`, `VK_FORMAT_ASTC_6x5_SRGB_BLOCK`, `VK_FORMAT_ASTC_6x6_SRGB_BLOCK`, `VK_FORMAT_ASTC_8x5_SRGB_BLOCK`, `VK_FORMAT_ASTC_8x6_SRGB_BLOCK`, `VK_FORMAT_ASTC_8x8_SRGB_BLOCK`, `VK_FORMAT_ASTC_10x5_SRGB_BLOCK`, `VK_FORMAT_ASTC_10x6_SRGB_BLOCK`, `VK_FORMAT_ASTC_10x8_SRGB_BLOCK`, `VK_FORMAT_ASTC_10x10_SRGB_BLOCK`, `VK_FORMAT_ASTC_12x10_SRGB_BLOCK`, `VK_FORMAT_ASTC_12x12_SRGB_BLOCK`, `VK_FORMAT_ASTC_4x4_UNORM_BLOCK`, `VK_FORMAT_ASTC_5x4_UNORM_BLOCK`, `VK_FORMAT_ASTC_5x5_UNORM_BLOCK`, `VK_FORMAT_ASTC_6x5_UNORM_BLOCK`, `VK_FORMAT_ASTC_6x6_UNORM_BLOCK`, `VK_FORMAT_ASTC_8x5_UNORM_BLOCK`, `VK_FORMAT_ASTC_8x6_UNORM_BLOCK`, `VK_FORMAT_ASTC_8x8_UNORM_BLOCK`, `VK_FORMAT_ASTC_10x5_UNORM_BLOCK`, `VK_FORMAT_ASTC_10x6_UNORM_BLOCK`, `VK_FORMAT_ASTC_10x8_UNORM_BLOCK`, `VK_FORMAT_ASTC_10x10_UNORM_BLOCK`, `VK_FORMAT_ASTC_12x10_UNORM_BLOCK`, `VK_FORMAT_ASTC_12x12_UNORM_BLOCK`, or

If `format` uses sRGB encoding then the `decodeMode` has no effect.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT`
- `decodeMode` **must** be a valid `VkFormat` value

To destroy an image view, call:

```
void vkDestroyImageView(  
    VkDevice device,  
    VkImageView imageView,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the image view.
- `imageView` is the image view to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- All submitted commands that refer to `imageView` **must** have completed execution
- If `VkAllocationCallbacks` were provided when `imageView` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `imageView` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `imageView` is not `VK_NULL_HANDLE`, `imageView` **must** be a valid `VkImageView` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `imageView` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `imageView` **must** be externally synchronized

To get the handle for an image view, call:

```
uint32_t vkGetImageViewHandleNVX(  
    VkDevice device,  
    const VkImageViewHandleInfoNVX* pInfo);
```

- `device` is the logical device that owns the image view.
- `pInfo` describes the image view to query and type of handle.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pInfo` **must** be a valid pointer to a valid `VkImageViewHandleInfoNVX` structure

The `VkImageViewHandleInfoNVX` structure is defined as:

```
typedef struct VkImageViewHandleInfoNVX {
    VkStructureType    sType;
    const void*        pNext;
    VkImageView        imageView;
    VkDescriptorType   descriptorType;
    VkSampler          sampler;
} VkImageViewHandleInfoNVX;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `imageView` is the image view to query.
- `descriptorType` is the type of descriptor for which to query a handle.
- `sampler` is the sampler to combine with the image view when generating the handle.

## Valid Usage

- `descriptorType` **must** be `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`
- `sampler` **must** be a valid `VkSampler` if `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, the image that `imageView` was created from **must** have been created with the `VK_IMAGE_USAGE_SAMPLED_BIT` usage bit set
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, the image that `imageView` was created from **must** have been created with the `VK_IMAGE_USAGE_STORAGE_BIT` usage bit set

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_VIEW_HANDLE_INFO_NVX`
- `pNext` **must** be `NULL`
- `imageView` **must** be a valid `VkImageView` handle
- `descriptorType` **must** be a valid `VkDescriptorType` value
- If `sampler` is not `VK_NULL_HANDLE`, `sampler` **must** be a valid `VkSampler` handle
- Both of `imageView`, and `sampler` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

### 11.5.1. Image View Format Features

Valid usage of a `VkImageView` **may** be constrained by the image view's format features, defined below. Such constraints are documented in the affected valid usage statement.

- If the view's image was created with `VK_IMAGE_TILING_LINEAR`, then the image view's set of *format features* is the value of `VkFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same `format` as `VkImageViewCreateInfo::format`.
- If the view's image was created with `VK_IMAGE_TILING_OPTIMAL`, but without an `external format`, then the image view's set of *format features* is the value of `VkFormatProperties::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same `format` as `VkImageViewCreateInfo::format`.
- If the view's image was created with an `external format`, then the image views's set of *format features* is the value of `VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures` found by calling `vkGetAndroidHardwareBufferPropertiesANDROID` on the Android hardware buffer that was imported to the `VkDeviceMemory` to which the image is bound.
- If the view's image was created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then:
  - The image's DRM format modifier is the value of `VkImageDrmFormatModifierListCreateInfoEXT::drmFormatModifier` found by calling `vkGetImageDrmFormatModifierPropertiesEXT`.
  - Let `VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties` be the array found by calling `vkGetPhysicalDeviceFormatProperties2` on the same `format` as `VkImageViewCreateInfo::format`.
  - Let `VkDrmFormatModifierPropertiesEXT prop` be the array element whose `drmFormatModifier` member is the value of the image's DRM format modifier.
  - Then the image view's set of *format features* is the value of `prop::drmFormatModifierTilingFeatures`.

## 11.6. Resource Memory Association

Resources are initially created as *virtual allocations* with no backing memory. Device memory is allocated separately (see [Device Memory](#)) and then associated with the resource. This association is

done differently for sparse and non-sparse resources.

Resources created with any of the sparse creation flags are considered sparse resources. Resources created without these flags are non-sparse. The details on resource memory association for sparse resources is described in [Sparse Resources](#).

Non-sparse resources **must** be bound completely and contiguously to a single `VkDeviceMemory` object before the resource is passed as a parameter to any of the following operations:

- creating image or buffer views
- updating descriptor sets
- recording commands in a command buffer

Once bound, the memory binding is immutable for the lifetime of the resource.

In a logical device representing more than one physical device, buffer and image resources exist on all physical devices but **can** be bound to memory differently on each. Each such replicated resource is an *instance* of the resource. For sparse resources, each instance **can** be bound to memory arbitrarily differently. For non-sparse resources, each instance **can** either be bound to the local or a peer instance of the memory, or for images **can** be bound to rectangular regions from the local and/or peer instances. When a resource is used in a descriptor set, each physical device interprets the descriptor according to its own instance's binding to memory.

*Note*

There are no new copy commands to transfer data between physical devices. Instead, an application **can** create a resource with a peer mapping and use it as the source or destination of a transfer command executed by a single physical device to copy the data from one physical device to another.

To determine the memory requirements for a buffer resource, call:

```
void vkGetBufferMemoryRequirements(  
    VkDevice device,  
    VkBuffer buffer,  
    VkMemoryRequirements* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `buffer` is the buffer to query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements` structure in which the memory requirements of the buffer object are returned.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `buffer` **must** be a valid `VkBuffer` handle
- `pMemoryRequirements` **must** be a valid pointer to a `VkMemoryRequirements` structure
- `buffer` **must** have been created, allocated, or retrieved from `device`

To determine the memory requirements for an image resource which is not created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag set, call:

```
void vkGetImageMemoryRequirements(  
    VkDevice device,  
    VkImage image,  
    VkMemoryRequirements* pMemoryRequirements);
```

- `device` is the logical device that owns the image.
- `image` is the image to query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements` structure in which the memory requirements of the image object are returned.

## Valid Usage

- `image` **must** not have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag set

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `image` **must** be a valid `VkImage` handle
- `pMemoryRequirements` **must** be a valid pointer to a `VkMemoryRequirements` structure
- `image` **must** have been created, allocated, or retrieved from `device`

The `VkMemoryRequirements` structure is defined as:

```
typedef struct VkMemoryRequirements {  
    VkDeviceSize size;  
    VkDeviceSize alignment;  
    uint32_t memoryTypeBits;  
} VkMemoryRequirements;
```

- `size` is the size, in bytes, of the memory allocation **required** for the resource.

- `alignment` is the alignment, in bytes, of the offset within the allocation **required** for the resource.
- `memoryTypeBits` is a bitmask and contains one bit set for every supported memory type for the resource. Bit `i` is set if and only if the memory type `i` in the `VkPhysicalDeviceMemoryProperties` structure for the physical device is supported for the resource.

The precise size of images that will be bound to external Android hardware buffer memory is unknown until the memory has been imported or allocated, so applications **must** not call `vkGetImageMemoryRequirements` with such an image before it has been bound to memory. When importing Android hardware buffer memory, the `allocationSize` **can** be determined by calling `vkGetAndroidHardwareBufferPropertiesANDROID`. When allocating new memory for an image that **can** be exported to an Android hardware buffer, the memory's `allocationSize` **must** be zero; the actual size will be determined by the dedicated image's parameters. After the memory has been allocated, the amount of space allocated from the memory's heap **can** be obtained by getting the image's memory requirements or by calling `vkGetAndroidHardwareBufferPropertiesANDROID` with the Android hardware buffer exported from the memory.

The implementation guarantees certain properties about the memory requirements returned by `vkGetBufferMemoryRequirements` and `vkGetImageMemoryRequirements`:

- The `memoryTypeBits` member always contains at least one bit set.
- If `buffer` is a `VkBuffer` not created with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bit set, or if `image` is `linear` image, then the `memoryTypeBits` member always contains at least one bit set corresponding to a `VkMemoryType` with a `propertyFlags` that has both the `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` bit and the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` bit set. In other words, mappable coherent memory **can** always be attached to these objects.
- If `buffer` was created with `VkExternalMemoryBufferCreateInfo::handleTypes` set to `0` or `image` was created with `VkExternalMemoryImageCreateInfo::handleTypes` set to `0`, the `memoryTypeBits` member always contains at least one bit set corresponding to a `VkMemoryType` with a `propertyFlags` that has the `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` bit set.
- The `memoryTypeBits` member is identical for all `VkBuffer` objects created with the same value for the `flags` and `usage` members in the `VkBufferCreateInfo` structure and the `handleTypes` member of the `VkExternalMemoryBufferCreateInfo` structure passed to `vkCreateBuffer`. Further, if `usage1` and `usage2` of type `VkBufferUsageFlags` are such that the bits set in `usage2` are a subset of the bits set in `usage1`, and they have the same `flags` and `VkExternalMemoryBufferCreateInfo::handleTypes`, then the bits set in `memoryTypeBits` returned for `usage1` **must** be a subset of the bits set in `memoryTypeBits` returned for `usage2`, for all values of `flags`.
- The `alignment` member is a power of two.
- The `alignment` member is identical for all `VkBuffer` objects created with the same combination of values for the `usage` and `flags` members in the `VkBufferCreateInfo` structure passed to `vkCreateBuffer`.
- The `alignment` member satisfies the buffer descriptor offset alignment requirements associated with the `VkBuffer`'s `usage`:
  - If `usage` included `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT` or `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`, `alignment` **must** be an integer multiple of

`VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`.

- If `usage` included `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT`, `alignment` **must** be an integer multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`.
- If `usage` included `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT`, `alignment` **must** be an integer multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`.
- For images created with a color format, the `memoryTypeBits` member is identical for all `VkImage` objects created with the same combination of values for the `tiling` member, the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` bit of the `flags` member, the `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` bit of the `flags` member, `handleTypes` member of `VkExternalMemoryImageCreateInfo`, and the `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` of the `usage` member in the `VkImageCreateInfo` structure passed to `vkCreateImage`.
- For images created with a depth/stencil format, the `memoryTypeBits` member is identical for all `VkImage` objects created with the same combination of values for the `format` member, the `tiling` member, the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` bit of the `flags` member, the `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` bit of the `flags` member, `handleTypes` member of `VkExternalMemoryImageCreateInfo`, and the `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` of the `usage` member in the `VkImageCreateInfo` structure passed to `vkCreateImage`.
- If the memory requirements are for a `VkImage`, the `memoryTypeBits` member **must** not refer to a `VkMemoryType` with a `propertyFlags` that has the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set if the `image` did not have `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` bit set in the `usage` member of the `VkImageCreateInfo` structure passed to `vkCreateImage`.
- If the memory requirements are for a `VkBuffer`, the `memoryTypeBits` member **must** not refer to a `VkMemoryType` with a `propertyFlags` that has the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set.

*Note*

The implication of this requirement is that lazily allocated memory is disallowed for buffers in all cases.

- The `size` member is identical for all `VkBuffer` objects created with the same combination of creation parameters specified in `VkBufferCreateInfo` and its `pNext` chain.
- The `size` member is identical for all `VkImage` objects created with the same combination of creation parameters specified in `VkImageCreateInfo` and its `pNext` chain.

*Note*

This, however, does not imply that they interpret the contents of the bound memory identically with each other. That additional guarantee, however, **can** be explicitly requested using `VK_IMAGE_CREATE_ALIAS_BIT`.

To determine the memory requirements for a buffer resource, call:

```
void vkGetBufferMemoryRequirements2(
    VkDevice device,
    const VkBufferMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```
void vkGetBufferMemoryRequirements2KHR(
    VkDevice device,
    const VkBufferMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- **device** is the logical device that owns the buffer.
- **pInfo** is a pointer to a `VkBufferMemoryRequirementsInfo2` structure containing parameters required for the memory requirements query.
- **pMemoryRequirements** is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

### Valid Usage (Implicit)

- **device** **must** be a valid `VkDevice` handle
- **pInfo** **must** be a valid pointer to a valid `VkBufferMemoryRequirementsInfo2` structure
- **pMemoryRequirements** **must** be a valid pointer to a `VkMemoryRequirements2` structure

The `VkBufferMemoryRequirementsInfo2` structure is defined as:

```
typedef struct VkBufferMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
} VkBufferMemoryRequirementsInfo2;
```

or the equivalent

```
typedef VkBufferMemoryRequirementsInfo2 VkBufferMemoryRequirementsInfo2KHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **buffer** is the buffer to query.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_MEMORY_REQUIREMENTS_INFO_2`
- `pNext` **must** be `NULL`
- `buffer` **must** be a valid `VkBuffer` handle

To determine the memory requirements for an image resource, call:

```
void vkGetImageMemoryRequirements2(
    VkDevice                                     device,
    const VkImageMemoryRequirementsInfo2*        pInfo,
    VkMemoryRequirements2*                      pMemoryRequirements);
```

or the equivalent command

```
void vkGetImageMemoryRequirements2KHR(
    VkDevice                                     device,
    const VkImageMemoryRequirementsInfo2*       pInfo,
    VkMemoryRequirements2*                     pMemoryRequirements);
```

- `device` is the logical device that owns the image.
- `pInfo` is a pointer to a `VkImageMemoryRequirementsInfo2` structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the image object are returned.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pInfo` **must** be a valid pointer to a valid `VkImageMemoryRequirementsInfo2` structure
- `pMemoryRequirements` **must** be a valid pointer to a `VkMemoryRequirements2` structure

The `VkImageMemoryRequirementsInfo2` structure is defined as:

```
typedef struct VkImageMemoryRequirementsInfo2 {
    VkStructureType    sType;
    const void*       pNext;
    VkImage           image;
} VkImageMemoryRequirementsInfo2;
```

or the equivalent

```
typedef VkImageMemoryRequirementsInfo2 VkImageMemoryRequirementsInfo2KHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **image** is the image to query.

## Valid Usage

- If **image** was created with a *multi-planar* format and the **VK\_IMAGE\_CREATE\_DISJOINT\_BIT** flag, there **must** be a **VkImagePlaneMemoryRequirementsInfo** in the **pNext** chain of the **VkImageMemoryRequirementsInfo2** structure
- If **image** was created with **VK\_IMAGE\_CREATE\_DISJOINT\_BIT** and with **VK\_IMAGE\_TILING\_DRM\_FORMAT\_MODIFIER\_EXT**, then there **must** be a **VkImagePlaneMemoryRequirementsInfo** in the **pNext** chain of the **VkImageMemoryRequirementsInfo2** structure
- If **image** was not created with the **VK\_IMAGE\_CREATE\_DISJOINT\_BIT** flag, there **must** not be a **VkImagePlaneMemoryRequirementsInfo** in the **pNext** chain of the **VkImageMemoryRequirementsInfo2** structure
- If **image** was created with a single-plane format and with any **tiling** other than **VK\_IMAGE\_TILING\_DRM\_FORMAT\_MODIFIER\_EXT**, then there **must** not be a **VkImagePlaneMemoryRequirementsInfo** in the **pNext** chain of the **VkImageMemoryRequirementsInfo2** structure
- If **image** was created with the **VK\_EXTERNAL\_MEMORY\_HANDLE\_TYPE\_ANDROID\_HARDWARE\_BUFFER\_BIT\_ANDROID** external memory handle type, then **image** **must** be bound to memory.

## Valid Usage (Implicit)

- **sType** **must** be **VK\_STRUCTURE\_TYPE\_IMAGE\_MEMORY\_REQUIREMENTS\_INFO\_2**
- **pNext** **must** be **NULL** or a pointer to a valid instance of **VkImagePlaneMemoryRequirementsInfo**
- **image** **must** be a valid **VkImage** handle

To determine the memory requirements for a plane of a disjoint image, add a **VkImagePlaneMemoryRequirementsInfo** to the **pNext** chain of the **VkImageMemoryRequirementsInfo2** structure.

The **VkImagePlaneMemoryRequirementsInfo** structure is defined as:

```
typedef struct VkImagePlaneMemoryRequirementsInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkImageAspectFlagBits planeAspect;
} VkImagePlaneMemoryRequirementsInfo;
```

or the equivalent

```
typedef VkImagePlaneMemoryRequirementsInfo VkImagePlaneMemoryRequirementsInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `planeAspect` is the aspect corresponding to the image plane to query.

## Valid Usage

- If the image's tiling is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, then `planeAspect` **must** be a single valid *format plane* for the image. (That is, for a two-plane image `planeAspect` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT` or `VK_IMAGE_ASPECT_PLANE_1_BIT`, and for a three-plane image `planeAspect` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`).
- If the image's tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `planeAspect` **must** be a single valid *memory plane* for the image. (That is, `aspectMask` **must** specify a plane index that is less than the `drmFormatModifierPlaneCount` associated with the image's `format` and `drmFormatModifier`.)

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_PLANE_MEMORY_REQUIREMENTS_INFO`
- `planeAspect` **must** be a valid `VkImageAspectFlagBits` value

The `VkMemoryRequirements2` structure is defined as:

```
typedef struct VkMemoryRequirements2 {
    VkStructureType      sType;
    void*               pNext;
    VkMemoryRequirements memoryRequirements;
} VkMemoryRequirements2;
```

or the equivalent

```
typedef VkMemoryRequirements2 VkMemoryRequirements2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `memoryRequirements` is a `VkMemoryRequirements` structure describing the memory requirements of the resource.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_REQUIREMENTS_2`
- `pNext` **must** be `NULL` or a pointer to a valid instance of `VkMemoryDedicatedRequirements`

To determine the dedicated allocation requirements of a buffer or image resource, add a `VkMemoryDedicatedRequirements` structure to the `pNext` chain of the `VkMemoryRequirements2` structure passed as the `pMemoryRequirements` parameter of `vkGetBufferMemoryRequirements2` or `vkGetImageMemoryRequirements2`.

The `VkMemoryDedicatedRequirements` structure is defined as:

```
typedef struct VkMemoryDedicatedRequirements {  
    VkStructureType    sType;  
    void*              pNext;  
    VkBool32            prefersDedicatedAllocation;  
    VkBool32            requiresDedicatedAllocation;  
} VkMemoryDedicatedRequirements;
```

or the equivalent

```
typedef VkMemoryDedicatedRequirements VkMemoryDedicatedRequirementsKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `prefersDedicatedAllocation` specifies that the implementation would prefer a dedicated allocation for this resource. The application is still free to suballocate the resource but it **may** get better performance if a dedicated allocation is used.
- `requiresDedicatedAllocation` specifies that a dedicated allocation is required for this resource.

When the implementation sets `requiresDedicatedAllocation` to `VK_TRUE`, it **must** also set `prefersDedicatedAllocation` to `VK_TRUE`.

If the `VkMemoryDedicatedRequirements` structure is included in the `pNext` chain of the `VkMemoryRequirements2` structure passed as the `pMemoryRequirements` parameter of a `vkGetBufferMemoryRequirements2` call, `requiresDedicatedAllocation` **may** be `VK_TRUE` under one of the

following conditions:

- The `pNext` chain of `VkBufferCreateInfo` for the call to `vkCreateBuffer` used to create the buffer being queried contained an instance of `VkExternalMemoryBufferCreateInfo`, and any of the handle types specified in `VkExternalMemoryBufferCreateInfo::handleTypes` requires dedicated allocation, as reported by `vkGetPhysicalDeviceExternalBufferProperties` in `VkExternalBufferProperties::externalMemoryProperties::externalMemoryFeatures`, the `requiresDedicatedAllocation` field will be set to `VK_TRUE`.

In all other cases, `requiresDedicatedAllocation` **must** be set to `VK_FALSE` by the implementation whenever a `VkMemoryDedicatedRequirements` structure is included in the `pNext` chain of the `VkMemoryRequirements2` structure passed to a call to `vkGetBufferMemoryRequirements2`.

If the `VkMemoryDedicatedRequirements` structure is included in the `pNext` chain of the `VkMemoryRequirements2` structure passed as the `pMemoryRequirements` parameter of a `vkGetBufferMemoryRequirements2` call and `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` was set in `VkBufferCreateInfo::flags` when `buffer` was created then the implementation **must** set both `prefersDedicatedAllocation` and `requiresDedicatedAllocation` to `VK_FALSE`.

If the `VkMemoryDedicatedRequirements` structure is included in the `pNext` chain of the `VkMemoryRequirements2` structure passed as the `pMemoryRequirements` parameter of a `vkGetImageMemoryRequirements2` call, `requiresDedicatedAllocation` **may** be `VK_TRUE` under one of the following conditions:

- The `pNext` chain of `VkImageCreateInfo` for the call to `vkCreateImage` used to create the image being queried contained an instance of `VkExternalMemoryImageCreateInfo`, and any of the handle types specified in `VkExternalMemoryImageCreateInfo::handleTypes` requires dedicated allocation, as reported by `vkGetPhysicalDeviceImageFormatProperties2` in `VkExternalImageFormatProperties::externalMemoryProperties::externalMemoryFeatures`, the `requiresDedicatedAllocation` field will be set to `VK_TRUE`.

In all other cases, `requiresDedicatedAllocation` **must** be set to `VK_FALSE` by the implementation whenever a `VkMemoryDedicatedRequirements` structure is included in the `pNext` chain of the `VkMemoryRequirements2` structure passed to a call to `vkGetImageMemoryRequirements2`.

If the `VkMemoryDedicatedRequirements` structure is included in the `pNext` chain of the `VkMemoryRequirements2` structure passed as the `pMemoryRequirements` parameter of a `vkGetImageMemoryRequirements2` call and `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` was set in `VkImageCreateInfo::flags` when `image` was created then the implementation **must** set both `prefersDedicatedAllocation` and `requiresDedicatedAllocation` to `VK_FALSE`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_MEMORY_DEDICATED_REQUIREMENTS`

To attach memory to a buffer object, call:

```
VkResult vkBindBufferMemory(  
    VkDevice device,  
    VkBuffer buffer,  
    VkDeviceMemory memory,  
    VkDeviceSize memoryOffset);
```

- **device** is the logical device that owns the buffer and memory.
- **buffer** is the buffer to be attached to memory.
- **memory** is a [VkDeviceMemory](#) object describing the device memory to attach.
- **memoryOffset** is the start offset of the region of **memory** which is to be bound to the buffer. The number of bytes returned in the [VkMemoryRequirements::size](#) member in **memory**, starting from **memoryOffset** bytes, will be bound to the specified buffer.

[vkBindBufferMemory](#) is equivalent to passing the same parameters through [VkBindBufferMemoryInfo](#) to [vkBindBufferMemory2](#).

## Valid Usage

- `buffer` **must** not already be backed by a memory object
- `buffer` **must** not have been created with any sparse memory binding flags
- `memoryOffset` **must** be less than the size of `memory`
- `memory` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`
- `memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`
- The `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer` **must** be less than or equal to the size of `memory` minus `memoryOffset`
- If `buffer` requires a dedicated allocation(as reported by `vkGetBufferMemoryRequirements2` `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` for `buffer`), `memory` **must** have been created with `VkMemoryDedicatedAllocateInfo::buffer` equal to `buffer`
- If the `VkMemoryAllocateInfo` provided when `memory` was allocated included an instance of `VkMemoryDedicatedAllocateInfo` in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::buffer` was not `VK_NULL_HANDLE`, then `buffer` **must** equal `VkMemoryDedicatedAllocateInfo::buffer`, and `memoryOffset` **must** be zero.
- If `buffer` was created with the `VK_BUFFER_CREATE_PROTECTED_BIT` bit set, the buffer **must** be bound to a memory object allocated with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`
- If `buffer` was created with the `VK_BUFFER_CREATE_PROTECTED_BIT` bit not set, the buffer **must** not be bound to a memory object created with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`
- If `buffer` was created with `VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation` equal to `VK_TRUE`, `memory` **must** have been created with `VkDedicatedAllocationMemoryAllocateInfoNV::buffer` equal to a buffer handle created with identical creation parameters to `buffer` and `memoryOffset` **must** be zero
- If the value of `VkExportMemoryAllocateInfo::handleTypes` used to allocate `memory` is not `0`, it **must** include at least one of the handles set in `VkExternalMemoryBufferCreateInfo::handleTypes` when `buffer` was created
- If `memory` was created by a memory import operation, the external handle type of the imported memory **must** also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` when `buffer` was created
- If the `VkPhysicalDeviceBufferDeviceAddressFeaturesKHR::bufferDeviceAddress` feature is enabled and `buffer` was created with the `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_KHR` bit set, `memory` **must** have been allocated with the `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT_KHR` bit set

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `buffer` **must** be a valid `VkBuffer` handle
- `memory` **must** be a valid `VkDeviceMemory` handle
- `buffer` **must** have been created, allocated, or retrieved from `device`
- `memory` **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `buffer` **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`

To attach memory to buffer objects for one or more buffers at a time, call:

```
VkResult vkBindBufferMemory2(  
    VkDevice                                     device,  
    uint32_t                                      bindInfoCount,  
    const VkBindBufferMemoryInfo*                  pBindInfos);
```

or the equivalent command

```
VkResult vkBindBufferMemory2KHR(  
    VkDevice                                     device,  
    uint32_t                                      bindInfoCount,  
    const VkBindBufferMemoryInfo*                  pBindInfos);
```

- `device` is the logical device that owns the buffers and memory.
- `bindInfoCount` is the number of elements in `pBindInfos`.
- `pBindInfos` is a pointer to an array of `bindInfoCount` `VkBindBufferMemoryInfo` structures describing buffers and memory to bind.

On some implementations, it **may** be more efficient to batch memory bindings into a single command.

## Valid Usage (Implicit)

- **device** **must** be a valid `VkDevice` handle
- **pBindInfos** **must** be a valid pointer to an array of `bindInfoCount` valid `VkBindBufferMemoryInfo` structures
- **bindInfoCount** **must** be greater than `0`

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`

`VkBindBufferMemoryInfo` contains members corresponding to the parameters of `vkBindBufferMemory`.

The `VkBindBufferMemoryInfo` structure is defined as:

```
typedef struct VkBindBufferMemoryInfo {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
} VkBindBufferMemoryInfo;
```

or the equivalent

```
typedef VkBindBufferMemoryInfo VkBindBufferMemoryInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to an extension-specific structure.
- **buffer** is the buffer to be attached to memory.
- **memory** is a `VkDeviceMemory` object describing the device memory to attach.
- **memoryOffset** is the start offset of the region of `memory` which is to be bound to the buffer. The

number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified buffer.

## Valid Usage

- `buffer` **must** not already be backed by a memory object
- `buffer` **must** not have been created with any sparse memory binding flags
- `memoryOffset` **must** be less than the size of `memory`
- `memory` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`
- `memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`
- The `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer` **must** be less than or equal to the size of `memory` minus `memoryOffset`
- If `buffer` requires a dedicated allocation (as reported by `vkGetBufferMemoryRequirements2` in `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` for `buffer`), `memory` **must** have been created with `VkMemoryDedicatedAllocateInfo::buffer` equal to `buffer` and `memoryOffset` **must** be zero
- If the `VkMemoryAllocateInfo` provided when `memory` was allocated included an instance of `VkMemoryDedicatedAllocateInfo` in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::buffer` was not `VK_NULL_HANDLE`, then `buffer` **must** equal `VkMemoryDedicatedAllocateInfo::buffer` and `memoryOffset` **must** be zero.
- If `buffer` was created with `VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation` equal to `VK_TRUE`, `memory` **must** have been created with `VkDedicatedAllocationMemoryAllocateInfoNV::buffer` equal to `buffer` and `memoryOffset` **must** be zero
- If the `pNext` chain includes `VkBIndBufferMemoryDeviceGroupInfo`, all instances of `memory` specified by `VkBIndBufferMemoryDeviceGroupInfo::pDeviceIndices` **must** have been allocated
- If the value of `VkExportMemoryAllocateInfo::handleTypes` used to allocate `memory` is not `0`, it **must** include at least one of the handles set in `VkExternalMemoryBufferCreateInfo::handleTypes` when `buffer` was created
- If `memory` was created by a memory import operation, the external handle type of the imported memory **must** also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` when `buffer` was created

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_INFO`
- `pNext` must be `NULL` or a pointer to a valid instance of `VkBindBufferMemoryDeviceGroupInfo`
- `buffer` must be a valid `VkBuffer` handle
- `memory` must be a valid `VkDeviceMemory` handle
- Both of `buffer`, and `memory` must have been created, allocated, or retrieved from the same `VkDevice`

```
typedef struct VkBindBufferMemoryDeviceGroupInfo {  
    VkStructureType sType;  
    const void* pNext;  
    uint32_t deviceIndexCount;  
    const uint32_t* pDeviceIndices;  
} VkBindBufferMemoryDeviceGroupInfo;
```

or the equivalent

```
typedef VkBindBufferMemoryDeviceGroupInfo VkBindBufferMemoryDeviceGroupInfoKHR;
```

If the `pNext` list of `VkBindBufferMemoryInfo` includes a `VkBindBufferMemoryDeviceGroupInfo` structure, then that structure determines how memory is bound to buffers across multiple devices in a device group.

The `VkBindBufferMemoryDeviceGroupInfo` structure is defined as:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `deviceIndexCount` is the number of elements in `pDeviceIndices`.
- `pDeviceIndices` is a pointer to an array of device indices.

If `deviceIndexCount` is greater than zero, then on device index `i` the buffer is attached to the instance of `memory` on the physical device with device index `pDeviceIndices[i]`.

If `deviceIndexCount` is zero and `memory` comes from a memory heap with the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of `memory`.

If `deviceIndexCount` is zero and `memory` comes from a memory heap without the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains an array of zeros. In other words, by default each physical device attaches to instance zero.

## Valid Usage

- `deviceIndexCount` **must** either be zero or equal to the number of physical devices in the logical device
- All elements of `pDeviceIndices` **must** be valid device indices

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_DEVICE_GROUP_INFO`
- If `deviceIndexCount` is not `0`, `pDeviceIndices` **must** be a valid pointer to an array of `deviceIndexCount` `uint32_t` values

To attach memory to a `VkImage` object created without the `VK_IMAGE_CREATE_DISJOINT_BIT` set, call:

```
VkResult vkBindImageMemory(  
    VkDevice                          device,  
    VkImage                           image,  
    VkDeviceMemory                    memory,  
    VkDeviceSize                     memoryOffset);
```

- `device` is the logical device that owns the image and memory.
- `image` is the image.
- `memory` is the `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the image. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified image.

`vkBindImageMemory` is equivalent to passing the same parameters through `VkBindImageMemoryInfo` to `vkBindImageMemory2`.

## Valid Usage

- `image` **must** not have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` set.
- `image` **must** not already be backed by a memory object
- `image` **must** not have been created with any sparse memory binding flags
- `memoryOffset` **must** be less than the size of `memory`
- `memory` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with `image`
- `memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with `image`
- The `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with `image` **must** be less than or equal to the size of `memory` minus `memoryOffset`
- If `image` requires a dedicated allocation (as reported by `vkGetImageMemoryRequirements2` `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` for `image`), `memory` **must** have been created with `VkMemoryDedicatedAllocateInfo::image` equal to `image`
- If the dedicated allocation image aliasing feature is not enabled, and the `VkMemoryAllocateInfo` provided when `memory` was allocated included an instance of `VkMemoryDedicatedAllocateInfo` in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::image` was not `VK_NULL_HANDLE`, then `image` **must** equal `VkMemoryDedicatedAllocateInfo::image` and `memoryOffset` **must** be zero.
- If the dedicated allocation image aliasing feature is enabled, and the `VkMemoryAllocateInfo` provided when `memory` was allocated included an instance of `VkMemoryDedicatedAllocateInfo` in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::image` was not `VK_NULL_HANDLE`, then `memoryOffset` **must** be zero, and `image` **must** be either equal to `VkMemoryDedicatedAllocateInfo::image` or an image that was created using the same parameters in `VkImageCreateInfo`, with the exception that `extent` and `arrayLayers` **may** differ subject to the following restrictions: every dimension in the `extent` parameter of the image being bound **must** be equal to or smaller than the original image for which the allocation was created; and the `arrayLayers` parameter of the image being bound **must** be equal to or smaller than the original image for which the allocation was created.
- If `image` was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit set, the `image` **must** be bound to a memory object allocated with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`
- If `image` was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit not set, the `image` **must** not be bound to a memory object created with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`
- If `image` was created with `VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation` equal to `VK_TRUE`, `memory` **must** have been created with

`VkDedicatedAllocationMemoryAllocateInfoNV::image` equal to an image handle created with identical creation parameters to `image` and `memoryOffset` **must** be zero

- If the value of `VkExportMemoryAllocateInfo::handleTypes` used to allocate `memory` is not `0`, it **must** include at least one of the handles set in `VkExternalMemoryImageCreateInfo ::handleTypes` when `image` was created
- If `memory` was created by a memory import operation, the external handle type of the imported memory **must** also have been set in `VkExternalMemoryImageCreateInfo ::handleTypes` when `image` was created

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `image` **must** be a valid `VkImage` handle
- `memory` **must** be a valid `VkDeviceMemory` handle
- `image` **must** have been created, allocated, or retrieved from `device`
- `memory` **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `image` **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To attach memory to image objects for one or more images at a time, call:

```
VkResult vkBindImageMemory2(  
    VkDevice device,  
    uint32_t bindInfoCount,  
    const VkBindImageMemoryInfo* pBindInfos);
```

or the equivalent command

```

VkResult vkBindImageMemory2KHR(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindImageMemoryInfo* pBindInfos);

```

- `device` is the logical device that owns the images and memory.
- `bindInfoCount` is the number of elements in `pBindInfos`.
- `pBindInfos` is a pointer to an array of `VkBindImageMemoryInfo` structures, describing images and memory to bind.

On some implementations, it **may** be more efficient to batch memory bindings into a single command.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pBindInfos` **must** be a valid pointer to an array of `bindInfoCount` valid `VkBindImageMemoryInfo` structures
- `bindInfoCount` **must** be greater than 0

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

`VkBindImageMemoryInfo` contains members corresponding to the parameters of `vkBindImageMemory`.

The `VkBindImageMemoryInfo` structure is defined as:

```

typedef struct VkBindImageMemoryInfo {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
} VkBindImageMemoryInfo;

```

or the equivalent

```
typedef VkBindImageMemoryInfo VkBindImageMemoryInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **image** is the image to be attached to memory.
- **memory** is a [VkDeviceMemory](#) object describing the device memory to attach.
- **memoryOffset** is the start offset of the region of **memory** which is to be bound to the image. The number of bytes returned in the [VkMemoryRequirements::size](#) member in **memory**, starting from **memoryOffset** bytes, will be bound to the specified image.

## Valid Usage

- `image` **must** not already be backed by a memory object
- `image` **must** not have been created with any sparse memory binding flags
- `memoryOffset` **must** be less than the size of `memory`
- If the `pNext` chain does not include an instance of the `VkBindImagePlaneMemoryInfo` structure, `memory` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with `image`
- If the `pNext` chain does not include an instance of the `VkBindImagePlaneMemoryInfo` structure, `memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with `image`
- If the `pNext` chain does not include an instance of the `VkBindImagePlaneMemoryInfo` structure, the difference of the size of `memory` and `memoryOffset` **must** be greater than or equal to the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with the same `image`
- If the `pNext` chain includes an instance of the `VkBindImagePlaneMemoryInfo` structure, `image` **must** have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` bit set.
- If the `pNext` chain includes an instance of the `VkBindImagePlaneMemoryInfo` structure, `memory` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with `image` and the correct `planeAspect` for this plane in the `VkImagePlaneMemoryRequirementsInfo` structure attached to the `VkImageMemoryRequirementsInfo2`'s `pNext` chain
- If the `pNext` chain includes an instance of the `VkBindImagePlaneMemoryInfo` structure, `memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with `image` and the correct `planeAspect` for this plane in the `VkImagePlaneMemoryRequirementsInfo` structure attached to the `VkImageMemoryRequirementsInfo2`'s `pNext` chain
- If the `pNext` chain includes an instance of the `VkBindImagePlaneMemoryInfo` structure, the difference of the size of `memory` and `memoryOffset` **must** be greater than or equal to the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with the same `image` and the correct `planeAspect` for this plane in the `VkImagePlaneMemoryRequirementsInfo` structure attached to the `VkImageMemoryRequirementsInfo2`'s `pNext` chain
- If `image` requires a dedicated allocation (as reported by `vkGetImageMemoryRequirements2` in `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` for `image`), `memory` **must** have been created with `VkMemoryDedicatedAllocateInfo::image` equal to `image` and `memoryOffset` **must** be zero
- If the dedicated allocation image aliasing feature is not enabled, and the

`VkMemoryAllocateInfo` provided when `memory` was allocated included an instance of `VkMemoryDedicatedAllocateInfo` in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::image` was not `VK_NULL_HANDLE`, then `image must` equal `VkMemoryDedicatedAllocateInfo::image` and `memoryOffset must` be zero.

- If the dedicated allocation image aliasing feature is enabled, and the `VkMemoryAllocateInfo` provided when `memory` was allocated included an instance of `VkMemoryDedicatedAllocateInfo` in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::image` was not `VK_NULL_HANDLE`, then `memoryOffset must` be zero, and `image must` be either equal to `VkMemoryDedicatedAllocateInfo::image` or an image that was created using the same parameters in `VkImageCreateInfo`, with the exception that `extent` and `arrayLayers` **may** differ subject to the following restrictions: every dimension in the `extent` parameter of the image being bound **must** be equal to or smaller than the original image for which the allocation was created; and the `arrayLayers` parameter of the image being bound **must** be equal to or smaller than the original image for which the allocation was created.
- If `image` was created with `VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation` equal to `VK_TRUE`, `memory must` have been created with `VkDedicatedAllocationMemoryAllocateInfoNV::image` equal to `image` and `memoryOffset must` be zero
- If the `pNext` chain includes `VkBindImageMemoryDeviceGroupInfo`, all instances of `memory` specified by `VkBindImageMemoryDeviceGroupInfo::pDeviceIndices` **must** have been allocated
- If the `pNext` chain includes `VkBindImageMemoryDeviceGroupInfo`, and `VkBindImageMemoryDeviceGroupInfo::splitInstanceBindRegionCount` is not zero, then `image must` have been created with the `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` bit set
- If the `pNext` chain includes `VkBindImageMemoryDeviceGroupInfo`, all elements of `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions` **must** be valid rectangles contained within the dimensions of `image`
- If the `pNext` chain includes `VkBindImageMemoryDeviceGroupInfo`, the union of the areas of all elements of `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions` that correspond to the same instance of `image` **must** cover the entire image.
- If `image` was created with a valid swapchain handle in `VkImageSwapchainCreateInfoKHR::swapchain`, then the `pNext` chain **must** include a valid instance of `VkBindImageMemorySwapchainInfoKHR` containing the same swapchain handle.
- If the `pNext` chain includes an instance of `VkBindImageMemorySwapchainInfoKHR`, `memory must` be `VK_NULL_HANDLE`
- If the `pNext` chain does not include an instance of `VkBindImageMemorySwapchainInfoKHR`, `memory must` be a valid `VkDeviceMemory` handle
- If the value of `VkExportMemoryAllocateInfo::handleTypes` used to allocate `memory` is not `0`, it **must** include at least one of the handles set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created

- If `memory` was created by a memory import operation, the external handle type of the imported memory **must** also have been set in `VkExternalMemoryImageCreateInfo` `::handleTypes` when `image` was created

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkBindImageMemoryDeviceGroupInfo`, `VkBindImageMemorySwapchainInfoKHR`, or `VkBindImagePlaneMemoryInfo`
- Each `sType` member in the `pNext` chain **must** be unique
- `image` **must** be a valid `VkImage` handle
- Both of `image`, and `memory` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

```
typedef struct VkBindImageMemoryDeviceGroupInfo {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           deviceIndexCount;
    const uint32_t*    pDeviceIndices;
    uint32_t           splitInstanceBindRegionCount;
    const VkRect2D*    pSplitInstanceBindRegions;
} VkBindImageMemoryDeviceGroupInfo;
```

or the equivalent

```
typedef VkBindImageMemoryDeviceGroupInfo VkBindImageMemoryDeviceGroupInfoKHR;
```

If the `pNext` list of `VkBindImageMemoryInfo` includes a `VkBindImageMemoryDeviceGroupInfo` structure, then that structure determines how memory is bound to images across multiple devices in a device group.

The `VkBindImageMemoryDeviceGroupInfo` structure is defined as:

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `deviceIndexCount` is the number of elements in `pDeviceIndices`.
- `pDeviceIndices` is a pointer to an array of device indices.
- `splitInstanceBindRegionCount` is the number of elements in `pSplitInstanceBindRegions`.
- `pSplitInstanceBindRegions` is a pointer to an array of `VkRect2D` structures describing which regions of the image are attached to each instance of memory.

If `deviceIndexCount` is greater than zero, then on device index `i` `image` is attached to the instance of the memory on the physical device with device index `pDeviceIndices[i]`.

Let  $N$  be the number of physical devices in the logical device. If `splitInstanceBindRegionCount` is greater than zero, then `pSplitInstanceBindRegions` is an array of  $N^2$  rectangles, where the image region specified by the rectangle at element  $i*N+j$  in resource instance  $i$  is bound to the memory instance  $j$ . The blocks of the memory that are bound to each sparse image block region use an offset in memory, relative to `memoryOffset`, computed as if the whole image were being bound to a contiguous range of memory. In other words, horizontally adjacent image blocks use consecutive blocks of memory, vertically adjacent image blocks are separated by the number of bytes per block multiplied by the width in blocks of `image`, and the block at  $(0,0)$  corresponds to memory starting at `memoryOffset`.

If `splitInstanceBindRegionCount` and `deviceIndexCount` are zero and the memory comes from a memory heap with the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of the memory.

If `splitInstanceBindRegionCount` and `deviceIndexCount` are zero and the memory comes from a memory heap without the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains an array of zeros. In other words, by default each physical device attaches to instance zero.

## Valid Usage

- At least one of `deviceIndexCount` and `splitInstanceBindRegionCount` **must** be zero.
- `deviceIndexCount` **must** either be zero or equal to the number of physical devices in the logical device
- All elements of `pDeviceIndices` **must** be valid device indices.
- `splitInstanceBindRegionCount` **must** either be zero or equal to the number of physical devices in the logical device squared
- Elements of `pSplitInstanceBindRegions` that correspond to the same instance of an image **must** not overlap.
- The `offset.x` member of any element of `pSplitInstanceBindRegions` **must** be a multiple of the sparse image block width (`VkSparseImageFormatProperties::imageGranularity.width`) of all non-metadata aspects of the image
- The `offset.y` member of any element of `pSplitInstanceBindRegions` **must** be a multiple of the sparse image block height (`VkSparseImageFormatProperties::imageGranularity.height`) of all non-metadata aspects of the image
- The `extent.width` member of any element of `pSplitInstanceBindRegions` **must** either be a multiple of the sparse image block width of all non-metadata aspects of the image, or else `extent.width + offset.x` **must** equal the width of the image subresource
- The `extent.height` member of any element of `pSplitInstanceBindRegions` **must** either be a multiple of the sparse image block height of all non-metadata aspects of the image, or else `extent.height + offset.y` **must** equal the width of the image subresource

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_DEVICE_GROUP_INFO`
- If `deviceIndexCount` is not `0`, `pDeviceIndices` **must** be a valid pointer to an array of `deviceIndexCount uint32_t` values
- If `splitInstanceBindRegionCount` is not `0`, `pSplitInstanceBindRegions` **must** be a valid pointer to an array of `splitInstanceBindRegionCount VkRect2D` structures

If the `pNext` chain of `VkBindImageMemoryInfo` includes a `VkBindImageMemorySwapchainInfoKHR` structure, then that structure includes a swapchain handle and image index indicating that the image will be bound to memory from that swapchain.

The `VkBindImageMemorySwapchainInfoKHR` structure is defined as:

```
typedef struct VkBindImageMemorySwapchainInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSwapchainKHR     swapchain;
    uint32_t           imageIndex;
} VkBindImageMemorySwapchainInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `swapchain` is `VK_NULL_HANDLE` or a swapchain handle.
- `imageIndex` is an image index within `swapchain`.

If `swapchain` is not `NULL`, the `swapchain` and `imageIndex` are used to determine the memory that the image is bound to, instead of `memory` and `memoryOffset`.

Memory **can** be bound to a swapchain and use the `pDeviceIndices` or `pSplitInstanceBindRegions` members of `VkBindImageMemoryDeviceGroupInfo`.

## Valid Usage

- `imageIndex` **must** be less than the number of images in `swapchain`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR`
- `swapchain` **must** be a valid `VkSwapchainKHR` handle

## Host Synchronization

- Host access to `swapchain` **must** be externally synchronized

In order to bind *planes* of a *disjoint image*, include a `VkBindImagePlaneMemoryInfo` structure in the `pNext` chain of `VkBindImageMemoryInfo`.

The `VkBindImagePlaneMemoryInfo` structure is defined as:

```
typedef struct VkBindImagePlaneMemoryInfo {
    VkStructureType      sType;
    const void*          pNext;
    VkImageAspectFlagBits planeAspect;
} VkBindImagePlaneMemoryInfo;
```

or the equivalent

```
typedef VkBindImagePlaneMemoryInfo VkBindImagePlaneMemoryInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `planeAspect` is the aspect of the disjoint image plane to bind.

## Valid Usage

- If the image's tiling is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, then `planeAspect` **must** be a single valid *format plane* for the image. (That is, `planeAspect` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT` or `VK_IMAGE_ASPECT_PLANE_1_BIT` for “`_2PLANE`” formats and `planeAspect` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT` for “`_3PLANE`” formats.)
- If the image's tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `planeAspect` **must** be a single valid *memory plane* for the image. (That is, `aspectMask` **must** specify a plane index that is less than the `drmFormatModifierPlaneCount` associated with the image's `format` and `drmFormatModifier`.)
- A single call to `vkBindImageMemory2` **must** bind all or none of the planes of an image (i.e. bindings to all planes of an image **must** be made in a single `vkBindImageMemory2` call), as separate bindings

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_BIND_IMAGE_PLANE_MEMORY_INFO`
- `planeAspect` **must** be a valid `VkImageAspectFlagBits` value

### Buffer-Image Granularity

There is an implementation-dependent limit, `bufferImageGranularity`, which specifies a page-like granularity at which linear and non-linear resources **must** be placed in adjacent memory locations to avoid aliasing. Two resources which do not satisfy this granularity requirement are said to `alias`. `bufferImageGranularity` is specified in bytes, and **must** be a power of two. Implementations which do not impose a granularity restriction **may** report a `bufferImageGranularity` value of one.

#### Note

Despite its name, `bufferImageGranularity` is really a granularity between “linear” and “non-linear” resources.

Given `resourceA` at the lower memory offset and `resourceB` at the higher memory offset in the same `VkDeviceMemory` object, where one resource is linear and the other is non-linear (as defined in the [Glossary](#)), and the following:

```
resourceA.end      = resourceA.memoryOffset + resourceA.size - 1
resourceA.endPage = resourceA.end & ~(bufferImageGranularity-1)
resourceB.start    = resourceB.memoryOffset
resourceB.startPage = resourceB.start & ~(bufferImageGranularity-1)
```

The following property **must** hold:

```
resourceA.endPage < resourceB.startPage
```

That is, the end of the first resource (A) and the beginning of the second resource (B) **must** be on separate “pages” of size `bufferImageGranularity`. `bufferImageGranularity` **may** be different than the physical page size of the memory heap. This restriction is only needed when a linear resource and a non-linear resource are adjacent in memory and will be used simultaneously. The memory ranges of adjacent resources **can** be closer than `bufferImageGranularity`, provided they meet the `alignment` requirement for the objects in question.

Sparse block size in bytes and sparse image and buffer memory alignments **must** all be multiples of the `bufferImageGranularity`. Therefore, memory bound to sparse resources naturally satisfies the `bufferImageGranularity`.

## 11.7. Resource Sharing Mode

Buffer and image objects are created with a *sharing mode* controlling how they **can** be accessed from queues. The supported sharing modes are:

```
typedef enum VkSharingMode {
    VK_SHARING_MODE_EXCLUSIVE = 0,
    VK_SHARING_MODE_CONCURRENT = 1,
    VK_SHARING_MODE_MAX_ENUM = 0x7FFFFFFF
} VkSharingMode;
```

- `VK_SHARING_MODE_EXCLUSIVE` specifies that access to any range or image subresource of the object will be exclusive to a single queue family at a time.
- `VK_SHARING_MODE_CONCURRENT` specifies that concurrent access to any range or image subresource of the object from multiple queue families is supported.

*Note*

`VK_SHARING_MODE_CONCURRENT` **may** result in lower performance access to the buffer or image than `VK_SHARING_MODE_EXCLUSIVE`.

Ranges of buffers and image subresources of image objects created using `VK_SHARING_MODE_EXCLUSIVE` **must** only be accessed by queues in the queue family that has *ownership* of the resource. Upon creation, such resources are not owned by any queue family; ownership is implicitly acquired upon first use within a queue. Once a resource using `VK_SHARING_MODE_EXCLUSIVE` is owned by some queue family, the application **must** perform a `queue family ownership transfer` to make the memory

contents of a range or image subresource accessible to a different queue family.

*Note*

Images still require a [layout transition](#) from `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED` before being used on the first queue.

A queue family **can** take ownership of an image subresource or buffer range of a resource created with `VK_SHARING_MODE_EXCLUSIVE`, without an ownership transfer, in the same way as for a resource that was just created; however, taking ownership in this way has the effect that the contents of the image subresource or buffer range are undefined.

Ranges of buffers and image subresources of image objects created using `VK_SHARING_MODE_CONCURRENT` **must** only be accessed by queues from the queue families specified through the `queueFamilyIndexCount` and `pQueueFamilyIndices` members of the corresponding create info structures.

### 11.7.1. External Resource Sharing

Resources **should** only be accessed in the Vulkan instance that has exclusive ownership of their underlying memory. Only one Vulkan instance has exclusive ownership of a resource's underlying memory at a given time, regardless of whether the resource was created using `VK_SHARING_MODE_EXCLUSIVE` or `VK_SHARING_MODE_CONCURRENT`. Applications can transfer ownership of a resource's underlying memory only if the memory has been imported from or exported to another instance or external API using external memory handles. The semantics for transferring ownership outside of the instance are similar to those used for transferring ownership of `VK_SHARING_MODE_EXCLUSIVE` resources between queues, and is also accomplished using `VkBufferMemoryBarrier` or `VkImageMemoryBarrier` operations. Applications **must**

1. Release exclusive ownership from the source instance or API.
2. Ensure the release operation has completed using semaphores or fences.
3. Acquire exclusive ownership in the destination instance or API

Unlike queue ownership transfers, the destination instance or API is not specified explicitly when releasing ownership, nor is the source instance or API specified when acquiring ownership. Instead, the image or memory barrier's `dstQueueFamilyIndex` or `srcQueueFamilyIndex` parameters are set to the reserved queue family index `VK_QUEUE_FAMILY_EXTERNAL` or `VK_QUEUE_FAMILY_FOREIGN_EXT` to represent the external destination or source respectively.

Binding a resource to a memory object shared between multiple Vulkan instances or other APIs does not change the ownership of the underlying memory. The first entity to access the resource implicitly acquires ownership. Accessing a resource backed by memory that is owned by a particular instance or API has the same semantics as accessing a `VK_SHARING_MODE_EXCLUSIVE` resource, with one exception: Implementations **must** ensure layout transitions performed on one member of a set of identical subresources of identical images that alias the same range of an underlying memory object affect the layout of all the subresources in the set.

As a corollary, writes to any image subresources in such a set **must** not make the contents of memory used by other subresources in the set undefined. An application **can** define the content of

a subresource of one image by performing device writes to an identical subresource of another image provided both images are bound to the same region of external memory. Applications **may** also add resources to such a set after the content of the existing set members has been defined without making the content undefined by creating a new image with the initial layout `VK_IMAGE_LAYOUT_UNDEFINED` and binding it to the same region of external memory as the existing images.

*Note*

Because layout transitions apply to all identical images aliasing the same region of external memory, the actual layout of the memory backing a new image as well as an existing image with defined content will not be undefined. Such an image is not usable until it acquires ownership of its memory from the existing owner. Therefore, the layout specified as part of this transition will be the true initial layout of the image. The undefined layout specified when creating it is a placeholder to simplify valid usage requirements.

## 11.8. Memory Aliasing

A range of a `VkDeviceMemory` allocation is *aliased* if it is bound to multiple resources simultaneously, as described below, via `vkBindImageMemory`, `vkBindBufferMemory`, via [sparse memory bindings](#), or by binding the memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms.

Consider two resources,  $\text{resource}_A$  and  $\text{resource}_B$ , bound respectively to memory range<sub>A</sub> and range<sub>B</sub>. Let paddedRange<sub>A</sub> and paddedRange<sub>B</sub> be, respectively, range<sub>A</sub> and range<sub>B</sub> aligned to [bufferImageGranularity](#). If the resources are both linear or both non-linear (as defined in the [Glossary](#)), then the resources *alias* the memory in the intersection of range<sub>A</sub> and range<sub>B</sub>. If one resource is linear and the other is non-linear, then the resources *alias* the memory in the intersection of paddedRange<sub>A</sub> and paddedRange<sub>B</sub>.

Applications **can** alias memory, but use of multiple aliases is subject to several constraints.

*Note*

Memory aliasing **can** be useful to reduce the total device memory footprint of an application, if some large resources are used for disjoint periods of time.

When a [non-linear](#), non-`VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` image is bound to an aliased range, all image subresources of the image *overlap* the range. When a linear image is bound to an aliased range, the image subresources that (according to the image's advertised layout) include bytes from the aliased range overlap the range. When a `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` image has sparse image blocks bound to an aliased range, only image subresources including those sparse image blocks overlap the range, and when the memory bound to the image's mip tail overlaps an aliased range all image subresources in the mip tail overlap the range.

Buffers, and linear image subresources in either the `VK_IMAGE_LAYOUT_PREINITIALIZED` or `VK_IMAGE_LAYOUT_GENERAL` layouts, are *host-accessible subresources*. That is, the host has a well-defined addressing scheme to interpret the contents, and thus the layout of the data in memory **can**

be consistently interpreted across aliases if each of those aliases is a host-accessible subresource. Non-linear images, and linear image subresources in other layouts, are not host-accessible.

If two aliases are both host-accessible, then they interpret the contents of the memory in consistent ways, and data written to one alias **can** be read by the other alias.

If two aliases are both images that were created with identical creation parameters, both were created with the `VK_IMAGE_CREATE_ALIAS_BIT` flag set, and both are bound identically to memory except for `VkBindImageMemoryDeviceGroupInfo::pDeviceIndices` and `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions`, then they interpret the contents of the memory in consistent ways, and data written to one alias **can** be read by the other alias.

Additionally, if an individual plane of a multi-planar image and a single-plane image alias the same memory, then they also interpret the contents of the memory in consistent ways under the same conditions, but with the following modifications:

- Both **must** have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag.
- The single-plane image **must** have a `VkFormat` that is **equivalent** to that of the multi-planar image's individual plane.
- The single-plane image and the individual plane of the multi-planar image **must** be bound identically to memory except for `VkBindImageMemoryDeviceGroupInfo::pDeviceIndices` and `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions`.
- The `width` and `height` of the single-plane image are derived from the multi-planar image's dimensions in the manner listed for `plane compatibility` for the aliased plane.
- If either image's `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then both images **must** be `linear`.
- All other creation parameters **must** be identical

Aliases created by binding the same memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms interpret the contents of the memory in consistent ways, and data written to one alias **can** be read by the other alias.

Otherwise, the aliases interpret the contents of the memory differently, and writes via one alias make the contents of memory partially or completely undefined to the other alias. If the first alias is a host-accessible subresource, then the bytes affected are those written by the memory operations according to its addressing scheme. If the first alias is not host-accessible, then the bytes affected are those overlapped by the image subresources that were written. If the second alias is a host-accessible subresource, the affected bytes become undefined. If the second alias is not host-accessible, all sparse image blocks (for sparse partially-resident images) or all image subresources (for non-sparse image and fully resident sparse images) that overlap the affected bytes become undefined.

If any image subresources are made undefined due to writes to an alias, then each of those image subresources **must** have its layout transitioned from `VK_IMAGE_LAYOUT_UNDEFINED` to a valid layout before it is used, or from `VK_IMAGE_LAYOUT_PREINITIALIZED` if the memory has been written by the host. If any sparse blocks of a sparse image have been made undefined, then only the image subresources containing them **must** be transitioned.

Use of an overlapping range by two aliases **must** be separated by a memory dependency using the appropriate [access types](#) if at least one of those uses performs writes, whether the aliases interpret memory consistently or not. If buffer or image memory barriers are used, the scope of the barrier **must** contain the entire range and/or set of image subresources that overlap.

If two aliasing image views are used in the same framebuffer, then the render pass **must** declare the attachments using the [VK\\_ATTACHMENT\\_DESCRIPTION\\_MAY\\_ALIAS\\_BIT](#), and follow the other rules listed in that section.

*Note*

Memory recycled via an application suballocator (i.e. without freeing and reallocating the memory objects) is not substantially different from memory aliasing. However, a suballocator usually waits on a fence before recycling a region of memory, and signaling a fence involves sufficient implicit dependencies to satisfy all the above requirements.

## 11.9. Acceleration Structures

Acceleration structures are an opaque structure that is built by the implementation to more efficiently perform spatial queries on the provided geometric data. For this extension, an acceleration structure is either a top-level acceleration structure containing a set of bottom-level acceleration structures or a bottom-level acceleration structure containing either a set of axis-aligned bounding boxes for custom geometry or a set of triangles.

Each instance in the top-level acceleration structure contains a reference to a bottom-level acceleration structure as well as an instance transform plus information required to index into the shader bindings. The top-level acceleration structure is what is bound to the acceleration descriptor to trace inside the shader in the ray tracing pipeline.

Acceleration structures are represented by [VkAccelerationStructureNV](#) handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkAccelerationStructureNV)
```

To create acceleration structures, call:

```
VkResult vkCreateAccelerationStructureNV(  
    VkDevice                                     device,  
    const VkAccelerationStructureCreateInfoNV* pCreateInfo,  
    const VkAllocationCallbacks*                 pAllocator,  
    VkAccelerationStructureNV*                  pAccelerationStructure);
```

- **device** is the logical device that creates the buffer object.
- **pCreateInfo** is a pointer to a [VkAccelerationStructureCreateInfoNV](#) structure containing parameters affecting creation of the acceleration structure.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.

- `pAccelerationStructure` is a pointer to a `VkAccelerationStructureNV` handle in which the resulting acceleration structure object is returned.

Similar to other objects in Vulkan, the acceleration structure creation merely creates an object with a specific “shape” as specified by the information in `VkAccelerationStructureCreateInfoNV` and `compactedSize` in `pCreateInfo`. Populating the data in the object after allocating and binding memory is done with `vkCmdBuildAccelerationStructureNV` and `vkCmdCopyAccelerationStructureNV`.

Acceleration structure creation uses the count and type information from the geometries, but does not use the data references in the structures.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkAccelerationStructureCreateInfoNV` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pAccelerationStructure` **must** be a valid pointer to a `VkAccelerationStructureNV` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkAccelerationStructureCreateInfoNV` structure is defined as:

```
typedef struct VkAccelerationStructureCreateInfoNV {
    VkStructureType           sType;
    const void*               pNext;
    VkDeviceSize              compactedSize;
    VkAccelerationStructureInfoNV info;
} VkAccelerationStructureCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `compactedSize` is the size from the result of `vkCmdWriteAccelerationStructuresPropertiesNV` if this acceleration structure is going to be the target of a compacting copy.
- `info` is the `VkAccelerationStructureInfoNV` structure specifying further parameters of the created acceleration structure.

## Valid Usage

- If `compactedSize` is not `0` then both `info.geometryCount` and `info.instanceCount` **must** be `0`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_NV`
- `pNext` **must** be `NULL`
- `info` **must** be a valid `VkAccelerationStructureCreateInfoNV` structure

The `VkAccelerationStructureCreateInfoNV` structure is defined as:

```
typedef struct VkAccelerationStructureCreateInfoNV {  
    VkStructureType sType;  
    const void* pNext;  
    VkAccelerationStructureTypeNV type;  
    VkBuildAccelerationStructureFlagsNV flags;  
    uint32_t instanceCount;  
    uint32_t geometryCount;  
    const VkGeometryNV* pGeometries;  
} VkAccelerationStructureCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `type` is a `VkAccelerationStructureTypeNV` value specifying the type of acceleration structure that will be created.
- `flags` is a bitmask of `VkBuildAccelerationStructureFlagBitsNV` specifying additional parameters of the acceleration structure.
- `instanceCount` specifies the number of instances that will be in the new acceleration structure.
- `geometryCount` specifies the number of geometries that will be in the new acceleration structure.
- `pGeometries` is a pointer to an array of `geometryCount` `VkGeometryNV` structures containing the scene data being passed into the acceleration structure.

`VkAccelerationStructureCreateInfoNV` contains information that is used both for acceleration structure creation with `vkCreateAccelerationStructureNV` and in combination with the actual geometric data to build the acceleration structure with `vkCmdBuildAccelerationStructureNV`.

## Valid Usage

- `geometryCount` **must** be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxGeometryCount`
- `instanceCount` **must** be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxInstanceCount`
- The total number of triangles in all geometries **must** be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxTriangleCount`
- If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_NV` then `geometryCount` **must** be `0`
- If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV` then `instanceCount` **must** be `0`
- If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV` then the `geometryType` member of each geometry in `pGeometries` **must** be the same
- If `flags` has the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_NV` bit set, then it **must** not have the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_NV` bit set
- `scratch` **must** have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag
- If `instanceData` is not `VK_NULL_HANDLE`, `instanceData` **must** have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_INFO_NV`
- `pNext` **must** be `NULL`
- `type` **must** be a valid `VkAccelerationStructureTypeNV` value
- `flags` **must** be a valid combination of `VkBuildAccelerationStructureFlagBitsNV` values
- If `geometryCount` is not `0`, `pGeometries` **must** be a valid pointer to an array of `geometryCount` valid `VkGeometryNV` structures

Values which **can** be set in `VkAccelerationStructureInfoNV::type`, specifying the type of acceleration structure, are:

```
typedef enum VkAccelerationStructureTypeNV {
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_NV = 0,
    VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV = 1,
    VK_ACCELERATION_STRUCTURE_TYPE_MAX_ENUM_NV = 0x7FFFFFFF
} VkAccelerationStructureTypeNV;
```

- `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_NV` is a top-level acceleration structure containing instance data referring to bottom-level level acceleration structures.
- `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV` is a bottom-level acceleration structure containing the AABBs or geometry to be intersected.

Bits which **can** be set in `VkAccelerationStructureInfoNV::flags`, specifying additional parameters for acceleration structure builds, are:

```
typedef enum VkBuildAccelerationStructureFlagBitsNV {
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_NV = 0x00000001,
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_NV = 0x00000002,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_NV = 0x00000004,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_NV = 0x00000008,
    VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_NV = 0x00000010,
    VK_BUILD_ACCELERATION_STRUCTURE_FLAG_BITS_MAX_ENUM_NV = 0x7FFFFFFF
} VkBuildAccelerationStructureFlagBitsNV;
```

- `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_NV` indicates that the specified acceleration structure **can** be updated with `update` of `VK_TRUE` in `vkCmdBuildAccelerationStructureNV`.
- `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_NV` indicates that the specified acceleration structure **can** act as the source for `vkCmdCopyAccelerationStructureNV` with `mode` of `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_NV` to produce a compacted acceleration structure.
- `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_NV` indicates that the given acceleration structure build **should** prioritize trace performance over build time.
- `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_NV` indicates that the given acceleration structure build **should** prioritize build time over trace performance.
- `VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_NV` indicates that this acceleration structure **should** minimize the size of the scratch memory and the final result build, potentially at the expense of build time or trace performance.

*Note*

`VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_NV` and `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_NV` **may** take more time and memory than a normal build, and so **should** only be used when those features are used.

```
typedef VkFlags VkBuildAccelerationStructureFlagsNV;
```

`VkBuildAccelerationStructureFlagsNV` is a bitmask type for setting a mask of zero or more `VkBuildAccelerationStructureFlagBitsNV`.

The `VkGeometryNV` structure is defined as:

```

typedef struct VkGeometryNV {
    VkStructureType      sType;
    const void*        pNext;
    VkGeometryTypeNV    geometryType;
    VkGeometryDataNV    geometry;
    VkGeometryFlagsNV   flags;
} VkGeometryNV;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **geometryType** describes which type of geometry this **VkGeometryNV** refers to.
- **geometry** contains the geometry data as described in **VkGeometryDataNV**.
- **flags** has flags describing options for this geometry.

## Valid Usage (Implicit)

- **sType** **must** be **VK\_STRUCTURE\_TYPE\_GEOMETRY\_NV**
- **pNext** **must** be **NULL**
- **geometryType** **must** be a valid **VkGeometryTypeNV** value
- **geometry** **must** be a valid **VkGeometryDataNV** structure
- **flags** **must** be a valid combination of **VkGeometryFlagBitsNV** values

Geometry types are specified by **VkGeometryTypeNV**, which takes values:

```

typedef enum VkGeometryTypeNV {
    VK_GEOMETRY_TYPE_TRIANGLES_NV = 0,
    VK_GEOMETRY_TYPE_AABBS_NV = 1,
    VK_GEOMETRY_TYPE_MAX_ENUM_NV = 0x7FFFFFFF
} VkGeometryTypeNV;

```

- **VK\_GEOMETRY\_TYPE\_TRIANGLES\_NV** indicates that the **triangles** of **VkGeometryDataNV** contains valid data.
- **VK\_GEOMETRY\_TYPE\_AABBS\_NV** indicates that the **aabbs** of **VkGeometryDataNV** contains valid data.

Bits which **can** be set in **VkGeometryNV::flags**, specifying additional parameters for acceleration structure builds, are:

```
typedef enum VkGeometryFlagBitsNV {
    VK_GEOMETRY_OPAQUE_BIT_NV = 0x00000001,
    VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_NV = 0x00000002,
    VK_GEOMETRY_FLAG_BITS_MAX_ENUM_NV = 0x7FFFFFFF
} VkGeometryFlagBitsNV;
```

- `VK_GEOMETRY_OPAQUE_BIT_NV` indicates that this geometry does not invoke the any-hit shaders even if present in a hit group.
- `VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_NV` indicates that the implementation **must** only call the any-hit shader a single time for each primitive in this geometry. If this bit is absent an implementation **may** invoke the any-hit shader more than once for this geometry.

```
typedef VkFlags VkGeometryFlagsNV;
```

`VkGeometryFlagsNV` is a bitmask type for setting a mask of zero or more `VkGeometryFlagBitsNV`.

The `VkGeometryDataNV` structure is defined as:

```
typedef struct VkGeometryDataNV {
    VkGeometryTrianglesNV    triangles;
    VkGeometryAABBNV        aabbs;
} VkGeometryDataNV;
```

- `triangles` contains triangle data if `VkGeometryNV::geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_NV`.
- `aabbs` contains axis-aligned bounding box data if `VkGeometryNV::geometryType` is `VK_GEOMETRY_TYPE_AABBS_NV`.

### Valid Usage (Implicit)

- `triangles` **must** be a valid `VkGeometryTrianglesNV` structure
- `aabbs` **must** be a valid `VkGeometryAABBNV` structure

The `VkGeometryTrianglesNV` structure is defined as:

```

typedef struct VkGeometryTrianglesNV {
    VkStructureType      sType;
    const void*        pNext;
    VkBuffer            vertexData;
    VkDeviceSize         vertexOffset;
    uint32_t             vertexCount;
    VkDeviceSize         vertexStride;
    VkFormat             vertexFormat;
    VkBuffer            indexData;
    VkDeviceSize         indexOffset;
    uint32_t             indexCount;
    VkIndexType          indexType;
    VkBuffer            transformData;
    VkDeviceSize         transformOffset;
} VkGeometryTrianglesNV;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **vertexData** is the buffer containing vertex data for this geometry.
- **vertexOffset** is the offset in bytes within **vertexData** containing vertex data for this geometry.
- **vertexCount** is the number of valid vertices.
- **vertexStride** is the stride in bytes between each vertex.
- **vertexFormat** is the format of each vertex element.
- **indexData** is the buffer containing index data for this geometry.
- **indexOffset** is the offset in bytes within **indexData** containing index data for this geometry.
- **indexCount** is the number of indices to include in this geometry.
- **indexType** is the format of each index.
- **transformData** is a buffer containing optional reference to an array of 32-bit floats representing a 3x4 row major affine transformation matrix for this geometry.
- **transformOffset** is the offset in bytes in **transformData** of the transform information described above.

If **indexType** is **VK\_INDEX\_TYPE\_NONE\_NV**, then this structure describes a set of triangles determined by **vertexCount**. Otherwise, this structure describes a set of indexed triangles determined by **indexCount**.

## Valid Usage

- `vertexOffset` **must** be less than the size of `vertexData`
- `vertexOffset` **must** be a multiple of the component size of `vertexFormat`
- `vertexFormat` **must** be one of `VK_FORMAT_R32G32B32_SFLOAT`, `VK_FORMAT_R32G32_SFLOAT`, `VK_FORMAT_R16G16B16_SFLOAT`, `VK_FORMAT_R16G16_SFLOAT`, `VK_FORMAT_R16G16_SNORM`, or `VK_FORMAT_R16G16B16_SNORM`
- `indexOffset` **must** be less than the size of `indexData`
- `indexOffset` **must** be a multiple of the element size of `indexType`
- `indexType` **must** be `VK_INDEX_TYPE_UINT16`, `VK_INDEX_TYPE_UINT32`, or `VK_INDEX_TYPE_NONE_NV`
- `indexData` **must** be `VK_NULL_HANDLE` if `indexType` is `VK_INDEX_TYPE_NONE_NV`
- `indexData` **must** be a valid `VkBuffer` handle if `indexType` is not `VK_INDEX_TYPE_NONE_NV`
- `indexCount` **must** be `0` if `indexType` is `VK_INDEX_TYPE_NONE_NV`
- `transformOffset` **must** be less than the size of `transformData`
- `transformOffset` **must** be a multiple of `16`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_GEOMETRY_TRIANGLES_NV`
- `pNext` **must** be `NULL`
- If `vertexData` is not `VK_NULL_HANDLE`, `vertexData` **must** be a valid `VkBuffer` handle
- `vertexFormat` **must** be a valid `VkFormat` value
- If `indexData` is not `VK_NULL_HANDLE`, `indexData` **must** be a valid `VkBuffer` handle
- `indexType` **must** be a valid `VkIndexType` value
- If `transformData` is not `VK_NULL_HANDLE`, `transformData` **must** be a valid `VkBuffer` handle
- Each of `indexData`, `transformData`, and `vertexData` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

The `VkGeometryAABBNV` structure is defined as:

```
typedef struct VkGeometryAABBNV {
    VkStructureType    sType;
    const void*        pNext;
    VkBuffer           aabbData;
    uint32_t           numAABBS;
    uint32_t           stride;
    VkDeviceSize        offset;
} VkGeometryAABBNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `aabbData` is the buffer containing axis-aligned bounding box data.
- `numAABBs` is the number of AABBs in this geometry.
- `stride` is the stride in bytes between AABBs in `aabbData`.
- `offset` is the offset in bytes of the first AABB in `aabbData`.

The AABB data in memory is six 32-bit floats consisting of the minimum x, y, and z values followed by the maximum x, y, and z values.

## Valid Usage

- `offset` **must** be less than the size of `aabbData`
- `offset` **must** be a multiple of 8
- `stride` **must** be a multiple of 8

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_GEOMETRY_AABB_NV`
- `pNext` **must** be `NULL`
- If `aabbData` is not `VK_NULL_HANDLE`, `aabbData` **must** be a valid `VkBuffer` handle

To destroy an acceleration structure, call:

```
void vkDestroyAccelerationStructureNV(
    VkDevice                                     device,
    VkAccelerationStructureNV                    accelerationStructure,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the buffer.
- `accelerationStructure` is the acceleration structure to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- All submitted commands that refer to `accelerationStructure` **must** have completed execution
- If `VkAllocationCallbacks` were provided when `accelerationStructure` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `accelerationStructure` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `accelerationStructure` **must** be a valid `VkAccelerationStructureNV` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `accelerationStructure` **must** have been created, allocated, or retrieved from `device`

An acceleration structure has memory requirements for the structure object itself, scratch space for the build, and scratch space for the update.

To query the memory requirements call:

```
void vkGetAccelerationStructureMemoryRequirementsNV(  
    VkDevice                               device,  
    const VkAccelerationStructureMemoryRequirementsInfoNV* pInfo,  
    VkMemoryRequirements2KHR*               pMemoryRequirements);
```

- `device` is the logical device on which the acceleration structure was created.
- `pInfo` specifies the acceleration structure to get memory requirements for.
- `pMemoryRequirements` returns the requested acceleration structure memory requirements.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pInfo` **must** be a valid pointer to a valid `VkAccelerationStructureMemoryRequirementsInfoNV` structure
- `pMemoryRequirements` **must** be a valid pointer to a `VkMemoryRequirements2KHR` structure

The `VkAccelerationStructureMemoryRequirementsInfoNV` structure is defined as:

```

typedef struct VkAccelerationStructureMemoryRequirementsInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureMemoryRequirementsTypeNV type;
    VkAccelerationStructureNV accelerationStructure;
} VkAccelerationStructureMemoryRequirementsInfoNV;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **type** selects the type of memory requirement being queried.
  - VK\_ACCELERATION\_STRUCTURE\_MEMORY\_REQUIREMENTS\_TYPE\_OBJECT\_NV** returns the memory requirements for the object itself.
  - VK\_ACCELERATION\_STRUCTURE\_MEMORY\_REQUIREMENTS\_TYPE\_BUILD\_SCRATCH\_NV** returns the memory requirements for the scratch memory when doing a build.
  - VK\_ACCELERATION\_STRUCTURE\_MEMORY\_REQUIREMENTS\_TYPE\_UPDATE\_SCRATCH\_NV** returns the memory requirements for the scratch memory when doing an update.
- **accelerationStructure** is the acceleration structure to be queried for memory requirements.

## Valid Usage (Implicit)

- **sType** **must** be **VK\_STRUCTURE\_TYPE\_ACCELERATION\_STRUCTURE\_MEMORY\_REQUIREMENTS\_INFO\_NV**
- **pNext** **must** be **NULL**
- **type** **must** be a valid **VkAccelerationStructureMemoryRequirementsTypeNV** value
- **accelerationStructure** **must** be a valid **VkAccelerationStructureNV** handle

Possible values of **type** in **VkAccelerationStructureMemoryRequirementsInfoNV** are:

```

typedef enum VkAccelerationStructureMemoryRequirementsTypeNV {
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV = 0,
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV = 1,
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV = 2,
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_MAX_ENUM_NV = 0x7FFFFFFF
} VkAccelerationStructureMemoryRequirementsTypeNV;

```

- **VK\_ACCELERATION\_STRUCTURE\_MEMORY\_REQUIREMENTS\_TYPE\_OBJECT\_NV** requests the memory requirement for the **VkAccelerationStructureNV** backing store.
- **VK\_ACCELERATION\_STRUCTURE\_MEMORY\_REQUIREMENTS\_TYPE\_BUILD\_SCRATCH\_NV** requests the memory requirement for scratch space during the initial build.
- **VK\_ACCELERATION\_STRUCTURE\_MEMORY\_REQUIREMENTS\_TYPE\_UPDATE\_SCRATCH\_NV** requests the memory requirement for scratch space during an update.

To attach memory to one or more acceleration structures at a time, call:

```
VkResult vkBindAccelerationStructureMemoryNV(  
    VkDevice device,  
    uint32_t bindInfoCount,  
    const VkBindAccelerationStructureMemoryInfoNV* pBindInfos);
```

- `device` is the logical device that owns the acceleration structures and memory.
- `bindInfoCount` is the number of elements in `pBindInfos`.
- `pBindInfos` is a pointer to an array of `VkBindAccelerationStructureMemoryInfoNV` structures describing images and memory to bind.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pBindInfos` **must** be a valid pointer to an array of `bindInfoCount` valid `VkBindAccelerationStructureMemoryInfoNV` structures
- `bindInfoCount` **must** be greater than 0

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkBindAccelerationStructureMemoryInfoNV` structure is defined as:

```
typedef struct VkBindAccelerationStructureMemoryInfoNV {  
    VkStructureType sType;  
    const void* pNext;  
    VkAccelerationStructureNV accelerationStructure;  
    VkDeviceMemory memory;  
    VkDeviceSize memoryOffset;  
    uint32_t deviceIndexCount;  
    const uint32_t* pDeviceIndices;  
} VkBindAccelerationStructureMemoryInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `accelerationStructure` is the acceleration structure to be attached to memory.
- `memory` is a `VkDeviceMemory` object describing the device memory to attach.

- `memoryOffset` is the start offset of the region of memory that is to be bound to the acceleration structure. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified acceleration structure.
- `deviceIndexCount` is the number of elements in `pDeviceIndices`.
- `pDeviceIndices` is a pointer to an array of device indices.

## Valid Usage

- `accelerationStructure` **must** not already be backed by a memory object
- `memoryOffset` **must** be less than the size of `memory`
- `memory` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `accelerationStructure` and `type` of `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV`
- `memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `accelerationStructure` and `type` of `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV`
- The `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `accelerationStructure` and `type` of `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV` **must** be less than or equal to the size of `memory` minus `memoryOffset`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_BIND_ACCELERATION_STRUCTURE_MEMORY_INFO_NV`
- `pNext` **must** be `NULL`
- `accelerationStructure` **must** be a valid `VkAccelerationStructureNV` handle
- `memory` **must** be a valid `VkDeviceMemory` handle
- If `deviceIndexCount` is not `0`, `pDeviceIndices` **must** be a valid pointer to an array of `deviceIndexCount` `uint32_t` values
- Both of `accelerationStructure`, and `memory` **must** have been created, allocated, or retrieved from the same `VkDevice`

To allow constructing geometry instances with device code if desired, we need to be able to query a opaque handle for an acceleration structure. This handle is a value of 8 bytes. To get this handle, call:

```
VkResult vkGetAccelerationStructureHandleNV(  
    VkDevice device,  
    VkAccelerationStructureNV accelerationStructure,  
    size_t dataSize,  
    void* pData);
```

- `device` is the logical device that owns the acceleration structures.
- `accelerationStructure` is the acceleration structure.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to a user-allocated buffer where the results will be written.

## Valid Usage

- `dataSize` **must** be large enough to contain the result of the query, as described above
- `accelerationStructure` **must** be bound completely and contiguously to a single `VkDeviceMemory` object via `vkBindAccelerationStructureMemoryNV`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `accelerationStructure` **must** be a valid `VkAccelerationStructureNV` handle
- `pData` **must** be a valid pointer to an array of `dataSize` bytes
- `dataSize` **must** be greater than `0`
- `accelerationStructure` **must** have been created, allocated, or retrieved from `device`

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

# Chapter 12. Samplers

`VkSampler` objects represent the state of an image sampler which is used by the implementation to read image data and apply filtering and other transformations for the shader.

Samplers are represented by `VkSampler` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSampler)
```

To create a sampler object, call:

```
VkResult vkCreateSampler(  
    VkDevice device,  
    const VkSamplerCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkSampler* pSampler);
```

- `device` is the logical device that creates the sampler.
- `pCreateInfo` is a pointer to a `VkSamplerCreateInfo` structure specifying the state of the sampler object.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pSampler` is a pointer to a `VkSampler` handle in which the resulting sampler object is returned.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkSamplerCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pSampler` **must** be a valid pointer to a `VkSampler` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_TOO_MANY_OBJECTS`

The `VkSamplerCreateInfo` structure is defined as:

```

typedef struct VkSamplerCreateInfo {
    VkStructureType      sType;
    const void*        pNext;
    VkSamplerCreateFlags flags;
    VkFilter             magFilter;
    VkFilter             minFilter;
    VkSamplerMipmapMode mipmapMode;
    VkSamplerAddressMode addressModeU;
    VkSamplerAddressMode addressModeV;
    VkSamplerAddressMode addressModeW;
    float              mipLodBias;
    VkBool32             anisotropyEnable;
    float              maxAnisotropy;
    VkBool32             compareEnable;
    VkCompareOp          compareOp;
    float              minLod;
    float              maxLod;
    VkBorderColor         borderColor;
    VkBool32             unnormalizedCoordinates;
} VkSamplerCreateInfo;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **flags** is a bitmask of **VkSamplerCreateFlagBits** describing additional parameters of the sampler.
- **magFilter** is a **VkFilter** value specifying the magnification filter to apply to lookups.
- **minFilter** is a **VkFilter** value specifying the minification filter to apply to lookups.
- **mipmapMode** is a **VkSamplerMipmapMode** value specifying the mipmap filter to apply to lookups.
- **addressModeU** is a **VkSamplerAddressMode** value specifying the addressing mode for outside [0..1] range for U coordinate.
- **addressModeV** is a **VkSamplerAddressMode** value specifying the addressing mode for outside [0..1] range for V coordinate.
- **addressModeW** is a **VkSamplerAddressMode** value specifying the addressing mode for outside [0..1] range for W coordinate.
- **mipLodBias** is the bias to be added to mipmap LOD (level-of-detail) calculation and bias provided by image sampling functions in SPIR-V, as described in the [Level-of-Detail Operation](#) section.
- **anisotropyEnable** is **VK\_TRUE** to enable anisotropic filtering, as described in the [Texel Anisotropic Filtering](#) section, or **VK\_FALSE** otherwise.
- **maxAnisotropy** is the anisotropy value clamp used by the sampler when **anisotropyEnable** is **VK\_TRUE**. If **anisotropyEnable** is **VK\_FALSE**, **maxAnisotropy** is ignored.
- **compareEnable** is **VK\_TRUE** to enable comparison against a reference value during lookups, or **VK\_FALSE** otherwise.
  - Note: Some implementations will default to shader state if this member does not match.

- `compareOp` is a [VkCompareOp](#) value specifying the comparison function to apply to fetched data before filtering as described in the [Depth Compare Operation](#) section.
- `minLod` and `maxLod` are the values used to clamp the computed LOD value, as described in the [Level-of-Detail Operation](#) section.
- `borderColor` is a [VkBorderColor](#) value specifying the predefined border color to use.
- `unnormalizedCoordinates` controls whether to use unnormalized or normalized texel coordinates to address texels of the image. When set to `VK_TRUE`, the range of the image coordinates used to lookup the texel is in the range of zero to the image dimensions for x, y and z. When set to `VK_FALSE` the range of image coordinates is zero to one.

When `unnormalizedCoordinates` is `VK_TRUE`, images the sampler is used with in the shader have the following requirements:

- The `viewType` **must** be either `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`.
- The image view **must** have a single layer and a single mip level.

When `unnormalizedCoordinates` is `VK_TRUE`, image built-in functions in the shader that use the sampler have the following requirements:

- The functions **must** not use projection.
- The functions **must** not use offsets.

#### *Mapping of OpenGL to Vulkan filter modes*

`magFilter` values of `VK_FILTER_NEAREST` and `VK_FILTER_LINEAR` directly correspond to `GL_NEAREST` and `GL_LINEAR` magnification filters. `minFilter` and `mipmapMode` combine to correspond to the similarly named OpenGL minification filter of `GL_minFilter_MIPMAP_mipmapMode` (e.g. `minFilter` of `VK_FILTER_LINEAR` and `mipmapMode` of `VK_SAMPLER_MIPMAP_MODE_NEAREST` correspond to `GL_LINEAR_MIPMAP_NEAREST`).

There are no Vulkan filter modes that directly correspond to OpenGL minification filters of `GL_LINEAR` or `GL_NEAREST`, but they **can** be emulated using `VK_SAMPLER_MIPMAP_MODE_NEAREST`, `minLod` = 0, and `maxLod` = 0.25, and using `minFilter` = `VK_FILTER_LINEAR` or `minFilter` = `VK_FILTER_NEAREST`, respectively.

Note that using a `maxLod` of zero would cause [magnification](#) to always be performed, and the `magFilter` to always be used. This is valid, just not an exact match for OpenGL behavior. Clamping the maximum LOD to 0.25 allows the  $\lambda$  value to be non-zero and minification to be performed, while still always rounding down to the base level. If the `minFilter` and `magFilter` are equal, then using a `maxLod` of zero also works.

The maximum number of sampler objects which **can** be simultaneously created on a device is implementation-dependent and specified by the `maxSamplerAllocationCount` member of the [VkPhysicalDeviceLimits](#) structure. If `maxSamplerAllocationCount` is exceeded, `vkCreateSampler` will return `VK_ERROR_TOO_MANY_OBJECTS`.

Since [VkSampler](#) is a non-dispatchable handle type, implementations **may** return the same handle

for sampler state vectors that are identical. In such cases, all such objects would only count once against the `maxSamplerAllocationCount` limit.

## Valid Usage

- The absolute value of `mipLodBias` **must** be less than or equal to `VkPhysicalDeviceLimits::maxSamplerLodBias`
- `maxLod` **must** be greater than or equal to `minLod`
- If the `anisotropic sampling` feature is not enabled, `anisotropyEnable` **must** be `VK_FALSE`
- If `anisotropyEnable` is `VK_TRUE`, `maxAnisotropy` **must** be between `1.0` and `VkPhysicalDeviceLimits::maxSamplerAnisotropy`, inclusive
- If `sampler Y'CBCR conversion` is enabled and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT` is not set for the format, `minFilter` and `magFilter` **must** be equal to the sampler `Y'CBCR conversion`'s `chromaFilter`
- If `unnormalizedCoordinates` is `VK_TRUE`, `minFilter` and `magFilter` **must** be equal
- If `unnormalizedCoordinates` is `VK_TRUE`, `mipmapMode` **must** be `VK_SAMPLER_MIPMAP_MODE_NEAREST`
- If `unnormalizedCoordinates` is `VK_TRUE`, `minLod` and `maxLod` **must** be zero
- If `unnormalizedCoordinates` is `VK_TRUE`, `addressModeU` and `addressModeV` **must** each be either `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` or `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`
- If `unnormalizedCoordinates` is `VK_TRUE`, `anisotropyEnable` **must** be `VK_FALSE`
- If `unnormalizedCoordinates` is `VK_TRUE`, `compareEnable` **must** be `VK_FALSE`
- If any of `addressModeU`, `addressModeV` or `addressModeW` are `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`, `borderColor` **must** be a valid `VkBorderColor` value
- If `sampler Y'CBCR conversion` is enabled, `addressModeU`, `addressModeV`, and `addressModeW` **must** be `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`, `anisotropyEnable` **must** be `VK_FALSE`, and `unnormalizedCoordinates` **must** be `VK_FALSE`
- The sampler reduction mode **must** be set to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_EXT` if sampler `Y'CBCR conversion` is enabled
- If the `VK_KHR_sampler_mirror_clamp_to_edge` extension is not enabled, `addressModeU`, `addressModeV` and `addressModeW` **must** not be `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE`
- If `compareEnable` is `VK_TRUE`, `compareOp` **must** be a valid `VkCompareOp` value
- If either `magFilter` or `minFilter` is `VK_FILTER_CUBIC_EXT`, `anisotropyEnable` **must** be `VK_FALSE`
- If `compareEnable` is `VK_TRUE`, the `reductionMode` member of `VkSamplerReductionModeCreateInfoEXT` **must** be `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_EXT`
- If `flags` includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `minFilter` and `magFilter` **must** be equal.
- If `flags` includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `mipmapMode` **must** be `VK_SAMPLER_MIPMAP_MODE_NEAREST`.
- If `flags` includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `minLod` and `maxLod` **must** be zero.

- If `flags` includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `addressModeU` and `addressModeV` **must** each be either `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` or `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`.
- If `flags` includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `anisotropyEnable` **must** be `VK_FALSE`.
- If `flags` includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `compareEnable` **must** be `VK_FALSE`.
- If `flags` includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `unnormalizedCoordinates` **must** be `VK_FALSE`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkSamplerReductionModeCreateInfoEXT` or `VkSamplerYcbcrConversionInfo`
- Each `sType` member in the `pNext` chain **must** be unique
- `flags` **must** be a valid combination of `VkSamplerCreateFlagBits` values
- `magFilter` **must** be a valid `VkFilter` value
- `minFilter` **must** be a valid `VkFilter` value
- `mipmapMode` **must** be a valid `VkSamplerMipmapMode` value
- `addressModeU` **must** be a valid `VkSamplerAddressMode` value
- `addressModeV` **must** be a valid `VkSamplerAddressMode` value
- `addressModeW` **must** be a valid `VkSamplerAddressMode` value

Bits which **can** be set in `VkSamplerCreateInfo::flags`, specifying additional parameters of a sampler, are:

```
typedef enum VkSamplerCreateFlagBits {
    VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT = 0x00000001,
    VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT = 0x00000002,
    VK_SAMPLER_CREATE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkSamplerCreateFlagBits;
```

- `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` specifies that the sampler will read from an image created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.
- `VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT` specifies that the implementation **may** use approximations when reconstructing a full color value for texture access from a subsampled image.

*Note*

The approximations used when `VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT` is specified are implementation defined. Some implementations **may** interpolate between fragment density levels in a subsampled image. In that case, this bit **may** be used to decide whether the interpolation factors are calculated per fragment or at a coarser granularity.

```
typedef VkFlags VkSamplerCreateFlags;
```

`VkSamplerCreateFlags` is a bitmask type for setting a mask of zero or more `VkSamplerCreateFlagBits`.

If the `pNext` chain of `VkSamplerCreateInfo` includes a `VkSamplerReductionModeCreateInfoEXT` structure, then that structure includes a mode that controls how texture filtering combines texel values.

The `VkSamplerReductionModeCreateInfoEXT` structure is defined as:

```
typedef struct VkSamplerReductionModeCreateInfoEXT {
    VkStructureType          sType;
    const void*              pNext;
    VkSamplerReductionModeEXT reductionMode;
} VkSamplerReductionModeCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `reductionMode` is a `VkSamplerReductionModeEXT` value controlling how texture filtering combines texel values.

If this structure is not present, `reductionMode` is considered to be `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_EXT`.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_SAMPLER_REDUCTION_MODE_CREATE_INFO_EXT`
- `reductionMode` **must** be a valid `VkSamplerReductionModeEXT` value

Reduction modes are specified by `VkSamplerReductionModeEXT`, which takes values:

```
typedef enum VkSamplerReductionModeEXT {
    VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_EXT = 0,
    VK_SAMPLER_REDUCTION_MODE_MIN_EXT = 1,
    VK_SAMPLER_REDUCTION_MODE_MAX_EXT = 2,
    VK_SAMPLER_REDUCTION_MODE_MAX_ENUM_EXT = 0x7FFFFFFF
} VkSamplerReductionModeEXT;
```

- `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_EXT` specifies that texel values are combined by computing a weighted average of values in the footprint, using weights as specified in [the image operations chapter](#).
- `VK_SAMPLER_REDUCTION_MODE_MIN_EXT` specifies that texel values are combined by taking the component-wise minimum of values in the footprint with non-zero weights.
- `VK_SAMPLER_REDUCTION_MODE_MAX_EXT` specifies that texel values are combined by taking the component-wise maximum of values in the footprint with non-zero weights.

Possible values of the `VkSamplerCreateInfo::magFilter` and `minFilter` parameters, specifying filters used for texture lookups, are:

```
typedef enum VkFilter {
    VK_FILTER_NEAREST = 0,
    VK_FILTER_LINEAR = 1,
    VK_FILTER_CUBIC_IMG = 1000015000,
    VK_FILTER_CUBIC_EXT = VK_FILTER_CUBIC_IMG,
    VK_FILTER_MAX_ENUM = 0x7FFFFFFF
} VkFilter;
```

- `VK_FILTER_NEAREST` specifies nearest filtering.
- `VK_FILTER_LINEAR` specifies linear filtering.
- `VK_FILTER_CUBIC_EXT` specifies cubic filtering.

These filters are described in detail in [Texel Filtering](#).

Possible values of the `VkSamplerCreateInfo::mipmapMode`, specifying the mipmap mode used for texture lookups, are:

```
typedef enum VkSamplerMipmapMode {
    VK_SAMPLER_MIPMAP_MODE_NEAREST = 0,
    VK_SAMPLER_MIPMAP_MODE_LINEAR = 1,
    VK_SAMPLER_MIPMAP_MODE_MAX_ENUM = 0x7FFFFFFF
} VkSamplerMipmapMode;
```

- `VK_SAMPLER_MIPMAP_MODE_NEAREST` specifies nearest filtering.
- `VK_SAMPLER_MIPMAP_MODE_LINEAR` specifies linear filtering.

These modes are described in detail in [Texel Filtering](#).

Possible values of the `VkSamplerCreateInfo::addressMode`\* parameters, specifying the behavior of sampling with coordinates outside the range [0,1] for the respective u, v, or w coordinate as defined in the [Wrapping Operation](#) section, are:

```
typedef enum VkSamplerAddressMode {
    VK_SAMPLER_ADDRESS_MODE_REPEAT = 0,
    VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT = 1,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE = 2,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER = 3,
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE = 4,
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE_KHR =
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE,
    VK_SAMPLER_ADDRESS_MODE_MAX_ENUM = 0x7FFFFFFF
} VkSamplerAddressMode;
```

- `VK_SAMPLER_ADDRESS_MODE_REPEAT` specifies that the repeat wrap mode will be used.
- `VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT` specifies that the mirrored repeat wrap mode will be used.
- `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` specifies that the clamp to edge wrap mode will be used.
- `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER` specifies that the clamp to border wrap mode will be used.
- `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` specifies that the mirror clamp to edge wrap mode will be used. This is only valid if the `VK_KHR_sampler_mirror_clamp_to_edge` extension is enabled.

Possible values of `VkSamplerCreateInfo::borderColor`, specifying the border color used for texture lookups, are:

```
typedef enum VkBorderColor {
    VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK = 0,
    VK_BORDER_COLOR_INT_TRANSPARENT_BLACK = 1,
    VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK = 2,
    VK_BORDER_COLOR_INT_OPAQUE_BLACK = 3,
    VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE = 4,
    VK_BORDER_COLOR_INT_OPAQUE_WHITE = 5,
    VK_BORDER_COLOR_MAX_ENUM = 0x7FFFFFFF
} VkBorderColor;
```

- `VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK` specifies a transparent, floating-point format, black color.
- `VK_BORDER_COLOR_INT_TRANSPARENT_BLACK` specifies a transparent, integer format, black color.
- `VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK` specifies an opaque, floating-point format, black color.
- `VK_BORDER_COLOR_INT_OPAQUE_BLACK` specifies an opaque, integer format, black color.
- `VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE` specifies an opaque, floating-point format, white color.

- `VK_BORDER_COLOR_INT_OPAQUE_WHITE` specifies an opaque, integer format, white color.

These colors are described in detail in [Texel Replacement](#).

To destroy a sampler, call:

```
void vkDestroySampler(
    VkDevice                               device,
    VkSampler                             sampler,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the sampler.
- `sampler` is the sampler to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- All submitted commands that refer to `sampler` **must** have completed execution
- If `VkAllocationCallbacks` were provided when `sampler` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `sampler` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `sampler` is not `VK_NULL_HANDLE`, `sampler` **must** be a valid `VkSampler` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `sampler` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `sampler` **must** be externally synchronized

## 12.1. Sampler Y'CbCr conversion

To create a sampler with Y'CbCr conversion enabled, add a `VkSamplerYcbcrConversionInfo` to the `pNext` chain of the `VkSamplerCreateInfo` structure. To create a sampler Y'CbCr conversion, the `samplerYcbcrConversion` feature **must** be enabled. Conversion **must** be fixed at pipeline creation time, through use of a combined image sampler with an immutable sampler in

## `VkDescriptorSetLayoutBinding`.

A `VkSamplerYcbcrConversionInfo` **must** be provided for samplers to be used with image views that access `VK_IMAGE_ASPECT_COLOR_BIT` if the format appears in [Formats requiring sampler Y'CbCr conversion for VK\\_IMAGE\\_ASPECT\\_COLOR\\_BIT image views](#), or if the image view has an [external format](#).

The `VkSamplerYcbcrConversionInfo` structure is defined as:

```
typedef struct VkSamplerYcbcrConversionInfo {
    VkStructureType         sType;
    const void*             pNext;
    VkSamplerYcbcrConversion conversion;
} VkSamplerYcbcrConversionInfo;
```

or the equivalent

```
typedef VkSamplerYcbcrConversionInfo VkSamplerYcbcrConversionInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `conversion` is a `VkSamplerYcbcrConversion` handle created with `vkCreateSamplerYcbcrConversion`.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_INFO`
- `conversion` **must** be a valid `VkSamplerYcbcrConversion` handle

A sampler Y'CbCr conversion is an opaque representation of a device-specific sampler Y'CbCr conversion description, represented as a `VkSamplerYcbcrConversion` handle:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSamplerYcbcrConversion)
```

or the equivalent

```
typedef VkSamplerYcbcrConversion VkSamplerYcbcrConversionKHR;
```

To create a `VkSamplerYcbcrConversion`, call:

```
VkResult vkCreateSamplerYcbcrConversion(
    VkDevice device,
    const VkSamplerYcbcrConversionCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSamplerYcbcrConversion* pYcbcrConversion);
```

or the equivalent command

```
VkResult vkCreateSamplerYcbcrConversionKHR(
    VkDevice device,
    const VkSamplerYcbcrConversionCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSamplerYcbcrConversion* pYcbcrConversion);
```

- **device** is the logical device that creates the sampler Y'CbCr conversion.
- **pCreateInfo** is a pointer to a `VkSamplerYcbcrConversionCreateInfo` structure specifying the requested sampler Y'CbCr conversion.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pYcbcrConversion** is a pointer to a `VkSamplerYcbcrConversion` handle in which the resulting sampler Y'CbCr conversion is returned.

The interpretation of the configured sampler Y'CbCr conversion is described in more detail in [the description of sampler Y'CbCr conversion](#) in the [Image Operations](#) chapter.

## Valid Usage

- The [sampler Y'CbCr conversion feature](#) **must** be enabled

## Valid Usage (Implicit)

- **device must** be a valid `VkDevice` handle
- **pCreateInfo must** be a valid pointer to a valid `VkSamplerYcbcrConversionCreateInfo` structure
- If **pAllocator** is not `NULL`, **pAllocator must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- **pYcbcrConversion must** be a valid pointer to a `VkSamplerYcbcrConversion` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkSamplerYcbcrConversionCreateInfo` structure is defined as:

```
typedef struct VkSamplerYcbcrConversionCreateInfo {
    VkStructureType          sType;
    const void*               pNext;
    VkFormat                  format;
    VkSamplerYcbcrModelConversion  ycbcrModel;
    VkSamplerYcbcrRange        ycbcrRange;
    VkComponentMapping        components;
    VkChromaLocation           xChromaOffset;
    VkChromaLocation           yChromaOffset;
    VkFilter                   chromaFilter;
    VkBool32                  forceExplicitReconstruction;
} VkSamplerYcbcrConversionCreateInfo;
```

or the equivalent

```
typedef VkSamplerYcbcrConversionCreateInfo VkSamplerYcbcrConversionCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `format` is the format of the image from which color information will be retrieved.
- `ycbcrModel` describes the color matrix for conversion between color models.
- `ycbcrRange` describes whether the encoded values have headroom and foot room, or whether the encoding uses the full numerical range.
- `components` applies a *swizzle* based on `VkComponentSwizzle` enums prior to range expansion and color model conversion.
- `xChromaOffset` describes the *sample location* associated with downsampled chroma channels in the x dimension. `xChromaOffset` has no effect for formats in which chroma channels are the same resolution as the luma channel.
- `yChromaOffset` describes the *sample location* associated with downsampled chroma channels in the y dimension. `yChromaOffset` has no effect for formats in which the chroma channels are not downsampled vertically.
- `chromaFilter` is the filter for chroma reconstruction.

- `forceExplicitReconstruction` can be used to ensure that reconstruction is done explicitly, if supported.

*Note*

Setting `forceExplicitReconstruction` to `VK_TRUE` may have a performance penalty on implementations where explicit reconstruction is not the default mode of operation.

If the `pNext` chain has an instance of `VkExternalFormatANDROID` with non-zero `externalFormat` member, the sampler  $\text{Y}^{\text{C}_\text{B}} \text{C}_\text{R}$  conversion object represents an *external format conversion*, and `format` must be `VK_FORMAT_UNDEFINED`. Such conversions must only be used to sample image views with a matching `external format`. When creating an external format conversion, the value of `components` is ignored.

## Valid Usage

- If an external format conversion is being created, `format` must be `VK_FORMAT_UNDEFINED`, otherwise it must not be `VK_FORMAT_UNDEFINED`.
- `format` must support `VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT` or `VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT`
- If the format does not support `VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT`, `xChromaOffset` and `yChromaOffset` must not be `VK_CHROMA_LOCATION_COSITED_EVEN`
- If the format does not support `VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT`, `xChromaOffset` and `yChromaOffset` must not be `VK_CHROMA_LOCATION_MIDPOINT`
- `format` must represent unsigned normalized values (i.e. the format must be a `UNORM` format)
- If the format has a `_422` or `_420` suffix, then `components.g` must be `VK_COMPONENT_SWIZZLE_IDENTITY`
- If the format has a `_422` or `_420` suffix, then `components.a` must be `VK_COMPONENT_SWIZZLE_IDENTITY`, `VK_COMPONENT_SWIZZLE_ONE`, or `VK_COMPONENT_SWIZZLE_ZERO`
- If the format has a `_422` or `_420` suffix, then `components.r` must be `VK_COMPONENT_SWIZZLE_IDENTITY` or `VK_COMPONENT_SWIZZLE_B`
- If the format has a `_422` or `_420` suffix, then `components.b` must be `VK_COMPONENT_SWIZZLE_IDENTITY` or `VK_COMPONENT_SWIZZLE_R`
- If the format has a `_422` or `_420` suffix, and if either `components.r` or `components.b` is `VK_COMPONENT_SWIZZLE_IDENTITY`, both values must be `VK_COMPONENT_SWIZZLE_IDENTITY`
- If `ycbcrModel` is not `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY`, then `components.r`, `components.g`, and `components.b` must correspond to channels of the `format`; that is, `components.r`, `components.g`, and `components.b` must not be `VK_COMPONENT_SWIZZLE_ZERO` or `VK_COMPONENT_SWIZZLE_ONE`, and must not correspond to a channel which contains zero or one as a consequence of conversion to `RGB`
- If `ycbcrRange` is `VK_SAMPLER_YCBCR_RANGE_ITU_NARROW` then the R, G and B channels obtained by applying the component swizzle to `format` must each have a bit-depth greater than or equal to 8.
- If the format does not support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT`, `forceExplicitReconstruction` must be `FALSE`
- If the format does not support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT`, `chromaFilter` must be `VK_FILTER_NEAREST`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_CREATE_INFO`
- `pNext` **must** be `NULL` or a pointer to a valid instance of `VkExternalFormatANDROID`
- `format` **must** be a valid `VkFormat` value
- `ycbcrModel` **must** be a valid `VkSamplerYcbcrModelConversion` value
- `ycbcrRange` **must** be a valid `VkSamplerYcbcrRange` value
- `components` **must** be a valid `VkComponentMapping` structure
- `xChromaOffset` **must** be a valid `VkChromaLocation` value
- `yChromaOffset` **must** be a valid `VkChromaLocation` value
- `chromaFilter` **must** be a valid `VkFilter` value

If `chromaFilter` is `VK_FILTER_NEAREST`, chroma samples are reconstructed to luma channel resolution using nearest-neighbour sampling. Otherwise, chroma samples are reconstructed using interpolation. More details can be found in [the description of sampler Y'CbCr conversion](#) in the [Image Operations](#) chapter.

`VkSamplerYcbcrModelConversion` defines the conversion from the source color model to the shader color model. Possible values are:

```
typedef enum VkSamplerYcbcrModelConversion {
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY = 0,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY = 1,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709 = 2,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601 = 3,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020 = 4,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_MAX_ENUM = 0x7FFFFFFF
} VkSamplerYcbcrModelConversion;
```

or the equivalent

```
typedef VkSamplerYcbcrModelConversion VkSamplerYcbcrModelConversionKHR;
```

- `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY` specifies that the input values to the conversion are unmodified.
- `VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY` specifies no model conversion but the inputs are range expanded as for Y'CB<sub>R</sub>.
- `VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709` specifies the color model conversion from Y'CB<sub>R</sub> to R'G'B' defined in BT.709 and described in the “BT.709 Y'CB<sub>R</sub> conversion” section of the [Kronos Data Format Specification](#).
- `VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601` specifies the color model conversion from Y'CB<sub>R</sub> to R'G'B' defined in BT.601 and described in the “BT.601 Y'CB<sub>R</sub> conversion” section of the [Kronos Data Format Specification](#).
- `VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020` specifies the color model conversion from Y'CB<sub>R</sub> to R'G'B' defined in BT.2020 and described in the “BT.2020 Y'CB<sub>R</sub> conversion” section of the [Kronos Data Format Specification](#).

In the `VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_*` color models, for the input to the sampler Y'CB<sub>R</sub> range expansion and model conversion:

- the Y (Y' luma) channel corresponds to the G channel of an RGB image.
- the CB (C<sub>B</sub> or “U” blue color difference) channel corresponds to the B channel of an RGB image.
- the CR (C<sub>R</sub> or “V” red color difference) channel corresponds to the R channel of an RGB image.
- the alpha channel, if present, is not modified by color model conversion.

These rules reflect the mapping of channels after the channel swizzle operation (controlled by `VkSamplerYcbcrConversionCreateInfo::components`).

*Note*

For example, an “YUVA” 32-bit format comprising four 8-bit channels can be implemented as `VK_FORMAT_R8G8B8A8_UNORM` with a component mapping:

- `components.a = VK_COMPONENT_SWIZZLE_IDENTITY`
- `components.r = VK_COMPONENT_SWIZZLE_B`
- `components.g = VK_COMPONENT_SWIZZLE_R`
- `components.b = VK_COMPONENT_SWIZZLE_G`

The `VkSamplerYcbcrRange` enum describes whether color channels are encoded using the full range of numerical values or whether values are reserved for headroom and foot room. `VkSamplerYcbcrRange` is defined as:

```

typedef enum VkSamplerYcbcrRange {
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL = 0,
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW = 1,
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_FULL,
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_NARROW,
    VK_SAMPLER_YCBCR_RANGE_MAX_ENUM = 0x7FFFFFFF
} VkSamplerYcbcrRange;

```

or the equivalent

```
typedef VkSamplerYcbcrRange VkSamplerYcbcrRangeKHR;
```

- **VK\_SAMPLER\_YCBCR\_RANGE\_ITU\_FULL** specifies that the full range of the encoded values are valid and interpreted according to the ITU “full range” quantization rules.
- **VK\_SAMPLER\_YCBCR\_RANGE\_ITU\_NARROW** specifies that headroom and foot room are reserved in the numerical range of encoded values, and the remaining values are expanded according to the ITU “narrow range” quantization rules.

The formulae for these conversions is described in the [Sampler Y'CbCr Range Expansion](#) section of the [Image Operations](#) chapter.

No range modification takes place if `ycbcrModel` is **VK\_SAMPLER\_YCBCR\_MODEL\_CONVERSION\_RGB\_IDENTITY**; the `ycbcrRange` field of `VkSamplerYcbcrConversionCreateInfo` is ignored in this case.

The `VkChromaLocation` enum defines the location of downsampled chroma channel samples relative to the luma samples, and is defined as:

```

typedef enum VkChromaLocation {
    VK_CHROMA_LOCATION_COSITED_EVEN = 0,
    VK_CHROMA_LOCATION_MIDPOINT = 1,
    VK_CHROMA_LOCATION_COSITED_EVEN_KHR = VK_CHROMA_LOCATION_COSITED_EVEN,
    VK_CHROMA_LOCATION_MIDPOINT_KHR = VK_CHROMA_LOCATION_MIDPOINT,
    VK_CHROMA_LOCATION_MAX_ENUM = 0x7FFFFFFF
} VkChromaLocation;

```

or the equivalent

```
typedef VkChromaLocation VkChromaLocationKHR;
```

- **VK\_CHROMA\_LOCATION\_COSITED\_EVEN** specifies that downsampled chroma samples are aligned with luma samples with even coordinates.
- **VK\_CHROMA\_LOCATION\_MIDPOINT** specifies that downsampled chroma samples are located half way between each even luma sample and the nearest higher odd luma sample.

To destroy a sampler Y'CbCr conversion, call:

```
void vkDestroySamplerYcbcrConversion(  
    VkDevice device,  
    VkSamplerYcbcrConversion ycbcrConversion,  
    const VkAllocationCallbacks* pAllocator);
```

or the equivalent command

```
void vkDestroySamplerYcbcrConversionKHR(  
    VkDevice device,  
    VkSamplerYcbcrConversion ycbcrConversion,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the Y'CbCr conversion.
- `ycbcrConversion` is the conversion to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

### Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `ycbcrConversion` is not `VK_NULL_HANDLE`, `ycbcrConversion` **must** be a valid `VkSamplerYcbcrConversion` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `ycbcrConversion` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `ycbcrConversion` **must** be externally synchronized

# Chapter 13. Resource Descriptors

A *descriptor* is an opaque data structure representing a shader resource such as a buffer, buffer view, image view, sampler, or combined image sampler. Descriptors are organised into *descriptor sets*, which are bound during command recording for use in subsequent draw commands. The arrangement of content in each descriptor set is determined by a *descriptor set layout*, which determines what descriptors can be stored within it. The sequence of descriptor set layouts that **can** be used by a pipeline is specified in a *pipeline layout*. Each pipeline object **can** use up to `maxBoundDescriptorSets` (see [Limits](#)) descriptor sets.

Shaders access resources via variables decorated with a descriptor set and binding number that link them to a descriptor in a descriptor set. The shader interface mapping to bound descriptor sets is described in the [Shader Resource Interface](#) section.

Shaders **can** also access buffers without going through descriptors by using [Physical Storage Buffer Access](#) to access them through 64-bit addresses.

## 13.1. Descriptor Types

There are a number of different types of descriptor supported by Vulkan, corresponding to different resources or usage. The following sections describe the API definitions of each descriptor type. The mapping of each type to SPIR-V is listed in the [Shader Resource and Descriptor Type Correspondence](#) and [Shader Resource and Storage Class Correspondence](#) tables in the [Shader Interfaces](#) chapter.

### 13.1.1. Storage Image

A *storage image* (`VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`) is a descriptor type associated with an [image resource](#) via an [image view](#) that load, store, and atomic operations **can** be performed on.

Storage image loads are supported in all shader stages for image views whose [format features](#) contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT`.

Stores to storage images are supported in compute shaders for image views whose [format features](#) contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT`.

Atomic operations on storage images are supported in compute shaders for image views whose [format features](#) contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

When the `fragmentStoresAndAtomics` feature is enabled, stores and atomic operations are also supported for storage images in fragment shaders with the same set of image formats as supported in compute shaders. When the `vertexPipelineStoresAndAtomics` feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of image formats as supported in compute shaders.

The image subresources for a storage image **must** be in the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` or `VK_IMAGE_LAYOUT_GENERAL` layout in order to access its data in a shader.

### 13.1.2. Sampler

A  *sampler descriptor*  (`VK_DESCRIPTOR_TYPE_SAMPLER`) is a descriptor type associated with a  *sampler*  object, used to control the behavior of  *sampling operations*  performed on a  *sampled image* .

### 13.1.3. Sampled Image

A  *sampled image*  (`VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`) is a descriptor type associated with an  *image resource*  via an  *image view*  that  *sampling operations*  **can** be performed on.

Shaders combine a  *sampled image*  variable and a  *sampler*  variable to perform sampling operations.

*Sampled images*  are supported in all shader stages for image views whose  *format features*  contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`.

The image subresources for a  *sampled image*  **must** be in the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL` layout in order to access its data in a shader.

### 13.1.4. Combined Image Sampler

A  *combined image sampler*  (`VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`) is a single descriptor type associated with both a  *sampler*  and an  *image resource* , combining both a  *sampler*  and  *sampled image*  descriptor into a single descriptor.

If the descriptor refers to a  *sampler*  that performs  *Y'CbCr conversion*  or samples a  *subsampled image* , the  *sampler*  **must** only be used to sample the image in the same descriptor. Otherwise, the  *sampler*  and  *image*  in this type of descriptor **can** be used freely with any other samplers and images.

The image subresources for a  *combined image sampler*  **must** be in the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL` layout in order to access its data in a shader.

*Note*

On some implementations, it **may** be more efficient to sample from an  *image*  using a combination of  *sampler*  and  *sampled image*  that are stored together in the descriptor set in a  *combined descriptor* .

### 13.1.5. Uniform Texel Buffer

A  *uniform texel buffer*  (`VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`) is a descriptor type associated with a  *buffer resource*  via a  *buffer view*  that  *formatted load operations*  **can** be performed on.

Uniform texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image.

Load operations from uniform texel buffers are supported in all shader stages for image formats which report support for the `VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT` feature bit via `vkGetPhysicalDeviceFormatProperties` in `VkFormatProperties::bufferFeatures`.

### 13.1.6. Storage Texel Buffer

A *storage texel buffer* (`VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`) is a descriptor type associated with a [buffer resource](#) via a [buffer view](#) that [formatted load, store, and atomic operations](#) **can** be performed on.

Storage texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image. Unlike [uniform texel buffers](#), these buffers can also be written to in the same way as for [storage images](#).

Storage texel buffer loads are supported in all shader stages for texel buffer formats which report support for the `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT` feature bit via `vkGetPhysicalDeviceFormatProperties` in `VkFormatProperties::bufferFeatures`.

Stores to storage texel buffers are supported in compute shaders for texel buffer formats which report support for the `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT` feature via `vkGetPhysicalDeviceFormatProperties` in `VkFormatProperties::bufferFeatures`.

Atomic operations on storage texel buffers are supported in compute shaders for texel buffer formats which report support for the `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT` feature via `vkGetPhysicalDeviceFormatProperties` in `VkFormatProperties::bufferFeatures`.

When the `fragmentStoresAndAtomics` feature is enabled, stores and atomic operations are also supported for storage texel buffers in fragment shaders with the same set of texel buffer formats as supported in compute shaders. When the `vertexPipelineStoresAndAtomics` feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of texel buffer formats as supported in compute shaders.

### 13.1.7. Storage Buffer

A *storage buffer* (`VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`) is a descriptor type associated with a [buffer resource](#) directly, described in a shader as a structure with various members that load, store, and atomic operations **can** be performed on.

#### Note

Atomic operations **can** only be performed on members of certain types as defined in the [SPIR-V environment appendix](#).

### 13.1.8. Uniform Buffer

A *uniform buffer* (`VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`) is a descriptor type associated with a [buffer resource](#) directly, described in a shader as a structure with various members that load operations

can be performed on.

### 13.1.9. Dynamic Uniform Buffer

A *dynamic uniform buffer* (`VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`) is almost identical to a [uniform buffer](#), and differs only in how the offset into the buffer is specified. The base offset calculated by the `VkDescriptorBufferInfo` when initially [updating the descriptor set](#) is added to a [dynamic offset](#) when binding the descriptor set.

### 13.1.10. Dynamic Storage Buffer

A *dynamic storage buffer* (`VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`) is almost identical to a [storage buffer](#), and differs only in how the offset into the buffer is specified. The base offset calculated by the `VkDescriptorBufferInfo` when initially [updating the descriptor set](#) is added to a [dynamic offset](#) when binding the descriptor set.

### 13.1.11. Inline Uniform Block

An *inline uniform block* (`VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`) is almost identical to a [uniform buffer](#), and differs only in taking its storage directly from the encompassing descriptor set instead of being backed by buffer memory. It is typically used to access a small set of constant data that does not require the additional flexibility provided by the indirection enabled when using a uniform buffer where the descriptor and the referenced buffer memory are decoupled. Compared to push constants, they allow reusing the same set of constant data across multiple disjoint sets of draw and dispatch commands.

Inline uniform block descriptors **cannot** be aggregated into arrays. Instead, the array size specified for an inline uniform block descriptor binding specifies the binding's capacity in bytes.

### 13.1.12. Input Attachment

An *input attachment* (`VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`) is a descriptor type associated with an [image resource](#) via an [image view](#) that **can** be used for [framebuffer local](#) load operations in fragment shaders.

All image formats that are supported for color attachments (`VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`) or depth/stencil attachments (`VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`) for a given image tiling mode are also supported for input attachments.

The image subresources for an input attachment **must** be in the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL` layout in order to access its data in a shader.

### 13.1.13. Acceleration Structure

An *acceleration structure* (`VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV`) is a descriptor type that is

used to retrieve scene geometry from within shaders bound to ray tracing pipelines. Shaders have read-only access to the memory.

## 13.2. Descriptor Sets

Descriptors are grouped together into descriptor set objects. A descriptor set object is an opaque object containing storage for a set of descriptors, where the types and number of descriptors is defined by a descriptor set layout. The layout object **may** be used to define the association of each descriptor binding with memory or other implementation resources. The layout is used both for determining the resources that need to be associated with the descriptor set, and determining the interface between shader stages and shader resources.

### 13.2.1. Descriptor Set Layout

A descriptor set layout object is defined by an array of zero or more descriptor bindings. Each individual descriptor binding is specified by a descriptor type, a count (array size) of the number of descriptors in the binding, a set of shader stages that **can** access the binding, and (if using immutable samplers) an array of sampler descriptors.

Descriptor set layout objects are represented by [VkDescriptorSetLayout](#) handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSetLayout)
```

To create descriptor set layout objects, call:

```
VkResult vkCreateDescriptorSetLayout(  
    VkDevice device,  
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkDescriptorSetLayout* pSetLayout);
```

- **device** is the logical device that creates the descriptor set layout.
- **pCreateInfo** is a pointer to a [VkDescriptorSetLayoutCreateInfo](#) structure specifying the state of the descriptor set layout object.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pSetLayout** is a pointer to a [VkDescriptorSetLayout](#) handle in which the resulting descriptor set layout object is returned.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkDescriptorSetLayoutCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `psetLayout` **must** be a valid pointer to a `VkDescriptorSetLayout` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Information about the descriptor set layout is passed in an instance of the `VkDescriptorSetLayoutCreateInfo` structure:

```
typedef struct VkDescriptorSetLayoutCreateInfo {
    VkStructureType                 sType;
    const void*                     pNext;
    VkDescriptorSetLayoutCreateFlags flags;
    uint32_t                        bindingCount;
    const VkDescriptorSetLayoutBinding* pBindings;
} VkDescriptorSetLayoutCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is a bitmask of `VkDescriptorSetLayoutCreateFlagBits` specifying options for descriptor set layout creation.
- `bindingCount` is the number of elements in `pBindings`.
- `pBindings` is a pointer to an array of `VkDescriptorSetLayoutBinding` structures.

## Valid Usage

- The `VkDescriptorSetLayoutBinding::binding` members of the elements of the `pBindings` array **must** each have different values.
- If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`, then all elements of `pBindings` **must** not have a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`
- If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`, then all elements of `pBindings` **must** not have a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`
- If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`, then the total number of elements of all bindings **must** be less than or equal to `VkPhysicalDevicePushDescriptorPropertiesKHR::maxPushDescriptors`
- If any binding has the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT` bit set, `flags` **must** include `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT`
- If any binding has the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT` bit set, then all bindings **must** not have `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO`
- `pNext` **must** be `NULL` or a pointer to a valid instance of `VkDescriptorSetLayoutBindingFlagsCreateInfoEXT`
- `flags` **must** be a valid combination of `VkDescriptorSetLayoutCreateFlagBits` values
- If `bindingCount` is not `0`, `pBindings` **must** be a valid pointer to an array of `bindingCount` valid `VkDescriptorSetLayoutBinding` structures

Bits which **can** be set in `VkDescriptorSetLayoutCreateInfo::flags` to specify options for descriptor set layout are:

```
typedef enum VkDescriptorSetLayoutCreateFlagBits {
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR = 0x00000001,
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT = 0x00000002,
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkDescriptorSetLayoutCreateFlagBits;
```

- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` specifies that descriptor sets **must** not be allocated using this layout, and descriptors are instead pushed by `vkCmdPushDescriptorSetKHR`.
- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` specifies that descriptor sets using this layout **must** be allocated from a descriptor pool created with the

`VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT` bit set. Descriptor set layouts created with this bit set have alternate limits for the maximum number of descriptors per-stage and per-pipeline layout. The `non-UpdateAfterBind` limits only count descriptors in sets created without this flag. The `UpdateAfterBind` limits count all descriptors, but the limits **may** be higher than the `non-UpdateAfterBind` limits.

```
typedef VkFlags VkDescriptorSetLayoutCreateFlags;
```

`VkDescriptorSetLayoutCreateFlags` is a bitmask type for setting a mask of zero or more `VkDescriptorSetLayoutCreateFlagBits`.

The `VkDescriptorSetLayoutBinding` structure is defined as:

```
typedef struct VkDescriptorSetLayoutBinding {
    uint32_t          binding;
    VkDescriptorType   descriptorType;
    uint32_t          descriptorCount;
    VkShaderStageFlags stageFlags;
    const VkSampler*   pImmutableSamplers;
} VkDescriptorSetLayoutBinding;
```

- `binding` is the binding number of this entry and corresponds to a resource of the same binding number in the shader stages.
- `descriptorType` is a `VkDescriptorType` specifying which type of resource descriptors are used for this binding.
- `descriptorCount` is the number of descriptors contained in the binding, accessed in a shader as an array, except if `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` in which case `descriptorCount` is the size in bytes of the inline uniform block. If `descriptorCount` is zero this binding entry is reserved and the resource **must** not be accessed from any stage via this binding within any pipeline using the set layout.
- `stageFlags` member is a bitmask of `VkShaderStageFlagBits` specifying which pipeline shader stages **can** access a resource for this binding. `VK_SHADER_STAGE_ALL` is a shorthand specifying that all defined shader stages, including any additional stages defined by extensions, **can** access the resource.

If a shader stage is not included in `stageFlags`, then a resource **must** not be accessed from that stage via this binding within any pipeline using the set layout. Other than input attachments which are limited to the fragment shader, there are no limitations on what combinations of stages **can** use a descriptor binding, and in particular a binding **can** be used by both graphics stages and the compute stage.

- `pImmutableSamplers` affects initialization of samplers. If `descriptorType` specifies a `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` type descriptor, then `pImmutableSamplers` **can** be used to initialize a set of *immutable samplers*. Immutable samplers are permanently bound into the set layout and **must** not be changed; updating a `VK_DESCRIPTOR_TYPE_SAMPLER` descriptor with immutable samplers is not allowed and updates to a

`VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` descriptor with immutable samplers does not modify the samplers (the image views are updated, but the sampler updates are ignored). If `pImmutableSamplers` is not `NULL`, then it points to an array of sampler handles that will be copied into the set layout and used for the corresponding binding. Only the sampler handles are copied; the sampler objects **must** not be destroyed before the final use of the set layout and any descriptor pools and sets created using it. If `pImmutableSamplers` is `NULL`, then the sampler slots are dynamic and sampler handles **must** be bound into descriptor sets using this layout. If `descriptorType` is not one of these descriptor types, then `pImmutableSamplers` is ignored.

The above layout definition allows the descriptor bindings to be specified sparsely such that not all binding numbers between 0 and the maximum binding number need to be specified in the `pBindings` array. Bindings that are not specified have a `descriptorCount` and `stageFlags` of zero, and the value of `descriptorType` is undefined. However, all binding numbers between 0 and the maximum binding number in the `VkDescriptorSetLayoutCreateInfo::pBindings` array **may** consume memory in the descriptor set layout even if not all descriptor bindings are used, though it **should** not consume additional memory from the descriptor pool.

*Note*

The maximum binding number specified **should** be as compact as possible to avoid wasted memory.

## Valid Usage

- If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `descriptorCount` is not `0` and `pImmutableSamplers` is not `NULL`, `pImmutableSamplers` **must** be a valid pointer to an array of `descriptorCount` valid `VkSampler` handles
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` then `descriptorCount` **must** be a multiple of `4`
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` then `descriptorCount` **must** be less than or equal to `VkPhysicalDeviceInlineUniformBlockPropertiesEXT::maxInlineUniformBlockSize`
- If `descriptorCount` is not `0`, `stageFlags` **must** be a valid combination of `VkShaderStageFlagBits` values
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` and `descriptorCount` is not `0`, then `stageFlags` **must** be `0` or `VK_SHADER_STAGE_FRAGMENT_BIT`

## Valid Usage (Implicit)

- `descriptorType` **must** be a valid `VkDescriptorType` value

If the `pNext` chain of a `VkDescriptorSetLayoutCreateInfo` structure includes a `VkDescriptorSetLayoutBindingFlagsCreateInfoEXT` structure, then that structure includes an array of flags, one for each descriptor set layout binding.

The [VkDescriptorSetLayoutBindingFlagsCreateInfoEXT](#) structure is defined as:

```
typedef struct VkDescriptorSetLayoutBindingFlagsCreateInfoEXT {
    VkStructureType           sType;
    const void*                pNext;
    uint32_t                  bindingCount;
    const VkDescriptorBindingFlagsEXT*  pBindingFlags;
} VkDescriptorSetLayoutBindingFlagsCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `bindingCount` is zero or the number of elements in `pBindingFlags`.
- `pBindingFlags` is a pointer to an array of [VkDescriptorBindingFlagsEXT](#) bitfields, one for each descriptor set layout binding.

If `bindingCount` is zero or if this structure is not in the `pNext` chain, the [VkDescriptorBindingFlagsEXT](#) for each descriptor set layout binding is considered to be zero. Otherwise, the descriptor set layout binding at `VkDescriptorSetLayoutCreateInfo::pBindings[i]` uses the flags in `pBindingFlags[i]`.

## Valid Usage

- If `bindingCount` is not zero, `bindingCount` **must** equal `VkDescriptorSetLayoutCreateInfo`  
`::bindingCount`
- If `VkDescriptorSetLayoutCreateInfo::flags` includes  
`VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`, then all elements of  
`pBindingFlags` **must** not include `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT`,  
`VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT_EXT`, or  
`VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT_EXT`
- If an element of `pBindingFlags` includes  
`VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT_EXT`, then all other elements of  
`VkDescriptorSetLayoutCreateInfo::pBindings` **must** have a smaller value of `binding`
- If `VkPhysicalDeviceDescriptorIndexingFeaturesEXT`  
`::descriptorBindingUniformBufferUpdateAfterBind` is not enabled, all bindings with  
descriptor type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` **must** not use  
`VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT`
- If `VkPhysicalDeviceDescriptorIndexingFeaturesEXT`  
`::descriptorBindingSampledImageUpdateAfterBind` is not enabled, all bindings with  
descriptor type `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`,  
or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` **must** not use  
`VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT`
- If `VkPhysicalDeviceDescriptorIndexingFeaturesEXT`  
`::descriptorBindingStorageImageUpdateAfterBind` is not enabled, all bindings with  
descriptor type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` **must** not use  
`VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT`
- If `VkPhysicalDeviceDescriptorIndexingFeaturesEXT`  
`::descriptorBindingStorageBufferUpdateAfterBind` is not enabled, all bindings with  
descriptor type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` **must** not use  
`VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT`
- If `VkPhysicalDeviceDescriptorIndexingFeaturesEXT`  
`::descriptorBindingUniformTexelBufferUpdateAfterBind` is not enabled, all bindings with  
descriptor type `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` **must** not use  
`VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT`
- If `VkPhysicalDeviceDescriptorIndexingFeaturesEXT`  
`::descriptorBindingStorageTexelBufferUpdateAfterBind` is not enabled, all bindings with  
descriptor type `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` **must** not use  
`VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT`
- If `VkPhysicalDeviceInlineUniformBlockFeaturesEXT`  
`::descriptorBindingInlineUniformBlockUpdateAfterBind` is not enabled, all bindings with  
descriptor type `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` **must** not use  
`VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT`
- All bindings with descriptor type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`,  
`VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`  
**must** not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT`
- If `VkPhysicalDeviceDescriptorIndexingFeaturesEXT`

`::descriptorBindingUpdateUnusedWhilePending` is not enabled, all elements of `pBindingFlags` **must** not include `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT_EXT`

- If `VkPhysicalDeviceDescriptorIndexingFeaturesEXT::descriptorBindingPartiallyBound` is not enabled, all elements of `pBindingFlags` **must** not include `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT_EXT`
- If `VkPhysicalDeviceDescriptorIndexingFeaturesEXT::descriptorBindingVariableDescriptorCount` is not enabled, all elements of `pBindingFlags` **must** not include `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT_EXT`
- If an element of `pBindingFlags` includes `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT_EXT`, that element's `descriptorType` **must** not be `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_BINDING_FLAGS_CREATE_INFO_EXT`
- If `bindingCount` is not `0`, and `pBindingFlags` is not `NULL`, `pBindingFlags` **must** be a valid pointer to an array of `bindingCount` valid combinations of `VkDescriptorBindingFlagBitsEXT` values

Bits which **can** be set in each element of `VkDescriptorSetLayoutBindingFlagsCreateInfoEXT` `::pBindingFlags` to specify options for the corresponding descriptor set layout binding are:

```
typedef enum VkDescriptorBindingFlagBitsEXT {
    VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT = 0x00000001,
    VK_DESCRIPTOR_BINDING_UPDATE_UNUSED WHILE_PENDING_BIT_EXT = 0x00000002,
    VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT_EXT = 0x00000004,
    VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT_EXT = 0x00000008,
    VK_DESCRIPTOR_BINDING_FLAG_BITS_MAX_ENUM_EXT = 0x7FFFFFFF
} VkDescriptorBindingFlagBitsEXT;
```

- `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT` indicates that if descriptors in this binding are updated between when the descriptor set is bound in a command buffer and when that command buffer is submitted to a queue, then the submission will use the most recently set descriptors for this binding and the updates do not invalidate the command buffer. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in `vkUpdateDescriptorSetWithTemplateKHR` and `vkUpdateDescriptorSets`. Multiple descriptors with this flag set **can** be updated concurrently in different threads, though the same descriptor **must** not be updated concurrently by two threads. Descriptors with this flag set **can** be updated concurrently with the set being bound to a command buffer in another thread, but not concurrently with the set being reset or freed.
- `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT_EXT` indicates that descriptors in this binding that are not *dynamically used* need not contain valid descriptors at the time the descriptors are consumed. A descriptor is dynamically used if any shader invocation executes an instruction

that performs any memory access using the descriptor.

- `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT_EXT` indicates that descriptors in this binding **can** be updated after a command buffer has bound this descriptor set, or while a command buffer that uses this descriptor set is pending execution, as long as the descriptors that are updated are not used by those command buffers. If `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT_EXT` is also set, then descriptors **can** be updated as long as they are not dynamically used by any shader invocations. If `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT_EXT` is not set, then descriptors **can** be updated as long as they are not statically used by any shader invocations.
- `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT_EXT` indicates that this descriptor binding has a variable size that will be specified when a descriptor set is allocated using this layout. The value of `descriptorCount` is treated as an upper bound on the size of the binding. This **must** only be used for the last binding in the descriptor set layout (i.e. the binding with the largest value of `binding`). For the purposes of counting against limits such as `maxDescriptorSet*` and `maxPerStageDescriptor*`, the full value of `descriptorCount` is counted, except for descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` where `descriptorCount` specifies the upper bound on the byte size of the binding, thus it counts against the `maxInlineUniformBlockSize` limit instead. .

*Note*

Note that while `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT` and `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT_EXT` both involve updates to descriptor sets after they are bound, `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT_EXT` is a weaker requirement since it is only about descriptors that are not used, whereas `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT` requires the implementation to observe updates to descriptors that are used.

```
typedef VkFlags VkDescriptorBindingFlagsEXT;
```

`VkDescriptorBindingFlagsEXT` is a bitmask type for setting a mask of zero or more `VkDescriptorBindingFlagBitsEXT`.

To query information about whether a descriptor set layout **can** be created, call:

```
void vkGetDescriptorSetLayoutSupport(  
    VkDevice device,  
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,  
    VkDescriptorSetLayoutSupport* pSupport);
```

or the equivalent command

```
void vkGetDescriptorSetLayoutSupportKHR(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    VkDescriptorSetLayoutSupport* pSupport);
```

- `device` is the logical device that would create the descriptor set layout.
- `pCreateInfo` is a pointer to a `VkDescriptorSetLayoutCreateInfo` structure specifying the state of the descriptor set layout object.
- `pSupport` is a pointer to a `VkDescriptorSetLayoutSupport` structure, in which information about support for the descriptor set layout object is returned.

Some implementations have limitations on what fits in a descriptor set which are not easily expressible in terms of existing limits like `maxDescriptorSet`\*, for example if all descriptor types share a limited space in memory but each descriptor is a different size or alignment. This command returns information about whether a descriptor set satisfies this limit. If the descriptor set layout satisfies the `VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors` limit, this command is guaranteed to return `VK_TRUE` in `VkDescriptorSetLayoutSupport::supported`. If the descriptor set layout exceeds the `VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors` limit, whether the descriptor set layout is supported is implementation-dependent and **may** depend on whether the descriptor sizes and alignments cause the layout to exceed an internal limit.

This command does not consider other limits such as `maxPerStageDescriptor`\*, and so a descriptor set layout that is supported according to this command **must** still satisfy the pipeline layout limits such as `maxPerStageDescriptor`\* in order to be used in a pipeline layout.

*Note*

This is a `VkDevice` query rather than `VkPhysicalDevice` because the answer **may** depend on enabled features.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkDescriptorSetLayoutCreateInfo` structure
- `pSupport` **must** be a valid pointer to a `VkDescriptorSetLayoutSupport` structure

Information about support for the descriptor set layout is returned in an instance of the `VkDescriptorSetLayoutSupport` structure:

```
typedef struct VkDescriptorSetLayoutSupport {
    VkStructureType sType;
    void* pNext;
    VkBool32 supported;
} VkDescriptorSetLayoutSupport;
```

or the equivalent

```
typedef VkDescriptorSetLayoutSupport VkDescriptorSetLayoutSupportKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `supported` specifies whether the descriptor set layout **can** be created.

`supported` is set to `VK_TRUE` if the descriptor set **can** be created, or else is set to `VK_FALSE`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_SUPPORT`
- `pNext` **must** be `NULL` or a pointer to a valid instance of `VkDescriptorSetVariableDescriptorCountLayoutSupportEXT`

If the `pNext` chain of a `VkDescriptorSetLayoutSupport` structure includes a `VkDescriptorSetVariableDescriptorCountLayoutSupportEXT` structure, then that structure returns additional information about whether the descriptor set layout is supported.

```
typedef struct VkDescriptorSetVariableDescriptorCountLayoutSupportEXT {  
    VkStructureType sType;  
    void* pNext;  
    uint32_t maxVariableDescriptorCount;  
} VkDescriptorSetVariableDescriptorCountLayoutSupportEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `maxVariableDescriptorCount` indicates the maximum number of descriptors supported in the highest numbered binding of the layout, if that binding is variable-sized. If the highest numbered binding of the layout has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` then `maxVariableDescriptorCount` indicates the maximum byte size supported for the binding, if that binding is variable-sized.

If the create info includes a variable-sized descriptor, then `supported` is determined assuming the requested size of the variable-sized descriptor, and `maxVariableDescriptorCount` is set to the maximum size of that descriptor that **can** be successfully created (which is greater than or equal to the requested size passed in). If the create info does not include a variable-sized descriptor or if the `VkPhysicalDeviceDescriptorIndexingFeaturesEXT::descriptorBindingVariableDescriptorCount` feature is not enabled, then `maxVariableDescriptorCount` is set to zero. For the purposes of this command, a variable-sized descriptor binding with a `descriptorCount` of zero is treated as if the `descriptorCount` is one, and thus the binding is not ignored and the maximum descriptor count will be returned. If the layout is not supported, then the value written to `maxVariableDescriptorCount` is undefined.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_LAYOUT_SUPPORT_EXT`

The following examples show a shader snippet using two descriptor sets, and application code that creates corresponding descriptor set layouts.

### *GLSL example*

```
//  
// binding to a single sampled image descriptor in set 0  
//  
layout (set=0, binding=0) uniform texture2D mySampledImage;  
  
//  
// binding to an array of sampled image descriptors in set 0  
//  
layout (set=0, binding=1) uniform texture2D myArrayOfSampledImages[12];  
  
//  
// binding to a single uniform buffer descriptor in set 1  
//  
layout (set=1, binding=0) uniform myUniformBuffer  
{  
    vec4 myElement[32];  
};
```

### SPIR-V example

```
...
%1 = OpExtInstImport "GLSL.std.450"
...
OpName %9 "mySampledImage"
OpName %14 "myArrayOfSampledImages"
OpName %18 "myUniformBuffer"
OpMemberName %18 0 "myElement"
OpName %20 ""
OpDecorate %9 DescriptorSet 0
OpDecorate %9 Binding 0
OpDecorate %14 DescriptorSet 0
OpDecorate %14 Binding 1
OpDecorate %17 ArrayStride 16
OpMemberDecorate %18 0 Offset 0
OpDecorate %18 Block
OpDecorate %20 DescriptorSet 1
OpDecorate %20 Binding 0
%2 = OpTypeVoid
%3 = OpTypeFunction %2
%6 = OpTypeFloat 32
%7 = OpTypeImage %6 2D 0 0 0 1 Unknown
%8 = OpTypePointer UniformConstant %7
%9 = OpVariable %8 UniformConstant
%10 = OpTypeInt 32 0
%11 = OpConstant %10 12
%12 = OpTypeArray %7 %11
%13 = OpTypePointer UniformConstant %12
%14 = OpVariable %13 UniformConstant
%15 = OpTypeVector %6 4
%16 = OpConstant %10 32
%17 = OpTypeArray %15 %16
%18 = OpTypeStruct %17
%19 = OpTypePointer Uniform %18
%20 = OpVariable %19 Uniform
...
```

### API example

```
VkResult myResult;

const VkDescriptorSetLayoutBinding myDescriptorSetLayoutBinding[] =
{
    // binding to a single image descriptor
    {
        0,                                     // binding
        VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,       // descriptorType
        1,                                     // descriptorCount
        VK_SHADER_STAGE_FRAGMENT_BIT,           // stageFlags
    }
};
```

```

        NULL                                // pImmutableSamplers
    },

    // binding to an array of image descriptors
    {
        1,                                     // binding
        VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,       // descriptorType
        12,                                    // descriptorCount
        VK_SHADER_STAGE_FRAGMENT_BIT,           // stageFlags
        NULL                                   // pImmutableSamplers
    },

    // binding to a single uniform buffer descriptor
    {
        0,                                     // binding
        VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER,     // descriptorType
        1,                                     // descriptorCount
        VK_SHADER_STAGE_FRAGMENT_BIT,           // stageFlags
        NULL                                   // pImmutableSamplers
    }
};

const VkDescriptorSetLayoutCreateInfo myDescriptorSetLayoutCreateInfo[] =
{
    // Create info for first descriptor set with two descriptor bindings
    {
        VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,      // sType
        NULL,                                                 // pNext
        0,                                                   // flags
        2,                                                   // bindingCount
        &myDescriptorSetLayoutBinding[0]                         // pBindings
    },

    // Create info for second descriptor set with one descriptor binding
    {
        VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,      // sType
        NULL,                                                 // pNext
        0,                                                   // flags
        1,                                                   // bindingCount
        &myDescriptorSetLayoutBinding[2]                         // pBindings
    }
};

VkDescriptorSetLayout myDescriptorSetLayout[2];

// Create first descriptor set layout
// myResult = vkCreateDescriptorSetLayout(
//     myDevice,
//     &myDescriptorSetLayoutCreateInfo[0],

```

```

    NULL,
    &myDescriptorSetLayout[0]);

// Create second descriptor set layout
//
myResult = vkCreateDescriptorSetLayout(
    myDevice,
    &myDescriptorSetLayoutCreateInfo[1],
    NULL,
    &myDescriptorSetLayout[1]);

```

To destroy a descriptor set layout, call:

```

void vkDestroyDescriptorSetLayout(
    VkDevice                                     device,
    VkDescriptorSetLayout                         descriptorSetLayout,
    const VkAllocationCallbacks*                  pAllocator);

```

- `device` is the logical device that destroys the descriptor set layout.
- `descriptorSetLayout` is the descriptor set layout to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- If `VkAllocationCallbacks` were provided when `descriptorSetLayout` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `descriptorSetLayout` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `descriptorSetLayout` is not `VK_NULL_HANDLE`, `descriptorSetLayout` **must** be a valid `VkDescriptorSetLayout` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `descriptorSetLayout` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `descriptorSetLayout` **must** be externally synchronized

### 13.2.2. Pipeline Layouts

Access to descriptor sets from a pipeline is accomplished through a *pipeline layout*. Zero or more descriptor set layouts and zero or more push constant ranges are combined to form a pipeline layout object describing the complete set of resources that **can** be accessed by a pipeline. The pipeline layout represents a sequence of descriptor sets with each having a specific layout. This sequence of layouts is used to determine the interface between shader stages and shader resources. Each pipeline is created using a pipeline layout.

Pipeline layout objects are represented by `VkPipelineLayout` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineLayout)
```

To create a pipeline layout, call:

```
VkResult vkCreatePipelineLayout(  
    VkDevice                                     device,  
    const VkPipelineLayoutCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks*     pAllocator,  
    VkPipelineLayout*               pPipelineLayout);
```

- `device` is the logical device that creates the pipeline layout.
- `pCreateInfo` is a pointer to a `VkPipelineLayoutCreateInfo` structure specifying the state of the pipeline layout object.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pPipelineLayout` is a pointer to a `VkPipelineLayout` handle in which the resulting pipeline layout object is returned.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkPipelineLayoutCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pPipelineLayout` **must** be a valid pointer to a `VkPipelineLayout` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineLayoutCreateInfo` structure is defined as:

```
typedef struct VkPipelineLayoutCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineLayoutCreateFlags flags;
    uint32_t                  setLayoutCount;
    const VkDescriptorSetLayout* pSetLayouts;
    uint32_t                  pushConstantRangeCount;
    const VkPushConstantRange* pPushConstantRanges;
} VkPipelineLayoutCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is reserved for future use.
- `setLayoutCount` is the number of descriptor sets included in the pipeline layout.
- `pSetLayouts` is a pointer to an array of `VkDescriptorSetLayout` objects.
- `pushConstantRangeCount` is the number of push constant ranges included in the pipeline layout.
- `pPushConstantRanges` is a pointer to an array of `VkPushConstantRange` structures defining a set of push constant ranges for use in a single pipeline layout. In addition to descriptor set layouts, a pipeline layout also describes how many push constants **can** be accessed by each stage of the pipeline.

#### Note

Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

## Valid Usage

- `setLayoutCount` must be less than or equal to `VkPhysicalDeviceLimits::maxBoundDescriptorSets`
- The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorSamplers`
- The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` and `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorUniformBuffers`
- The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorStorageBuffers`
- The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorSampledImages`
- The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorStorageImages`
- The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorInputAttachments`
- The total number of bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceInlineUniformBlockPropertiesEXT::maxPerStageDescriptorInlineUniformBlocks`

- The total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingPropertiesEXT::maxPerStageDescriptorUpdateAfterBindSamplers`
- The total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` and `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingPropertiesEXT::maxPerStageDescriptorUpdateAfterBindUniformBuffers`
- The total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingPropertiesEXT::maxPerStageDescriptorUpdateAfterBindStorageBuffers`
- The total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingPropertiesEXT::maxPerStageDescriptorUpdateAfterBindSampledImages`
- The total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingPropertiesEXT::maxPerStageDescriptorUpdateAfterBindStorageImages`
- The total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingPropertiesEXT::maxPerStageDescriptorUpdateAfterBindInputAttachments`
- The total number of bindings with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` accessible to any given shader stage across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceInlineUniformBlockPropertiesEXT::maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks`
- The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetSamplers`
- The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to

### VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffers

- The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffersDynamic`
- The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffers`
- The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffersDynamic`
- The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetSampledImages`
- The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetStorageImages`
- The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDescriptorSetInputAttachments`
- The total number of bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceInlineUniformBlockPropertiesEXT::maxDescriptorSetInlineUniformBlocks`
- The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingPropertiesEXT::maxDescriptorSetUpdateAfterBindSamples`
- The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` accessible

across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to  
`VkPhysicalDeviceDescriptorIndexingPropertiesEXT::maxDescriptorSetUpdateAfterBindUniformBuffers`

- The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingPropertiesEXT::maxDescriptorSetUpdateAfterBindUniformBuffersDynamic`
- The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingPropertiesEXT::maxDescriptorSetUpdateAfterBindStorageBuffers`
- The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingPropertiesEXT::maxDescriptorSetUpdateAfterBindStorageBuffersDynamic`
- The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingPropertiesEXT::maxDescriptorSetUpdateAfterBindSampledImages`
- The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingPropertiesEXT::maxDescriptorSetUpdateAfterBindStorageImages`
- The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceDescriptorIndexingPropertiesEXT::maxDescriptorSetUpdateAfterBindInputAttachments`
- The total number of bindings with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceInlineUniformBlockPropertiesEXT::maxDescriptorSetUpdateAfterBindInlineUniformBlocks`
- Any two elements of `pPushConstantRanges` **must** not include the same stage in `stageFlags`
- `pSetLayouts` **must** not contain more than one descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` set
- The total number of bindings with a `descriptorType` of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV` accessible across all shader stages and across all elements of `pSetLayouts` **must** be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxDescriptorSetAccelerationStructures`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO`
- `pNext` **must** be `NULL`
- `flags` **must** be `0`
- If `setLayoutCount` is not `0`, `pSetLayouts` **must** be a valid pointer to an array of `setLayoutCount` valid `VkDescriptorSetLayout` handles
- If `pushConstantRangeCount` is not `0`, `pPushConstantRanges` **must** be a valid pointer to an array of `pushConstantRangeCount` valid `VkPushConstantRange` structures

```
typedef VkFlags VkPipelineLayoutCreateFlags;
```

`VkPipelineLayoutCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkPushConstantRange` structure is defined as:

```
typedef struct VkPushConstantRange {  
    VkShaderStageFlags    stageFlags;  
    uint32_t              offset;  
    uint32_t              size;  
} VkPushConstantRange;
```

- `stageFlags` is a set of stage flags describing the shader stages that will access a range of push constants. If a particular stage is not included in the range, then accessing members of that range of push constants from the corresponding shader stage will return undefined values.
- `offset` and `size` are the start offset and size, respectively, consumed by the range. Both `offset` and `size` are in units of bytes and **must** be a multiple of 4. The layout of the push constant variables is specified in the shader.

## Valid Usage

- `offset` **must** be less than `VkPhysicalDeviceLimits::maxPushConstantsSize`
- `offset` **must** be a multiple of 4
- `size` **must** be greater than 0
- `size` **must** be a multiple of 4
- `size` **must** be less than or equal to `VkPhysicalDeviceLimits::maxPushConstantsSize` minus `offset`

## Valid Usage (Implicit)

- `stageFlags` **must** be a valid combination of `VkShaderStageFlagBits` values
- `stageFlags` **must** not be `0`

Once created, pipeline layouts are used as part of pipeline creation (see [Pipelines](#)), as part of binding descriptor sets (see [Descriptor Set Binding](#)), and as part of setting push constants (see [Push Constant Updates](#)). Pipeline creation accepts a pipeline layout as input, and the layout **may** be used to map (set, binding, arrayElement) tuples to implementation resources or memory locations within a descriptor set. The assignment of implementation resources depends only on the bindings defined in the descriptor sets that comprise the pipeline layout, and not on any shader source.

All resource variables [statically used](#) in all shaders in a pipeline **must** be declared with a (set,binding,arrayElement) that exists in the corresponding descriptor set layout and is of an appropriate descriptor type and includes the set of shader stages it is used by in `stageFlags`. The pipeline layout **can** include entries that are not used by a particular pipeline, or that are dead-code eliminated from any of the shaders. The pipeline layout allows the application to provide a consistent set of bindings across multiple pipeline compiles, which enables those pipelines to be compiled in a way that the implementation **may** cheaply switch pipelines without reprogramming the bindings.

Similarly, the push constant block declared in each shader (if present) **must** only place variables at offsets that are each included in a push constant range with `stageFlags` including the bit corresponding to the shader stage that uses it. The pipeline layout **can** include ranges or portions of ranges that are not used by a particular pipeline, or for which the variables have been dead-code eliminated from any of the shaders.

There is a limit on the total number of resources of each type that **can** be included in bindings in all descriptor set layouts in a pipeline layout as shown in [Pipeline Layout Resource Limits](#). The “Total Resources Available” column gives the limit on the number of each type of resource that **can** be included in bindings in all descriptor sets in the pipeline layout. Some resource types count against multiple limits. Additionally, there are limits on the total number of each type of resource that **can** be used in any pipeline stage as described in [Shader Resource Limits](#).

*Table 17. Pipeline Layout Resource Limits*

Total Resources Available	Resource Types
<code>maxDescriptorSetSamplers</code> or <code>maxDescriptorSetUpdateAfterBindSamplers</code>	sampler
	combined image sampler
<code>maxDescriptorSetSampledImages</code> or <code>maxDescriptorSetUpdateAfterBindSampledImages</code>	sampled image
	combined image sampler
	uniform texel buffer
<code>maxDescriptorSetStorageImages</code> or <code>maxDescriptorSetUpdateAfterBindStorageImages</code>	storage image
	storage texel buffer

Total Resources Available	Resource Types
<code>maxDescriptorSetUniformBuffers</code> or <code>maxDescriptorSetUpdateAfterBindUniformBuffers</code>	uniform buffer
<code>maxDescriptorSetUniformBuffersDynamic</code> or <code>maxDescriptorSetUpdateAfterBindUniformBuffersDynamic</code>	uniform buffer dynamic
<code>maxDescriptorSetStorageBuffers</code> or <code>maxDescriptorSetUpdateAfterBindStorageBuffers</code>	storage buffer
<code>maxDescriptorSetStorageBuffersDynamic</code> or <code>maxDescriptorSetUpdateAfterBindStorageBuffersDynamic</code>	storage buffer dynamic
<code>maxDescriptorSetInputAttachments</code> or <code>maxDescriptorSetUpdateAfterBindInputAttachments</code>	input attachment
<code>maxDescriptorSetInlineUniformBlocks</code> or <code>maxDescriptorSetUpdateAfterBindInlineUniformBlocks</code>	inline uniform block
<code>maxDescriptorSetAccelerationStructures</code>	acceleration structure

To destroy a pipeline layout, call:

```
void vkDestroyPipelineLayout(
    VkDevice device,
    VkPipelineLayout pipelineLayout,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the pipeline layout.
- `pipelineLayout` is the pipeline layout to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- If `VkAllocationCallbacks` were provided when `pipelineLayout` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `pipelineLayout` was created, `pAllocator` **must** be `NULL`
- `pipelineLayout` **must** not have been passed to any `vkCmd*` command for any command buffers that are still in the `recording` state when `vkDestroyPipelineLayout` is called

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `pipelineLayout` is not `VK_NULL_HANDLE`, `pipelineLayout` **must** be a valid `VkPipelineLayout` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `pipelineLayout` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `pipelineLayout` **must** be externally synchronized

## Pipeline Layout Compatibility

Two pipeline layouts are defined to be “compatible for `push constants`” if they were created with identical push constant ranges. Two pipeline layouts are defined to be “compatible for set N” if they were created with *identically defined* descriptor set layouts for sets zero through N, and if they were created with identical push constant ranges.

When binding a descriptor set (see [Descriptor Set Binding](#)) to set number N, if the previously bound descriptor sets for sets zero through N-1 were all bound using compatible pipeline layouts, then performing this binding does not disturb any of the lower numbered sets. If, additionally, the previous bound descriptor set for set N was bound using a pipeline layout compatible for set N, then the bindings in sets numbered greater than N are also not disturbed.

Similarly, when binding a pipeline, the pipeline **can** correctly access any previously bound descriptor sets which were bound with compatible pipeline layouts, as long as all lower numbered sets were also bound with compatible layouts.

Layout compatibility means that descriptor sets **can** be bound to a command buffer for use by any pipeline created with a compatible pipeline layout, and without having bound a particular pipeline first. It also means that descriptor sets **can** remain valid across a pipeline change, and the same resources will be accessible to the newly bound pipeline.

## Implementor’s Note

A consequence of layout compatibility is that when the implementation compiles a pipeline layout and maps pipeline resources to implementation resources, the mechanism for set N **should** only be a function of sets [0..N].

*Note*

Place the least frequently changing descriptor sets near the start of the pipeline layout, and place the descriptor sets representing the most frequently changing resources near the end. When pipelines are switched, only the descriptor set bindings that have been invalidated will need to be updated and the remainder of the descriptor set bindings will remain in place.

The maximum number of descriptor sets that **can** be bound to a pipeline layout is queried from physical device properties (see [maxBoundDescriptorSets](#) in [Limits](#)).

*API example*

```
const VkDescriptorSetLayout layouts[] = { layout1, layout2 };

const VkPushConstantRange ranges[] =
{
    {
        VK_PIPELINE_STAGE_VERTEX_SHADER_BIT, // stageFlags
        0, // offset
        4 // size
    },
    {
        VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT, // stageFlags
        4, // offset
        4 // size
    },
};

const VkPipelineLayoutCreateInfo createInfo =
{
    VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO, // sType
    NULL, // pNext
    0, // flags
    2, // setLayoutCount
    layouts, // pSetLayouts
    2, // pushConstantRangeCount
    ranges // pPushConstantRanges
};

VkPipelineLayout myPipelineLayout;
myResult = vkCreatePipelineLayout(
    myDevice,
    &createInfo,
    NULL,
    &myPipelineLayout);
```

### 13.2.3. Allocation of Descriptor Sets

A *descriptor pool* maintains a pool of descriptors, from which descriptor sets are allocated. Descriptor pools are externally synchronized, meaning that the application **must** not allocate and/or free descriptor sets from the same pool in multiple threads simultaneously.

Descriptor pools are represented by `VkDescriptorPool` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorPool)
```

To create a descriptor pool object, call:

```
VkResult vkCreateDescriptorPool(  
    VkDevice device,  
    const VkDescriptorPoolCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkDescriptorPool* pDescriptorPool);
```

- `device` is the logical device that creates the descriptor pool.
- `pCreateInfo` is a pointer to a `VkDescriptorPoolCreateInfo` structure specifying the state of the descriptor pool object.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pDescriptorPool` is a pointer to a `VkDescriptorPool` handle in which the resulting descriptor pool object is returned.

`pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

The created descriptor pool is returned in `pDescriptorPool`.

#### Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkDescriptorPoolCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pDescriptorPool` **must** be a valid pointer to a `VkDescriptorPool` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_FRAGMENTATION_EXT`

Additional information about the pool is passed in an instance of the `VkDescriptorPoolCreateInfo` structure:

```
typedef struct VkDescriptorPoolCreateInfo {
    VkStructureType          sType;
    const void*               pNext;
    VkDescriptorPoolCreateFlags flags;
    uint32_t                  maxSets;
    uint32_t                  poolSizeCount;
    const VkDescriptorPoolSize* pPoolSizes;
} VkDescriptorPoolCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is a bitmask of `VkDescriptorPoolCreateFlagBits` specifying certain supported operations on the pool.
- `maxSets` is the maximum number of descriptor sets that **can** be allocated from the pool.
- `poolSizeCount` is the number of elements in `pPoolSizes`.
- `pPoolSizes` is a pointer to an array of `VkDescriptorPoolSize` structures, each containing a descriptor type and number of descriptors of that type to be allocated in the pool.

If multiple `VkDescriptorPoolSize` structures appear in the `pPoolSizes` array then the pool will be created with enough storage for the total number of descriptors of each type.

Fragmentation of a descriptor pool is possible and **may** lead to descriptor set allocation failures. A failure due to fragmentation is defined as failing a descriptor set allocation despite the sum of all outstanding descriptor set allocations from the pool plus the requested allocation requiring no more than the total number of descriptors requested at pool creation. Implementations provide certain guarantees of when fragmentation **must** not cause allocation failure, as described below.

If a descriptor pool has not had any descriptor sets freed since it was created or most recently reset then fragmentation **must** not cause an allocation failure (note that this is always the case for a pool created without the `VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT` bit set). Additionally, if all sets allocated from the pool since it was created or most recently reset use the same number of descriptors (of each type) and the requested allocation also uses that same number of descriptors

(of each type), then fragmentation **must** not cause an allocation failure.

If an allocation failure occurs due to fragmentation, an application **can** create an additional descriptor pool to perform further descriptor set allocations.

If `flags` has the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT` bit set, descriptor pool creation **may** fail with the error `VK_ERROR_FRAGMENTATION_EXT` if the total number of descriptors across all pools (including this one) created with this bit set exceeds `maxUpdateAfterBindDescriptorsInAllPools`, or if fragmentation of the underlying hardware resources occurs.

## Valid Usage

- `maxSets` **must** be greater than 0

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_CREATE_INFO`
- `pNext` **must** be `NULL` or a pointer to a valid instance of `VkDescriptorPoolInlineUniformBlockCreateInfoEXT`
- `flags` **must** be a valid combination of `VkDescriptorPoolCreateFlagBits` values
- `pPoolSizes` **must** be a valid pointer to an array of `poolSizeCount` valid `VkDescriptorPoolSize` structures
- `poolSizeCount` **must** be greater than 0

In order to be able to allocate descriptor sets having [inline uniform block](#) bindings the descriptor pool **must** be created with specifying the inline uniform block binding capacity of the descriptor pool, in addition to the total inline uniform data capacity in bytes which is specified through an instance of the `VkDescriptorPoolSize` structure with a `descriptorType` value of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`. This **can** be done by chaining an instance of the `VkDescriptorPoolInlineUniformBlockCreateInfoEXT` structure to the `pNext` chain of `VkDescriptorPoolCreateInfo`.

The `VkDescriptorPoolInlineUniformBlockCreateInfoEXT` structure is defined as:

```
typedef struct VkDescriptorPoolInlineUniformBlockCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxInlineUniformBlockBindings;
} VkDescriptorPoolInlineUniformBlockCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `maxInlineUniformBlockBindings` is the number of inline uniform block bindings to allocate.

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_INLINE_UNIFORM_BLOCK_CREATE_INFO_EXT`

Bits which **can** be set in `VkDescriptorPoolCreateInfo::flags` to enable operations on a descriptor pool are:

```
typedef enum VkDescriptorPoolCreateFlagBits {
    VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT = 0x00000001,
    VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT = 0x00000002,
    VK_DESCRIPTOR_POOL_CREATE_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkDescriptorPoolCreateFlagBits;
```

- `VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT` specifies that descriptor sets **can** return their individual allocations to the pool, i.e. all of `vkAllocateDescriptorSets`, `vkFreeDescriptorSets`, and `vkResetDescriptorPool` are allowed. Otherwise, descriptor sets allocated from the pool **must** not be individually freed back to the pool, i.e. only `vkAllocateDescriptorSets` and `vkResetDescriptorPool` are allowed.
- `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT` specifies that descriptor sets allocated from this pool **can** include bindings with the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT` bit set. It is valid to allocate descriptor sets that have bindings that do not set the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT` bit from a pool that has `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT` set.

```
typedef VkFlags VkDescriptorPoolCreateFlags;
```

`VkDescriptorPoolCreateFlags` is a bitmask type for setting a mask of zero or more `VkDescriptorPoolCreateFlagBits`.

The `VkDescriptorPoolSize` structure is defined as:

```
typedef struct VkDescriptorPoolSize {
    VkDescriptorType      type;
    uint32_t              descriptorCount;
} VkDescriptorPoolSize;
```

- `type` is the type of descriptor.
- `descriptorCount` is the number of descriptors of that type to allocate. If `type` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` then `descriptorCount` is the number of bytes to allocate for descriptors of this type.

*Note*

When creating a descriptor pool that will contain descriptors for combined image samplers of multi-planar formats, an application needs to account for non-trivial descriptor consumption when choosing the `descriptorCount` value, as indicated by `VkSamplerYcbcrConversionImageFormatProperties::combinedImageSamplerDescriptorCount`.

## Valid Usage

- `descriptorCount` **must** be greater than `0`
- If `type` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` then `descriptorCount` **must** be a multiple of `4`

## Valid Usage (Implicit)

- `type` **must** be a valid `VkDescriptorType` value

To destroy a descriptor pool, call:

```
void vkDestroyDescriptorPool(  
    VkDevice                                     device,  
    VkDescriptorPool                            descriptorPool,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the descriptor pool.
- `descriptorPool` is the descriptor pool to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

When a pool is destroyed, all descriptor sets allocated from the pool are implicitly freed and become invalid. Descriptor sets allocated from a given pool do not need to be freed before destroying that descriptor pool.

## Valid Usage

- All submitted commands that refer to `descriptorPool` (via any allocated descriptor sets) **must** have completed execution
- If `VkAllocationCallbacks` were provided when `descriptorPool` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `descriptorPool` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `descriptorPool` is not `VK_NULL_HANDLE`, `descriptorPool` **must** be a valid `VkDescriptorPool` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `descriptorPool` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `descriptorPool` **must** be externally synchronized

Descriptor sets are allocated from descriptor pool objects, and are represented by `VkDescriptorSet` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSet)
```

To allocate descriptor sets from a descriptor pool, call:

```
VkResult vkAllocateDescriptorSets(  
    VkDevice device,  
    const VkDescriptorSetAllocateInfo* pAllocateInfo,  
    VkDescriptorSet* pDescriptorSets);
```

- `device` is the logical device that owns the descriptor pool.
- `pAllocateInfo` is a pointer to a `VkDescriptorSetAllocateInfo` structure describing parameters of the allocation.
- `pDescriptorSets` is a pointer to an array of `VkDescriptorSet` handles in which the resulting descriptor set objects are returned.

The allocated descriptor sets are returned in `pDescriptorSets`.

When a descriptor set is allocated, the initial state is largely uninitialized and all descriptors are undefined. Descriptors also become undefined if the underlying resource is destroyed. Descriptor sets containing undefined descriptors **can** still be bound and used, subject to the following conditions:

- For descriptor set bindings created with the `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT_EXT` bit set, all descriptors in that binding that are dynamically used **must** have been populated before the descriptor set is **consumed**.
- For descriptor set bindings created without the `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT_EXT`

bit set, all descriptors in that binding that are statically used **must** have been populated before the descriptor set is **consumed**.

- Descriptor bindings with descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` **can** be undefined when the descriptor set is **consumed**; though values in that block will be undefined.
- Entries that are not used by a pipeline **can** have undefined descriptors.

If a call to `vkAllocateDescriptorSets` would cause the total number of descriptor sets allocated from the pool to exceed the value of `VkDescriptorPoolCreateInfo::maxSets` used to create `pAllocateInfo->descriptorPool`, then the allocation **may** fail due to lack of space in the descriptor pool. Similarly, the allocation **may** fail due to lack of space if the call to `vkAllocateDescriptorSets` would cause the number of any given descriptor type to exceed the sum of all the `descriptorCount` members of each element of `VkDescriptorPoolCreateInfo::pPoolSizes` with a `member` equal to that type.

Additionally, the allocation **may** also fail if a call to `vkAllocateDescriptorSets` would cause the total number of inline uniform block bindings allocated from the pool to exceed the value of `VkDescriptorPoolInlineUniformBlockCreateInfoEXT::maxInlineUniformBlockBindings` used to create the descriptor pool.

If the allocation fails due to no more space in the descriptor pool, and not because of system or device memory exhaustion, then `VK_ERROR_OUT_OF_POOL_MEMORY` **must** be returned.

`vkAllocateDescriptorSets` **can** be used to create multiple descriptor sets. If the creation of any of those descriptor sets fails, then the implementation **must** destroy all successfully created descriptor set objects from this command, set all entries of the `pDescriptorSets` array to `VK_NULL_HANDLE` and return the error.

### Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pAllocateInfo` **must** be a valid pointer to a valid `VkDescriptorSetAllocateInfo` structure
- `pDescriptorSets` **must** be a valid pointer to an array of `pAllocateInfo::descriptorSetCount` `VkDescriptorSet` handles
- The value referenced by `pAllocateInfo::descriptorSetCount` **must** be greater than `0`

### Host Synchronization

- Host access to `pAllocateInfo::descriptorPool` **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_FRAGMENTED_POOL`
- `VK_ERROR_OUT_OF_POOL_MEMORY`

The `VkDescriptorSetAllocateInfo` structure is defined as:

```
typedef struct VkDescriptorSetAllocateInfo {
    VkStructureType           sType;
    const void*                pNext;
    VkDescriptorPool           descriptorPool;
    uint32_t                  descriptorSetCount;
    const VkDescriptorSetLayout* pSetLayouts;
} VkDescriptorSetAllocateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `descriptorPool` is the pool which the sets will be allocated from.
- `descriptorSetCount` determines the number of descriptor sets to be allocated from the pool.
- `pSetLayouts` is a pointer to an array of descriptor set layouts, with each member specifying how the corresponding descriptor set is allocated.

## Valid Usage

- Each element of `pSetLayouts` must not have been created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` set
- If any element of `pSetLayouts` was created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` bit set, `descriptorPool` must have been created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT` flag set

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_ALLOCATE_INFO`
- `pNext` **must** be `NULL` or a pointer to a valid instance of `VkDescriptorSetVariableDescriptorCountAllocateInfoEXT`
- `descriptorPool` **must** be a valid `VkDescriptorPool` handle
- `pSetLayouts` **must** be a valid pointer to an array of `descriptorSetCount` valid `VkDescriptorSetLayout` handles
- `descriptorSetCount` **must** be greater than `0`
- Both of `descriptorPool`, and the elements of `pSetLayouts` **must** have been created, allocated, or retrieved from the same `VkDevice`

If the `pNext` chain of a `VkDescriptorSetAllocateInfo` structure includes a `VkDescriptorSetVariableDescriptorCountAllocateInfoEXT` structure, then that structure includes an array of descriptor counts for variable descriptor count bindings, one for each descriptor set being allocated.

The `VkDescriptorSetVariableDescriptorCountAllocateInfoEXT` structure is defined as:

```
typedef struct VkDescriptorSetVariableDescriptorCountAllocateInfoEXT {  
    VkStructureType sType;  
    const void* pNext;  
    uint32_t descriptorSetCount;  
    const uint32_t* pDescriptorCounts;  
} VkDescriptorSetVariableDescriptorCountAllocateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `descriptorSetCount` is zero or the number of elements in `pDescriptorCounts`.
- `pDescriptorCounts` is a pointer to an array of descriptor counts, with each member specifying the number of descriptors in a variable descriptor count binding in the corresponding descriptor set being allocated.

If `descriptorSetCount` is zero or this structure is not included in the `pNext` chain, then the variable lengths are considered to be zero. Otherwise, `pDescriptorCounts[i]` is the number of descriptors in the variable count descriptor binding in the corresponding descriptor set layout. If the variable count descriptor binding in the corresponding descriptor set layout has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` then `pDescriptorCounts[i]` specifies the binding's capacity in bytes. If `VkDescriptorSetAllocateInfo::pSetLayouts[i]` does not include a variable count descriptor binding, then `pDescriptorCounts[i]` is ignored.

## Valid Usage

- If `descriptorSetCount` is not zero, `descriptorSetCount` **must** equal `VkDescriptorSetAllocateInfo::descriptorSetCount`
- If `VkDescriptorSetAllocateInfo::pSetLayouts[i]` has a variable descriptor count binding, then `pDescriptorCounts[i]` **must** be less than or equal to the descriptor count specified for that binding when the descriptor set layout was created.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_ALLOCATE_INFO_EXT`
- If `descriptorSetCount` is not `0`, `pDescriptorCounts` **must** be a valid pointer to an array of `descriptorSetCount uint32_t` values

To free allocated descriptor sets, call:

```
VkResult vkFreeDescriptorSets(  
    VkDevice device,  
    VkDescriptorPool descriptorPool,  
    uint32_t descriptorSetCount,  
    const VkDescriptorSet* pDescriptorSets);
```

- `device` is the logical device that owns the descriptor pool.
- `descriptorPool` is the descriptor pool from which the descriptor sets were allocated.
- `descriptorSetCount` is the number of elements in the `pDescriptorSets` array.
- `pDescriptorSets` is a pointer to an array of handles to `VkDescriptorSet` objects.

After calling `vkFreeDescriptorSets`, all descriptor sets in `pDescriptorSets` are invalid.

## Valid Usage

- All submitted commands that refer to any element of `pDescriptorSets` **must** have completed execution
- `pDescriptorSets` **must** be a valid pointer to an array of `descriptorSetCount VkDescriptorSet` handles, each element of which **must** either be a valid handle or `VK_NULL_HANDLE`
- Each valid handle in `pDescriptorSets` **must** have been allocated from `descriptorPool`
- `descriptorPool` **must** have been created with the `VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT` flag

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `descriptorPool` **must** be a valid `VkDescriptorPool` handle
- `descriptorSetCount` **must** be greater than `0`
- `descriptorPool` **must** have been created, allocated, or retrieved from `device`
- Each element of `pDescriptorSets` that is a valid handle **must** have been created, allocated, or retrieved from `descriptorPool`

## Host Synchronization

- Host access to `descriptorPool` **must** be externally synchronized
- Host access to each member of `pDescriptorSets` **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

To return all descriptor sets allocated from a given pool to the pool, rather than freeing individual descriptor sets, call:

```
VkResult vkResetDescriptorPool(  
    VkDevice                                     device,  
    VkDescriptorPool                            descriptorPool,  
    VkDescriptorPoolResetFlags                  flags);
```

- `device` is the logical device that owns the descriptor pool.
- `descriptorPool` is the descriptor pool to be reset.
- `flags` is reserved for future use.

Resetting a descriptor pool recycles all of the resources from all of the descriptor sets allocated from the descriptor pool back to the descriptor pool, and the descriptor sets are implicitly freed.

## Valid Usage

- All uses of `descriptorPool` (via any allocated descriptor sets) **must** have completed execution

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `descriptorPool` **must** be a valid `VkDescriptorPool` handle
- `flags` **must** be `0`
- `descriptorPool` **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `descriptorPool` **must** be externally synchronized
- Host access to any `VkDescriptorSet` objects allocated from `descriptorPool` **must** be externally synchronized

## Return Codes

### Success

- `VK_SUCCESS`

```
typedef VkFlags VkDescriptorPoolResetFlags;
```

`VkDescriptorPoolResetFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

### 13.2.4. Descriptor Set Updates

Once allocated, descriptor sets **can** be updated with a combination of write and copy operations. To update descriptor sets, call:

```
void vkUpdateDescriptorSets(  
    VkDevice                                     device,  
    uint32_t                                     descriptorWriteCount,  
    const VkWriteDescriptorSet*                  pDescriptorWrites,  
    uint32_t                                     descriptorCopyCount,  
    const VkCopyDescriptorSet*                  pDescriptorCopies);
```

- `device` is the logical device that updates the descriptor sets.
- `descriptorWriteCount` is the number of elements in the `pDescriptorWrites` array.
- `pDescriptorWrites` is a pointer to an array of `VkWriteDescriptorSet` structures describing the descriptor sets to write to.
- `descriptorCopyCount` is the number of elements in the `pDescriptorCopies` array.

- `pDescriptorCopies` is a pointer to an array of `VkCopyDescriptorSet` structures describing the descriptor sets to copy between.

The operations described by `pDescriptorWrites` are performed first, followed by the operations described by `pDescriptorCopies`. Within each array, the operations are performed in the order they appear in the array.

Each element in the `pDescriptorWrites` array describes an operation updating the descriptor set using descriptors for resources specified in the structure.

Each element in the `pDescriptorCopies` array is a `VkCopyDescriptorSet` structure describing an operation copying descriptors between sets.

If the `dstSet` member of any element of `pDescriptorWrites` or `pDescriptorCopies` is bound, accessed, or modified by any command that was recorded to a command buffer which is currently in the `recording` or `executable state`, and any of the descriptor bindings that are updated were not created with the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT` or `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT_EXT` bits set, that command buffer becomes invalid.

## Valid Usage

- Descriptor bindings updated by this command which were created without the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT` or `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT_EXT` bits set **must** not be used by any command that was recorded to a command buffer which is in the `pending state`.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `descriptorWriteCount` is not `0`, `pDescriptorWrites` **must** be a valid pointer to an array of `descriptorWriteCount` valid `VkWriteDescriptorSet` structures
- If `descriptorCopyCount` is not `0`, `pDescriptorCopies` **must** be a valid pointer to an array of `descriptorCopyCount` valid `VkCopyDescriptorSet` structures

## Host Synchronization

- Host access to `pDescriptorWrites[]`.`dstSet` **must** be externally synchronized
- Host access to `pDescriptorCopies[]`.`dstSet` **must** be externally synchronized

The `VkWriteDescriptorSet` structure is defined as:

```

typedef struct VkWriteDescriptorSet {
    VkStructureType           sType;
    const void*             pNext;
    VkDescriptorSet           dstSet;
    uint32_t                  dstBinding;
    uint32_t                  dstArrayElement;
    uint32_t                  descriptorCount;
    VkDescriptorType          descriptorType;
    const VkDescriptorImageInfo* pImageInfo;
    const VkDescriptorBufferInfo* pBufferInfo;
    const VkBufferView*       pTexelBufferView;
} VkWriteDescriptorSet;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **dstSet** is the destination descriptor set to update.
- **dstBinding** is the descriptor binding within that set.
- **dstArrayElement** is the starting element in that array. If the descriptor binding identified by **dstSet** and **dstBinding** has a descriptor type of **VK\_DESCRIPTOR\_TYPE\_INLINE\_UNIFORM\_BLOCK\_EXT** then **dstArrayElement** specifies the starting byte offset within the binding.
- **descriptorCount** is the number of descriptors to update (the number of elements in **pImageInfo**, **pBufferInfo**, or **pTexelBufferView**, or a value matching the **dataSize** member of an instance of **VkWriteDescriptorSetInlineUniformBlockEXT** in the **pNext** chain, or a value matching the **accelerationStructureCount** of an instance of **VkWriteDescriptorSetAccelerationStructureNV** in the **pNext** chain). If the descriptor binding identified by **dstSet** and **dstBinding** has a descriptor type of **VK\_DESCRIPTOR\_TYPE\_INLINE\_UNIFORM\_BLOCK\_EXT** then **descriptorCount** specifies the number of bytes to update.
- **descriptorType** is a **VkDescriptorType** specifying the type of each descriptor in **pImageInfo**, **pBufferInfo**, or **pTexelBufferView**, as described below. It **must** be the same type as that specified in **VkDescriptorSetLayoutBinding** for **dstSet** at **dstBinding**. The type of the descriptor also controls which array the descriptors are taken from.
- **pImageInfo** is a pointer to an array of **VkDescriptorImageInfo** structures or is ignored, as described below.
- **pBufferInfo** is a pointer to an array of **VkDescriptorBufferInfo** structures or is ignored, as described below.
- **pTexelBufferView** is a pointer to an array of **VkBufferView** handles as described in the **Buffer Views** section or is ignored, as described below.

Only one of **pImageInfo**, **pBufferInfo**, or **pTexelBufferView** members is used according to the descriptor type specified in the **descriptorType** member of the containing **VkWriteDescriptorSet** structure, or none of them in case **descriptorType** is **VK\_DESCRIPTOR\_TYPE\_INLINE\_UNIFORM\_BLOCK\_EXT**, in which case the source data for the descriptor writes is taken from the instance of **VkWriteDescriptorSetInlineUniformBlockEXT** in the **pNext** chain of **VkWriteDescriptorSet**, or if **descriptorType** is **VK\_DESCRIPTOR\_TYPE\_ACCELERATION\_STRUCTURE\_NV**, in which case the source data for

the descriptor writes is taken from the instance of `VkWriteDescriptorSetAccelerationStructureNV` in the `pNext` chain of `VkWriteDescriptorSet`, as specified below.

If the `dstBinding` has fewer than `descriptorCount` array elements remaining starting from `dstArrayElement`, then the remainder will be used to update the subsequent binding - `dstBinding+1` starting at array element zero. If a binding has a `descriptorCount` of zero, it is skipped. This behavior applies recursively, with the update affecting consecutive bindings as needed to update all `descriptorCount` descriptors.

*Note*

The same behavior applies to bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` where `descriptorCount` specifies the number of bytes to update while `dstArrayElement` specifies the starting byte offset, thus in this case if the `dstBinding` has a smaller byte size than the sum of `dstArrayElement` and `descriptorCount`, then the remainder will be used to update the subsequent binding - `dstBinding+1` starting at offset zero. This falls out as a special case of the above rule.

## Valid Usage

- `dstBinding` **must** be less than or equal to the maximum value of `binding` of all `VkDescriptorSetLayoutBinding` structures specified when `dstSet`'s descriptor set layout was created
- `dstBinding` **must** be a binding with a non-zero `descriptorCount`
- All consecutive bindings updated via a single `VkWriteDescriptorSet` structure, except those with a `descriptorCount` of zero, **must** have identical `descriptorType` and `stageFlags`.
- All consecutive bindings updated via a single `VkWriteDescriptorSet` structure, except those with a `descriptorCount` of zero, **must** all either use immutable samplers or **must** all not use immutable samplers.
- `descriptorType` **must** match the type of `dstBinding` within `dstSet`
- `dstSet` **must** be a valid `VkDescriptorSet` handle
- The sum of `dstArrayElement` and `descriptorCount` **must** be less than or equal to the number of array elements in the descriptor set binding specified by `dstBinding`, and all applicable consecutive bindings, as described by `consecutive binding updates`
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, `dstArrayElement` **must** be an integer multiple of 4
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, `descriptorCount` **must** be an integer multiple of 4
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, `pImageInfo` **must** be a valid pointer to an array of `descriptorCount` valid `VkDescriptorImageInfo` structures
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, `pTexelBufferView` **must** be a valid pointer to an array of `descriptorCount` valid `VkBufferView` handles
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, `pBufferInfo` **must** be a valid pointer to an array of `descriptorCount` valid `VkDescriptorBufferInfo` structures
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `dstSet` was not allocated with a layout that included immutable samplers for `dstBinding` with `descriptorType`, the `sampler` member of each element of `pImageInfo` **must** be a valid `VkSampler` object
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, the `imageView` and `imageLayout` members of each element of `pImageInfo` **must** be a valid `VkImageView` and `VkImageLayout`, respectively
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, the `pNext` chain **must** include a `VkWriteDescriptorSetInlineUniformBlockEXT` structure whose `dataSize`

member equals `descriptorCount`

- If `descriptorType` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV`, the `pNext` chain **must** include a `VkWriteDescriptorSetAccelerationStructureNV` structure whose `accelerationStructureCount` member equals `descriptorCount`
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, then the `imageView` member of each `pImageInfo` element **must** have been created without a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and if any element of `pImageInfo` has a `imageView` member that was created with a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain, then `dstSet` **must** have been allocated with a layout that included immutable samplers for `dstBinding`, and the corresponding immutable sampler **must** have been created with an *identically defined* `VkSamplerYcbcrConversionInfo` object
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `dstSet` was allocated with a layout that included immutable samplers for `dstBinding`, then the `imageView` member of each element of `pImageInfo` which corresponds to an immutable sampler that enables sampler Y'CbCr conversion **must** have been created with a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain with an *identically defined* `VkSamplerYcbcrConversionInfo` to the corresponding immutable sampler
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, for each descriptor that will be accessed via load or store operations the `imageLayout` member for corresponding elements of `pImageInfo` **must** be `VK_IMAGE_LAYOUT_GENERAL`
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` **must** be a multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` **must** be a multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, and the `buffer` member of any element of `pBufferInfo` is the handle of a non-sparse buffer, then that buffer **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `buffer` member of each element of `pBufferInfo` **must** have been created with `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` set
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `buffer` member of each element of `pBufferInfo` **must** have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` set
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `range` member of each element of `pBufferInfo`, or the effective range if `range` is `VK_WHOLE_SIZE`, **must** be less than or equal to

### VkPhysicalDeviceLimits::maxUniformBufferRange

- If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `range` member of each element of `pBufferInfo`, or the effective range if `range` is `VK_WHOLE_SIZE`, **must** be less than or equal to `VkPhysicalDeviceLimits::maxStorageBufferRange`
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`, the `VkBuffer` that each element of `pTexelBufferView` was created from **must** have been created with `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT` set
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, the `VkBuffer` that each element of `pTexelBufferView` was created from **must** have been created with `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT` set
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, the `imageView` member of each element of `pImageInfo` **must** have been created with the identity swizzle
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, the `imageView` member of each element of `pImageInfo` **must** have been created with `VK_IMAGE_USAGE_SAMPLED_BIT` set
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, the `imageLayout` member of each element of `pImageInfo` **must** be a member of the list given in [Sampled Image](#) or [Combined Image Sampler](#), corresponding to its type
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, the `imageView` member of each element of `pImageInfo` **must** have been created with `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` set
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, the `imageView` member of each element of `pImageInfo` **must** have been created with `VK_IMAGE_USAGE_STORAGE_BIT` set
- All consecutive bindings updated via a single `VkWriteDescriptorSet` structure, except those with a `descriptorCount` of zero, **must** have identical `VkDescriptorBindingFlagBitsEXT`.
- If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER`, then `dstSet` **must** not have been allocated with a layout that included immutable samplers for `dstBinding`

## Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET`
- Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkWriteDescriptorSetAccelerationStructureNV` or `VkWriteDescriptorSetInlineUniformBlockEXT`
- Each `sType` member in the `pNext` chain must be unique
- `descriptorType` must be a valid `VkDescriptorType` value
- `descriptorCount` must be greater than `0`
- Both of `dstSet`, and the elements of `pTexelBufferView` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

The type of descriptors in a descriptor set is specified by `VkWriteDescriptorSet::descriptorType`, which must be one of the values:

```
typedef enum VkDescriptorType {
    VK_DESCRIPTOR_TYPE_SAMPLER = 0,
    VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER = 1,
    VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE = 2,
    VK_DESCRIPTOR_TYPE_STORAGE_IMAGE = 3,
    VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER = 4,
    VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER = 5,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER = 6,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER = 7,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC = 8,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC = 9,
    VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT = 10,
    VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT = 1000138000,
    VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV = 1000165000,
    VK_DESCRIPTOR_TYPE_MAX_ENUM = 0x7FFFFFFF
} VkDescriptorType;
```

- `VK_DESCRIPTOR_TYPE_SAMPLER` specifies a [sampler descriptor](#).
- `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` specifies a [combined image sampler descriptor](#).
- `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` specifies a [sampled image descriptor](#).
- `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` specifies a [storage image descriptor](#).
- `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` specifies a [uniform texel buffer descriptor](#).
- `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` specifies a [storage texel buffer descriptor](#).
- `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` specifies a [uniform buffer descriptor](#).
- `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` specifies a [storage buffer descriptor](#).
- `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` specifies a [dynamic uniform buffer descriptor](#).

- `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` specifies a [dynamic storage buffer descriptor](#).
- `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` specifies an [input attachment descriptor](#).
- `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` specifies an [inline uniform block](#).

When a descriptor set is updated via elements of `VkWriteDescriptorSet`, members of `pImageInfo`, `pBufferInfo` and `pTexelBufferView` are only accessed by the implementation when they correspond to descriptor type being defined - otherwise they are ignored. The members accessed are as follows for each descriptor type:

- For `VK_DESCRIPTOR_TYPE_SAMPLER`, only the `sampler` member of each element of `VkWriteDescriptorSet::pImageInfo` is accessed.
- For `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, only the `imageView` and `imageLayout` members of each element of `VkWriteDescriptorSet::pImageInfo` are accessed.
- For `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, all members of each element of `VkWriteDescriptorSet::pImageInfo` are accessed.
- For `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, all members of each element of `VkWriteDescriptorSet::pBufferInfo` are accessed.
- For `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, each element of `VkWriteDescriptorSet::pTexelBufferView` is accessed.

When updating descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, none of the `pImageInfo`, `pBufferInfo`, or `pTexelBufferView` members are accessed, instead the source data of the descriptor update operation is taken from the instance of `VkWriteDescriptorSetInlineUniformBlockEXT` in the `pNext` chain of `VkWriteDescriptorSet`. When updating descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV`, none of the `pImageInfo`, `pBufferInfo`, or `pTexelBufferView` members are accessed, instead the source data of the descriptor update operation is taken from the instance of `VkWriteDescriptorSetAccelerationStructureNV` in the `pNext` chain of `VkWriteDescriptorSet`.

The `VkDescriptorBufferInfo` structure is defined as:

```
typedef struct VkDescriptorBufferInfo {
    VkBuffer        buffer;
    VkDeviceSize    offset;
    VkDeviceSize    range;
} VkDescriptorBufferInfo;
```

- `buffer` is the buffer resource.
- `offset` is the offset in bytes from the start of `buffer`. Access to buffer memory via this descriptor uses addressing that is relative to this starting offset.
- `range` is the size in bytes that is used for this descriptor update, or `VK_WHOLE_SIZE` to use the range from `offset` to the end of the buffer.

*Note*

When setting `range` to `VK_WHOLE_SIZE`, the effective range **must** not be larger than the maximum range for the descriptor type (`maxUniformBufferRange` or `maxStorageBufferRange`). This means that `VK_WHOLE_SIZE` is not typically useful in the common case where uniform buffer descriptors are suballocated from a buffer that is much larger than `maxUniformBufferRange`.

For `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` descriptor types, `offset` is the base offset from which the dynamic offset is applied and `range` is the static size used for all dynamic offsets.

### Valid Usage

- `offset` **must** be less than the size of `buffer`
- If `range` is not equal to `VK_WHOLE_SIZE`, `range` **must** be greater than `0`
- If `range` is not equal to `VK_WHOLE_SIZE`, `range` **must** be less than or equal to the size of `buffer` minus `offset`

### Valid Usage (Implicit)

- `buffer` **must** be a valid `VkBuffer` handle

The `VkDescriptorImageInfo` structure is defined as:

```
typedef struct VkDescriptorImageInfo {  
    VkSampler      sampler;  
    VkImageView    imageView;  
    VkImageLayout  imageLayout;  
} VkDescriptorImageInfo;
```

- `sampler` is a sampler handle, and is used in descriptor updates for types `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` if the binding being updated does not use immutable samplers.
- `imageView` is an image view handle, and is used in descriptor updates for types `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`.
- `imageLayout` is the layout that the image subresources accessible from `imageView` will be in at the time this descriptor is accessed. `imageLayout` is used in descriptor updates for types `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`.

Members of `VkDescriptorImageInfo` that are not used in an update (as described above) are ignored.

## Valid Usage

- `imageView` **must** not be 2D or 2D array image view created from a 3D image
- If `imageView` is created from a depth/stencil image, the `aspectMask` used to create the `imageView` **must** include either `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` but not both.
- `imageLayout` **must** match the actual `VkImageLayout` of each subresource accessible from `imageView` at the time this descriptor is accessed as defined by the `image layout matching rules`
- If `sampler` is used and the `VkFormat` of the image is a `multi-planar format`, the image **must** have been created with `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, and the `aspectMask` of the `imageView` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or (for three-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`

## Valid Usage (Implicit)

- Both of `imageView`, and `sampler` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

If the `descriptorType` member of `VkWriteDescriptorSet` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` then the data to write to the descriptor set is specified through an instance of `VkWriteDescriptorSetInlineUniformBlockEXT` chained to the `pNext` chain of `VkWriteDescriptorSet`.

The `VkWriteDescriptorSetInlineUniformBlockEXT` structure is defined as:

```
typedef struct VkWriteDescriptorSetInlineUniformBlockEXT {
    VkStructureType sType;
    const void*     pNext;
    uint32_t        dataSize;
    const void*     pData;
} VkWriteDescriptorSetInlineUniformBlockEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `dataSize` is the number of bytes of inline uniform block data pointed to by `pData`.
- `pData` is a pointer to `dataSize` number of bytes of data to write to the inline uniform block.

## Valid Usage

- `dataSize` **must** be an integer multiple of 4

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_INLINE_UNIFORM_BLOCK_EXT`
- `pData` **must** be a valid pointer to an array of `dataSize` bytes
- `dataSize` **must** be greater than `0`

The `VkWriteDescriptorSetAccelerationStructureNV` structure is defined as:

```
typedef struct VkWriteDescriptorSetAccelerationStructureNV {  
    VkStructureType           sType;  
    const void*                pNext;  
    uint32_t                  accelerationStructureCount;  
    const VkAccelerationStructureNV* pAccelerationStructures;  
} VkWriteDescriptorSetAccelerationStructureNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `accelerationStructureCount` is the number of elements in `pAccelerationStructures`.
- `pAccelerationStructures` are the acceleration structures to update.

## Valid Usage

- `accelerationStructureCount` **must** be equal to `descriptorCount` in the extended structure
- Each acceleration structure in `pAccelerationStructures` must have been created with `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_NV`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_NV`
- `pAccelerationStructures` **must** be a valid pointer to an array of `accelerationStructureCount` valid `VkAccelerationStructureNV` handles
- `accelerationStructureCount` **must** be greater than `0`

The `VkCopyDescriptorSet` structure is defined as:

```

typedef struct VkCopyDescriptorSet {
    VkStructureType      sType;
    const void*        pNext;
    VkDescriptorSet      srcSet;
    uint32_t             srcBinding;
    uint32_t             srcArrayElement;
    VkDescriptorSet      dstSet;
    uint32_t             dstBinding;
    uint32_t             dstArrayElement;
    uint32_t             descriptorCount;
} VkCopyDescriptorSet;

```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **srcSet**, **srcBinding**, and **srcArrayElement** are the source set, binding, and array element, respectively. If the descriptor binding identified by **srcSet** and **srcBinding** has a descriptor type of **VK\_DESCRIPTOR\_TYPE\_INLINE\_UNIFORM\_BLOCK\_EXT** then **srcArrayElement** specifies the starting byte offset within the binding to copy from.
- **dstSet**, **dstBinding**, and **dstArrayElement** are the destination set, binding, and array element, respectively. If the descriptor binding identified by **dstSet** and **dstBinding** has a descriptor type of **VK\_DESCRIPTOR\_TYPE\_INLINE\_UNIFORM\_BLOCK\_EXT** then **dstArrayElement** specifies the starting byte offset within the binding to copy to.
- **descriptorCount** is the number of descriptors to copy from the source to destination. If **descriptorCount** is greater than the number of remaining array elements in the source or destination binding, those affect consecutive bindings in a manner similar to **VkWriteDescriptorSet** above. If the descriptor binding identified by **srcSet** and **srcBinding** has a descriptor type of **VK\_DESCRIPTOR\_TYPE\_INLINE\_UNIFORM\_BLOCK\_EXT** then **descriptorCount** specifies the number of bytes to copy and the remaining array elements in the source or destination binding refer to the remaining number of bytes in those.

## Valid Usage

- `srcBinding` **must** be a valid binding within `srcSet`
- The sum of `srcArrayElement` and `descriptorCount` **must** be less than or equal to the number of array elements in the descriptor set binding specified by `srcBinding`, and all applicable consecutive bindings, as described by [consecutive binding updates](#)
- `dstBinding` **must** be a valid binding within `dstSet`
- The sum of `dstArrayElement` and `descriptorCount` **must** be less than or equal to the number of array elements in the descriptor set binding specified by `dstBinding`, and all applicable consecutive bindings, as described by [consecutive binding updates](#)
- The type of `dstBinding` within `dstSet` **must** be equal to the type of `srcBinding` within `srcSet`
- If `srcSet` is equal to `dstSet`, then the source and destination ranges of descriptors **must** not overlap, where the ranges **may** include array elements from consecutive bindings as described by [consecutive binding updates](#)
- If the descriptor type of the descriptor set binding specified by `srcBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, `srcArrayElement` **must** be an integer multiple of 4
- If the descriptor type of the descriptor set binding specified by `dstBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, `dstArrayElement` **must** be an integer multiple of 4
- If the descriptor type of the descriptor set binding specified by either `srcBinding` or `dstBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, `descriptorCount` **must** be an integer multiple of 4
- If `srcSet`'s layout was created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` flag set, then `dstSet`'s layout **must** also have been created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` flag set
- If `srcSet`'s layout was created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` flag set, then `dstSet`'s layout **must** also have been created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT` flag set
- If the descriptor pool from which `srcSet` was allocated was created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT` flag set, then the descriptor pool from which `dstSet` was allocated **must** also have been created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT` flag set
- If the descriptor pool from which `srcSet` was allocated was created without the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT` flag set, then the descriptor pool from which `dstSet` was allocated **must** also have been created without the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT` flag set
- If the descriptor type of the descriptor set binding specified by `dstBinding` is `VK_DESCRIPTOR_TYPE_SAMPLER`, then `dstSet` **must** not have been allocated with a layout that included immutable samplers for `dstBinding`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_COPY_DESCRIPTOR_SET`
- `pNext` **must** be `NULL`
- `srcSet` **must** be a valid `VkDescriptorSet` handle
- `dstSet` **must** be a valid `VkDescriptorSet` handle
- Both of `dstSet`, and `srcSet` **must** have been created, allocated, or retrieved from the same `VkDevice`

### 13.2.5. Descriptor Update Templates

A descriptor update template specifies a mapping from descriptor update information in host memory to descriptors in a descriptor set. It is designed to avoid passing redundant information to the driver when frequently updating the same set of descriptors in descriptor sets.

Descriptor update template objects are represented by `VkDescriptorUpdateTemplate` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorUpdateTemplate)
```

or the equivalent

```
typedef VkDescriptorUpdateTemplate VkDescriptorUpdateTemplateKHR;
```

### 13.2.6. Descriptor Set Updates with Templates

Updating a large `VkDescriptorSet` array **can** be an expensive operation since an application **must** specify one `VkWriteDescriptorSet` structure for each descriptor or descriptor array to update, each of which re-specifies the same state when updating the same descriptor in multiple descriptor sets. For cases when an application wishes to update the same set of descriptors in multiple descriptor sets allocated using the same `VkDescriptorSetLayout`, `vkUpdateDescriptorSetWithTemplate` **can** be used as a replacement for `vkUpdateDescriptorSets`.

`VkDescriptorUpdateTemplate` allows implementations to convert a set of descriptor update operations on a single descriptor set to an internal format that, in conjunction with `vkUpdateDescriptorSetWithTemplate` or `vkCmdPushDescriptorSetWithTemplateKHR`, **can** be more efficient compared to calling `vkUpdateDescriptorSets` or `vkCmdPushDescriptorSetKHR`. The descriptors themselves are not specified in the `VkDescriptorUpdateTemplate`, rather, offsets into an application provided pointer to host memory are specified, which are combined with a pointer passed to `vkUpdateDescriptorSetWithTemplate` or `vkCmdPushDescriptorSetWithTemplateKHR`. This allows large batches of updates to be executed without having to convert application data structures into a strictly-defined Vulkan data structure.

To create a descriptor update template, call:

```
VkResult vkCreateDescriptorUpdateTemplate(  
    VkDevice                                     device,  
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks*                  pAllocator,  
    VkDescriptorUpdateTemplate*                  pDescriptorUpdateTemplate);
```

or the equivalent command

```
VkResult vkCreateDescriptorUpdateTemplateKHR(  
    VkDevice                                     device,  
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks*                  pAllocator,  
    VkDescriptorUpdateTemplate*                  pDescriptorUpdateTemplate);
```

- **device** is the logical device that creates the descriptor update template.
- **pCreateInfo** is a pointer to a `VkDescriptorUpdateTemplateCreateInfo` structure specifying the set of descriptors to update with a single call to `vkCmdPushDescriptorSetWithTemplateKHR` or `vkUpdateDescriptorSetWithTemplate`.
- **pAllocator** controls host memory allocation as described in the [Memory Allocation](#) chapter.
- **pDescriptorUpdateTemplate** is a pointer to a `VkDescriptorUpdateTemplate` handle in which the resulting descriptor update template object is returned.

## Valid Usage (Implicit)

- **device** **must** be a valid `VkDevice` handle
- **pCreateInfo** **must** be a valid pointer to a valid `VkDescriptorUpdateTemplateCreateInfo` structure
- If **pAllocator** is not `NULL`, **pAllocator** **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- **pDescriptorUpdateTemplate** **must** be a valid pointer to a `VkDescriptorUpdateTemplate` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDescriptorUpdateTemplateCreateInfo` structure is defined as:

```

typedef struct VkDescriptorUpdateTemplateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorUpdateTemplateCreateFlags flags;
    uint32_t descriptorUpdateEntryCount;
    const VkDescriptorUpdateTemplateEntry* pDescriptorUpdateEntries;
    VkDescriptorUpdateTemplateType templateType;
    VkDescriptorSetLayout descriptorSetLayout;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipelineLayout pipelineLayout;
    uint32_t set;
} VkDescriptorUpdateTemplateCreateInfo;

```

or the equivalent

```
typedef VkDescriptorUpdateTemplateCreateInfo VkDescriptorUpdateTemplateCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to an extension-specific structure.
- **flags** is reserved for future use.
- **descriptorUpdateEntryCount** is the number of elements in the **pDescriptorUpdateEntries** array.
- **pDescriptorUpdateEntries** is a pointer to an array of **VkDescriptorUpdateTemplateEntry** structures describing the descriptors to be updated by the descriptor update template.
- **templateType** Specifies the type of the descriptor update template. If set to **VK\_DESCRIPTOR\_UPDATE\_TEMPLATE\_TYPE\_DESCRIPTOR\_SET** it **can** only be used to update descriptor sets with a fixed **descriptorsetLayout**. If set to **VK\_DESCRIPTOR\_UPDATE\_TEMPLATE\_TYPE\_PUSH\_DESCRIPTORS\_KHR** it **can** only be used to push descriptor sets using the provided **pipelineBindPoint**, **pipelineLayout**, and **set** number.
- **descriptorsetLayout** is the descriptor set layout the parameter update template will be used with. All descriptor sets which are going to be updated through the newly created descriptor update template **must** be created with this layout. **descriptorsetLayout** is the descriptor set layout used to build the descriptor update template. All descriptor sets which are going to be updated through the newly created descriptor update template **must** be created with a layout that matches (is the same as, or defined identically to) this layout. This parameter is ignored if **templateType** is not **VK\_DESCRIPTOR\_UPDATE\_TEMPLATE\_TYPE\_DESCRIPTOR\_SET**.
- **pipelineBindPoint** is a **VkPipelineBindPoint** indicating whether the descriptors will be used by graphics pipelines or compute pipelines. This parameter is ignored if **templateType** is not **VK\_DESCRIPTOR\_UPDATE\_TEMPLATE\_TYPE\_PUSH\_DESCRIPTORS\_KHR**
- **pipelineLayout** is a **VkPipelineLayout** object used to program the bindings. This parameter is ignored if **templateType** is not **VK\_DESCRIPTOR\_UPDATE\_TEMPLATE\_TYPE\_PUSH\_DESCRIPTORS\_KHR**
- **set** is the set number of the descriptor set in the pipeline layout that will be updated. This parameter is ignored if **templateType** is not **VK\_DESCRIPTOR\_UPDATE\_TEMPLATE\_TYPE\_PUSH\_DESCRIPTORS\_KHR**

## Valid Usage

- If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET`, `descriptorSetLayout` **must** be a valid `VkDescriptorSetLayout` handle
- If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`, `pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value
- If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`, `pipelineLayout` **must** be a valid `VkPipelineLayout` handle
- If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`, `set` **must** be the unique set number in the pipeline layout that uses a descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO`
- `pNext` **must** be `NULL`
- `flags` **must** be `0`
- `pDescriptorUpdateEntries` **must** be a valid pointer to an array of `descriptorUpdateEntryCount` valid `VkDescriptorUpdateTemplateEntry` structures
- `templateType` **must** be a valid `VkDescriptorUpdateTemplateType` value
- `descriptorUpdateEntryCount` **must** be greater than `0`
- Both of `descriptorSetLayout`, and `pipelineLayout` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

```
typedef VkFlags VkDescriptorUpdateTemplateCreateFlags;
```

or the equivalent

```
typedef VkDescriptorUpdateTemplateCreateFlags  
VkDescriptorUpdateTemplateCreateFlagsKHR;
```

`VkDescriptorUpdateTemplateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The descriptor update template type is determined by the `VkDescriptorUpdateTemplateCreateInfo` `::templateType` property, which takes the following values:

```

typedef enum VkDescriptorUpdateTemplateType {
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET = 0,
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR = 1,
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET_KHR =
VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET,
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_MAX_ENUM = 0x7FFFFFFF
} VkDescriptorUpdateTemplateType;

```

or the equivalent

```
typedef VkDescriptorUpdateTemplateType VkDescriptorUpdateTemplateTypeKHR;
```

- **VK\_DESCRIPTOR\_UPDATE\_TEMPLATE\_TYPE\_DESCRIPTOR\_SET** specifies that the descriptor update template will be used for descriptor set updates only.
- **VK\_DESCRIPTOR\_UPDATE\_TEMPLATE\_TYPE\_PUSH\_DESCRIPTORS\_KHR** specifies that the descriptor update template will be used for push descriptor updates only.

The **VkDescriptorUpdateTemplateEntry** structure is defined as:

```

typedef struct VkDescriptorUpdateTemplateEntry {
    uint32_t          dstBinding;
    uint32_t          dstArrayElement;
    uint32_t          descriptorCount;
    VkDescriptorType  descriptorType;
    size_t            offset;
    size_t            stride;
} VkDescriptorUpdateTemplateEntry;

```

or the equivalent

```
typedef VkDescriptorUpdateTemplateEntry VkDescriptorUpdateTemplateEntryKHR;
```

- **dstBinding** is the descriptor binding to update when using this descriptor update template.
- **dstArrayElement** is the starting element in the array belonging to **dstBinding**. If the descriptor binding identified by **srcBinding** has a descriptor type of **VK\_DESCRIPTOR\_TYPE\_INLINE\_UNIFORM\_BLOCK\_EXT** then **dstArrayElement** specifies the starting byte offset to update.
- **descriptorCount** is the number of descriptors to update. If **descriptorCount** is greater than the number of remaining array elements in the destination binding, those affect consecutive bindings in a manner similar to **VkWriteDescriptorSet** above. If the descriptor binding identified by **dstBinding** has a descriptor type of **VK\_DESCRIPTOR\_TYPE\_INLINE\_UNIFORM\_BLOCK\_EXT** then **descriptorCount** specifies the number of bytes to update and the remaining array elements in the destination binding refer to the remaining number of bytes in it.
- **descriptorType** is a **VkDescriptorType** specifying the type of the descriptor.

- **offset** is the offset in bytes of the first binding in the raw data structure.
- **stride** is the stride in bytes between two consecutive array elements of the descriptor update informations in the raw data structure. The actual pointer ptr for each array element j of update entry i is computed using the following formula:

```
const char *ptr = (const char *)pData + pDescriptorUpdateEntries[i].offset + j
* pDescriptorUpdateEntries[i].stride
```

The stride is useful in case the bindings are stored in structs along with other data. If **descriptorType** is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT` then the value of **stride** is ignored and the stride is assumed to be `1`, i.e. the descriptor update information for them is always specified as a contiguous range.

## Valid Usage

- **dstBinding** **must** be a valid binding in the descriptor set layout implicitly specified when using a descriptor update template to update descriptors.
- **dstArrayElement** and **descriptorCount** **must** be less than or equal to the number of array elements in the descriptor set binding implicitly specified when using a descriptor update template to update descriptors, and all applicable consecutive bindings, as described by [consecutive binding updates](#)
- If **descriptor** type is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, **dstArrayElement** **must** be an integer multiple of `4`
- If **descriptor** type is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`, **descriptorCount** **must** be an integer multiple of `4`

## Valid Usage (Implicit)

- **descriptorType** **must** be a valid `VkDescriptorType` value

To destroy a descriptor update template, call:

```
void vkDestroyDescriptorUpdateTemplate(
    VkDevice                                     device,
    VkDescriptorUpdateTemplate                  descriptorUpdateTemplate,
    const VkAllocationCallbacks* pAllocator);
```

or the equivalent command

```
void vkDestroyDescriptorUpdateTemplateKHR(  
    VkDevice device,  
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that has been used to create the descriptor update template
- `descriptorUpdateTemplate` is the descriptor update template to destroy.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- If `VkAllocationCallbacks` were provided when `descriptorsetLayout` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `descriptorsetLayout` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `descriptorUpdateTemplate` is not `VK_NULL_HANDLE`, `descriptorUpdateTemplate` **must** be a valid `VkDescriptorUpdateTemplate` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `descriptorUpdateTemplate` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `descriptorUpdateTemplate` **must** be externally synchronized

Once a `VkDescriptorUpdateTemplate` has been created, descriptor sets **can** be updated by calling:

```
void vkUpdateDescriptorSetWithTemplate(  
    VkDevice device,  
    VkDescriptorSet descriptorSet,  
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,  
    const void* pData);
```

or the equivalent command

```
void vkUpdateDescriptorSetWithTemplateKHR(
    VkDevice                                     device,
    VkDescriptorSet                             descriptorSet,
    VkDescriptorUpdateTemplate                 descriptorUpdateTemplate,
    const void*                                 pData);
```

- `device` is the logical device that updates the descriptor sets.
- `descriptorSet` is the descriptor set to update
- `descriptorUpdateTemplate` is a `VkDescriptorUpdateTemplate` object specifying the update mapping between `pData` and the descriptor set to update.
- `pData` is a pointer to memory containing one or more `VkDescriptorImageInfo`, `VkDescriptorBufferInfo`, or `VkBufferView` structures used to write the descriptors.

## Valid Usage

- `pData` **must** be a valid pointer to a memory containing one or more valid instances of `VkDescriptorImageInfo`, `VkDescriptorBufferInfo`, or `VkBufferView` in a layout defined by `descriptorUpdateTemplate` when it was created with `vkCreateDescriptorUpdateTemplate`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `descriptorSet` **must** be a valid `VkDescriptorSet` handle
- `descriptorUpdateTemplate` **must** be a valid `VkDescriptorUpdateTemplate` handle
- `descriptorUpdateTemplate` **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `descriptorSet` **must** be externally synchronized

*API example*

```
struct AppBufferView {
    VkBufferView bufferView;
    uint32_t     applicationRelatedInformation;
};

struct AppDataStructure
{
    VkDescriptorImageInfo   imageInfo;           // a single image info
    VkDescriptorBufferInfo bufferInfoArray[3]; // 3 buffer infos in an array
    AppBufferView          bufferView[2];        // An application defined structure
```

```

containing a bufferView
    // ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] =
{
    // binding to a single image descriptor
    {
        0,                                // binding
        0,                                // dstArrayElement
        1,                                // descriptorCount
        VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, // descriptorType
        offsetof(AppDataStructure, imageInfo),   // offset
        0                                   // stride is not required if
descriptorCount is 1
    },

    // binding to an array of buffer descriptors
    {
        1,                                // binding
        0,                                // dstArrayElement
        3,                                // descriptorCount
        VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, // descriptorType
        offsetof(AppDataStructure, bufferInfoArray), // offset
        sizeof(VkDescriptorBufferInfo)           // stride, descriptor buffer
infos are compact
    },

    // binding to an array of buffer views
    {
        2,                                // binding
        0,                                // dstArrayElement
        2,                                // descriptorCount
        VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, // descriptorType
        offsetof(AppDataStructure, bufferView) + // offset
            offsetof(AppBufferView, bufferView), // stride
        sizeof(AppBufferView)                // stride, bufferViews do not
have to be compact
    },
};

// create a descriptor update template for descriptor set updates
const VkDescriptorUpdateTemplateCreateInfo createInfo =
{
    VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO, // sType
    NULL,                                         // pNext
    0,                                            // flags
    3,                                            // /
descriptorUpdateEntryCount
    descriptorUpdateTemplateEntries,               // /
pDescriptorUpdateEntries
};

```

```

VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET,           // templateType
myLayout,                                                 // descriptorSetLayout
0,                                                       // pipelineBindPoint,
ignored by given templateType
0,                                                       // pipelineLayout,
ignored by given templateType
0,                                                       // set, ignored by
given templateType
};

VkDescriptorUpdateTemplate myDescriptorUpdateTemplate;
myResult = vkCreateDescriptorUpdateTemplate(
    myDevice,
    &CreateInfo,
    NULL,
    &myDescriptorUpdateTemplate);
}

```

AppDataStructure appData;

```

// fill appData here or cache it in your engine
vkUpdateDescriptorSetWithTemplate(myDevice, myDescriptorSet,
myDescriptorUpdateTemplate, &appData);

```

### 13.2.7. Descriptor Set Binding

To bind one or more descriptor sets to a command buffer, call:

```

void vkCmdBindDescriptorSets(
    VkCommandBuffer
    VkPipelineBindPoint
    VkPipelineLayout
    uint32_t
    uint32_t
    const VkDescriptorSet*
    uint32_t
    const uint32_t*
    commandBuffer,
    pipelineBindPoint,
    layout,
    firstSet,
    descriptorSetCount,
    pDescriptorSets,
    dynamicOffsetCount,
    pDynamicOffsets);

```

- **commandBuffer** is the command buffer that the descriptor sets will be bound to.
- **pipelineBindPoint** is a [VkPipelineBindPoint](#) indicating whether the descriptors will be used by graphics pipelines or compute pipelines. There is a separate set of bind points for each of graphics and compute, so binding one does not disturb the other.
- **layout** is a [VkPipelineLayout](#) object used to program the bindings.
- **firstSet** is the set number of the first descriptor set to be bound.
- **descriptorSetCount** is the number of elements in the **pDescriptorSets** array.
- **pDescriptorSets** is a pointer to an array of handles to [VkDescriptorSet](#) objects describing the

descriptor sets to write to.

- `dynamicOffsetCount` is the number of dynamic offsets in the `pDynamicOffsets` array.
- `pDynamicOffsets` is a pointer to an array of `uint32_t` values specifying dynamic offsets.

`vkCmdBindDescriptorSets` causes the sets numbered [`firstSet.. firstSet+descriptorSetCount-1`] to use the bindings stored in `pDescriptorSets[0..descriptorSetCount-1]` for subsequent rendering commands (either compute or graphics, according to the `pipelineBindPoint`). Any bindings that were previously applied via these sets are no longer valid.

Once bound, a descriptor set affects rendering of subsequent graphics or compute commands in the command buffer until a different set is bound to the same set number, or else until the set is disturbed as described in [Pipeline Layout Compatibility](#).

A compatible descriptor set **must** be bound for all set numbers that any shaders in a pipeline access, at the time that a draw or dispatch command is recorded to execute using that pipeline. However, if none of the shaders in a pipeline statically use any bindings with a particular set number, then no descriptor set need be bound for that set number, even if the pipeline layout includes a non-trivial descriptor set layout for that set number.

If any of the sets being bound include dynamic uniform or storage buffers, then `pDynamicOffsets` includes one element for each array element in each dynamic descriptor type binding in each set. Values are taken from `pDynamicOffsets` in an order such that all entries for set N come before set N+1; within a set, entries are ordered by the binding numbers in the descriptor set layouts; and within a binding array, elements are in order. `dynamicOffsetCount` **must** equal the total number of dynamic descriptors in the sets being bound.

The effective offset used for dynamic uniform and storage buffer bindings is the sum of the relative offset taken from `pDynamicOffsets`, and the base address of the buffer plus base offset in the descriptor set. The range of the dynamic uniform and storage buffer bindings is the buffer range as specified in the descriptor set.

Each of the `pDescriptorSets` **must** be compatible with the pipeline layout specified by `layout`. The layout used to program the bindings **must** also be compatible with the pipeline used in subsequent graphics or compute commands, as defined in the [Pipeline Layout Compatibility](#) section.

The descriptor set contents bound by a call to `vkCmdBindDescriptorSets` **may** be consumed at the following times:

- For descriptor bindings created with the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT` bit set, the contents **may** be consumed when the command buffer is submitted to a queue, or during shader execution of the resulting draws and dispatches, or any time in between. Otherwise,
- during host execution of the command, or during shader execution of the resulting draws and dispatches, or any time in between.

Thus, the contents of a descriptor set binding **must** not be altered (overwritten by an update command, or freed) between the first point in time that it **may** be consumed, and when the command completes executing on the queue.

The contents of `pDynamicOffsets` are consumed immediately during execution of `vkCmdBindDescriptorSets`. Once all pending uses have completed, it is legal to update and reuse a descriptor set.

## Valid Usage

- Each element of `pDescriptorSets` **must** have been allocated with a `VkDescriptorSetLayout` that matches (is the same as, or identically defined as) the `VkDescriptorSetLayout` at set  $n$  in `layout`, where  $n$  is the sum of `firstSet` and the index into `pDescriptorSets`
- `dynamicOffsetCount` **must** be equal to the total number of dynamic descriptors in `pDescriptorSets`
- The sum of `firstSet` and `descriptorSetCount` **must** be less than or equal to `VkPipelineLayoutCreateInfo::setLayoutCount` provided when `layout` was created
- `pipelineBindPoint` **must** be supported by the `commandBuffer`'s parent `VkCommandPool`'s queue family
- Each element of `pDynamicOffsets` which corresponds to a descriptor binding with type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` **must** be a multiple of `VkPhysicalDeviceLimits ::minUniformBufferOffsetAlignment`
- Each element of `pDynamicOffsets` which corresponds to a descriptor binding with type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` **must** be a multiple of `VkPhysicalDeviceLimits ::minStorageBufferOffsetAlignment`
- For each dynamic uniform or storage buffer binding in `pDescriptorSets`, the sum of the effective offset, as defined above, and the range of the binding **must** be less than or equal to the size of the buffer

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value
- `layout` **must** be a valid `VkPipelineLayout` handle
- `pDescriptorSets` **must** be a valid pointer to an array of `descriptorSetCount` valid `VkDescriptorSet` handles
- If `dynamicOffsetCount` is not `0`, `pDynamicOffsets` **must** be a valid pointer to an array of `dynamicOffsetCount uint32_t` values
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- `descriptorSetCount` **must** be greater than `0`
- Each of `commandBuffer`, `layout`, and the elements of `pDescriptorSets` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Graphics Compute	

### 13.2.8. Push Descriptor Updates

In addition to allocating descriptor sets and binding them to a command buffer, an application **can** record descriptor updates into the command buffer.

To push descriptor updates into a command buffer, call:

```
void vkCmdPushDescriptorSetKHR(  
    VkCommandBuffer  
    VkPipelineBindPoint  
    VkPipelineLayout  
    uint32_t  
    uint32_t  
    const VkWriteDescriptorSet*  
                                commandBuffer,  
                                pipelineBindPoint,  
                                layout,  
                                set,  
                                descriptorWriteCount,  
                                pDescriptorWrites);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.
- `pipelineBindPoint` is a `VkPipelineBindPoint` indicating whether the descriptors will be used by graphics pipelines or compute pipelines. There is a separate set of push descriptor bindings for each of graphics and compute, so binding one does not disturb the other.
- `layout` is a `VkPipelineLayout` object used to program the bindings.
- `set` is the set number of the descriptor set in the pipeline layout that will be updated.
- `descriptorWriteCount` is the number of elements in the `pDescriptorWrites` array.
- `pDescriptorWrites` is a pointer to an array of `VkWriteDescriptorSet` structures describing the descriptors to be updated.

*Push descriptors* are a small bank of descriptors whose storage is internally managed by the command buffer rather than being written into a descriptor set and later bound to a command buffer. Push descriptors allow for incremental updates of descriptors without managing the lifetime of descriptor sets.

When a command buffer begins recording, all push descriptors are undefined. Push descriptors **can** be updated incrementally and cause shaders to use the updated descriptors for subsequent rendering commands (either compute or graphics, according to the `pipelineBindPoint`) until the descriptor is overwritten, or else until the set is disturbed as described in [Pipeline Layout Compatibility](#). When the set is disturbed or push descriptors with a different descriptor set layout are set, all push descriptors are undefined.

Push descriptors that are [statically used](#) by a pipeline **must** not be undefined at the time that a draw or dispatch command is recorded to execute using that pipeline. This includes immutable sampler descriptors, which **must** be pushed before they are accessed by a pipeline (the immutable samplers are pushed, rather than the samplers in `pDescriptorWrites`). Push descriptors that are not statically used **can** remain undefined.

Push descriptors do not use dynamic offsets. Instead, the corresponding non-dynamic descriptor types **can** be used and the `offset` member of `VkDescriptorBufferInfo` **can** be changed each time the descriptor is written.

Each element of `pDescriptorWrites` is interpreted as in `VkWriteDescriptorSet`, except the `dstSet` member is ignored.

To push an immutable sampler, use a `VkWriteDescriptorSet` with `dstBinding` and `dstArrayElement` selecting the immutable sampler's binding. If the descriptor type is `VK_DESCRIPTOR_TYPE_SAMPLER`, the `pImageInfo` parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout. If the descriptor type is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, the `sampler` member of the `pImageInfo` parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout.

## Valid Usage

- `pipelineBindPoint` **must** be supported by the `commandBuffer`'s parent `VkCommandPool`'s queue family
- `set` **must** be less than `VkPipelineLayoutCreateInfo::setLayoutCount` provided when `layout` was created
- `set` **must** be the unique set number in the pipeline layout that uses a descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value
- `layout` **must** be a valid `VkPipelineLayout` handle
- `pDescriptorWrites` **must** be a valid pointer to an array of `descriptorWriteCount` valid `VkWriteDescriptorSet` structures
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- `descriptorWriteCount` **must** be greater than `0`
- Both of `commandBuffer`, and `layout` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Graphics Compute	

### 13.2.9. Push Descriptor Updates with Descriptor Update Templates

It is also possible to use a descriptor update template to specify the push descriptors to update. To do so, call:

```
void vkCmdPushDescriptorSetWithTemplateKHR(  
    VkCommandBuffer  
    VkDescriptorUpdateTemplate  
    VkPipelineLayout  
    uint32_t  
    const void*
```

```
        commandBuffer,  
        descriptorUpdateTemplate,  
        layout,  
        set,  
        pData);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.

- `descriptorUpdateTemplate` is a descriptor update template defining how to interpret the descriptor information in `pData`.
- `layout` is a `VkPipelineLayout` object used to program the bindings. It **must** be compatible with the layout used to create the `descriptorUpdateTemplate` handle.
- `set` is the set number of the descriptor set in the pipeline layout that will be updated. This **must** be the same number used to create the `descriptorUpdateTemplate` handle.
- `pData` is a pointer to memory containing descriptors for the templated update.

## Valid Usage

- The `pipelineBindPoint` specified during the creation of the descriptor update template **must** be supported by the `commandBuffer`'s parent `VkCommandPool`'s queue family
- `pData` **must** be a valid pointer to a memory containing one or more valid instances of `VkDescriptorImageInfo`, `VkDescriptorBufferInfo`, or `VkBufferView` in a layout defined by `descriptorUpdateTemplate` when it was created with `vkCreateDescriptorUpdateTemplateKHR`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `descriptorUpdateTemplate` **must** be a valid `VkDescriptorUpdateTemplate` handle
- `layout` **must** be a valid `VkPipelineLayout` handle
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- Each of `commandBuffer`, `descriptorUpdateTemplate`, and `layout` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Graphics Compute	

*API example*

```

struct AppDataStructure
{
    VkDescriptorImageInfo imageInfo;           // a single image info
    // ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] =
{
    // binding to a single image descriptor
    {
        0,                                // binding
        0,                                // dstArrayElement
        1,                                // descriptorCount
        VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, // descriptorType
        offsetof(AppDataStructure, imageInfo),   // offset
        0                                   // stride is not required if
descriptorCount is 1
    }
};

// create a descriptor update template for descriptor set updates
const VkDescriptorUpdateTemplateCreateInfo createInfo =
{
    VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO, // sType
    NULL,                                         // pNext
    0,                                            // flags
    1,                                            // 
descriptorUpdateEntryCount
    descriptorUpdateTemplateEntries,                // 
DescriptorUpdateEntries
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, // templateType
    0,                                            // descriptorSetLayout,
ignored by given templateType
    VK_PIPELINE_BIND_POINT_GRAPHICS,               // pipelineBindPoint
    myPipelineLayout,                            // pipelineLayout
    0,                                            // set
};

VkDescriptorUpdateTemplate myDescriptorUpdateTemplate;
myResult = vkCreateDescriptorUpdateTemplate(

```

```

    myDevice,
    &createInfo,
    NULL,
    &myDescriptorUpdateTemplate);
}

AppDataStructure appData;
// fill appData here or cache it in your engine
vkCmdPushDescriptorSetWithTemplateKHR(myCmdBuffer, myDescriptorUpdateTemplate,
myPipelineLayout, 0, &appData);

```

### 13.2.10. Push Constant Updates

As described above in section [Pipeline Layouts](#), the pipeline layout defines shader push constants which are updated via Vulkan commands rather than via writes to memory or copy commands.

*Note*

Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

The values of push constants are undefined at the start of a command buffer.

To update push constants, call:

```

void vkCmdPushConstants(
    VkCommandBuffer           commandBuffer,
    VkPipelineLayout          layout,
    VkShaderStageFlags        stageFlags,
    uint32_t                  offset,
    uint32_t                  size,
    const void*               pValues);

```

- `commandBuffer` is the command buffer in which the push constant update will be recorded.
- `layout` is the pipeline layout used to program the push constant updates.
- `stageFlags` is a bitmask of [VkShaderStageFlagBits](#) specifying the shader stages that will use the push constants in the updated range.
- `offset` is the start offset of the push constant range to update, in units of bytes.
- `size` is the size of the push constant range to update, in units of bytes.
- `pValues` is a pointer to an array of `size` bytes containing the new push constant values.

*Note*

As `stageFlags` needs to include all flags the relevant push constant ranges were created with, any flags that are not supported by the queue family that the [VkCommandPool](#) used to allocate `commandBuffer` was created on are ignored.

## Valid Usage

- For each byte in the range specified by `offset` and `size` and for each shader stage in `stageFlags`, there **must** be a push constant range in `layout` that includes that byte and that stage
- For each byte in the range specified by `offset` and `size` and for each push constant range that overlaps that byte, `stageFlags` **must** include all stages in that push constant range's `VkPushConstantRange::stageFlags`
- `offset` **must** be a multiple of 4
- `size` **must** be a multiple of 4
- `offset` **must** be less than `VkPhysicalDeviceLimits::maxPushConstantsSize`
- `size` **must** be less than or equal to `VkPhysicalDeviceLimits::maxPushConstantsSize` minus `offset`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `layout` **must** be a valid `VkPipelineLayout` handle
- `stageFlags` **must** be a valid combination of `VkShaderStageFlagBits` values
- `stageFlags` **must** not be 0
- `pValues` **must** be a valid pointer to an array of `size` bytes
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- `size` **must** be greater than 0
- Both of `commandBuffer`, and `layout` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Graphics Compute	

### 13.3. Physical Storage Buffer Access

To query a 64-bit buffer device address value through which buffer memory **can** be accessed in a shader, call:

```
VkDeviceAddress vkGetBufferDeviceAddressKHR(  
    VkDevice device,  
    const VkBufferDeviceAddressInfoKHR* pInfo);
```

or the equivalent command

```
VkDeviceAddress vkGetBufferDeviceAddressEXT(  
    VkDevice device,  
    const VkBufferDeviceAddressInfoKHR* pInfo);
```

- **device** is the logical device that the buffer was created on.
- **pInfo** is a pointer to a `VkBufferDeviceAddressInfoKHR` structure specifying the buffer to retrieve an address for.

The 64-bit return value is an address of the start of **pInfo::buffer**. The address range starting at this value and whose size is the size of the buffer **can** be used in a shader to access the memory bound to that buffer, using the `SPV_KHR_physical_storage_buffer` extension or the equivalent `SPV_EXT_physical_storage_buffer` extension and the `PhysicalStorageBuffer` storage class. For example, this value **can** be stored in a uniform buffer, and the shader **can** read the value from the uniform buffer and use it to do a dependent read/write to this buffer. A value of zero is reserved as a “null” pointer and **must** not be returned as a valid buffer device address. All loads, stores, and atomics in a shader through `PhysicalStorageBuffer` pointers **must** access addresses in the address range of some buffer.

If the buffer was created with a non-zero value of `VkBufferOpaqueCaptureAddressCreateInfoKHR::opaqueCaptureAddress` or `VkBufferDeviceAddressCreateInfoEXT::deviceAddress` the return value will be the same address that was returned at capture time.

## Valid Usage

- The `bufferDeviceAddress` or `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT ::bufferDeviceAddress` feature **must** be enabled
- If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` or `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT ::bufferDeviceAddressMultiDevice` feature **must** be enabled

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pInfo` **must** be a valid pointer to a valid `VkBufferDeviceAddressInfoKHR` structure

The `VkBufferDeviceAddressInfoKHR` structure is defined as:

```
typedef struct VkBufferDeviceAddressInfoKHR {  
    VkStructureType    sType;  
    const void*        pNext;  
    VkBuffer          buffer;  
} VkBufferDeviceAddressInfoKHR;
```

or the equivalent

```
typedef VkBufferDeviceAddressInfoKHR VkBufferDeviceAddressInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `buffer` specifies the buffer whose address is being queried.

## Valid Usage

- If `buffer` is non-sparse and was not created with the `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR` flag, then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `buffer` **must** have been created with `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_KHR`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_INFO_KHR`
- `pNext` **must** be `NULL`
- `buffer` **must** be a valid `VkBuffer` handle

To query a 64-bit buffer opaque capture address, call:

```
uint64_t vkGetBufferOpaqueCaptureAddressKHR(  
    VkDevice device,  
    const VkBufferDeviceAddressInfoKHR* pInfo);
```

- `device` is the logical device that the buffer was created on.
- `pInfo` is a pointer to an instance of the `VkBufferDeviceAddressInfoKHR` structure specifying the buffer to retrieve an address for.

The 64-bit return value is an opaque capture address of the start of `pInfo::buffer`.

If the buffer was created with a non-zero value of `VkBufferOpaqueCaptureAddressCreateInfoKHR` `::opaqueCaptureAddress` the return value **must** be the same address.

## Valid Usage

- The `bufferDeviceAddress` feature **must** be enabled
- If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature **must** be enabled

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pInfo` **must** be a valid pointer to a valid `VkBufferDeviceAddressInfoKHR` structure

# Chapter 14. Shader Interfaces

When a pipeline is created, the set of shaders specified in the corresponding `Vk*PipelineCreateInfo` structure are implicitly linked at a number of different interfaces.

- [Shader Input and Output Interface](#)
- [Vertex Input Interface](#)
- [Fragment Output Interface](#)
- [Fragment Input Attachment Interface](#)
- [Shader Resource Interface](#)

Interface definitions make use of the following SPIR-V decorations:

- [DescriptorSet](#) and [Binding](#)
- [Location](#), [Component](#), and [Index](#)
- [Flat](#), [NoPerspective](#), [Centroid](#), and [Sample](#)
- [Block](#) and [BufferBlock](#)
- [InputAttachmentIndex](#)
- [Offset](#), [ArrayStride](#), and [MatrixStride](#)
- [BuiltIn](#)
- [PassthroughNV](#)

This specification describes valid uses for Vulkan of these decorations. Any other use of one of these decorations is invalid.

## 14.1. Shader Input and Output Interfaces

When multiple stages are present in a pipeline, the outputs of one stage form an interface with the inputs of the next stage. When such an interface involves a shader, shader outputs are matched against the inputs of the next stage, and shader inputs are matched against the outputs of the previous stage.

There are two classes of variables that **can** be matched between shader stages, built-in variables and user-defined variables. Each class has a different set of matching criteria. Generally, when non-shader stages are between shader stages, the user-defined variables, and most built-in variables, form an interface between the shader stages.

The variables forming the input or output *interfaces* are listed as operands to the `OpEntryPoint` instruction and are declared with the [Input](#) or [Output](#) storage classes, respectively, in the SPIR-V module.

[Output](#) variables of a shader stage have undefined values until the shader writes to them or uses the [Initializer](#) operand when declaring the variable.

### 14.1.1. Built-in Interface Block

Shader [built-in](#) variables meeting the following requirements define the *built-in interface block*. They **must**

- be explicitly declared (there are no implicit built-ins),
- be identified with a [BuiltIn](#) decoration,
- form object types as described in the [Built-in Variables](#) section, and
- be declared in a block whose top-level members are the built-ins.

Built-ins only participate in interface matching if they are declared in such a block. They **must** not have any [Location](#) or [Component](#) decorations.

There **must** be no more than one built-in interface block per shader per interface.

### 14.1.2. User-defined Variable Interface

The remaining variables listed by [OpEntryPoint](#) with the [Input](#) or [Output](#) storage class form the *user-defined variable interface*. These **must** have SPIR-V numerical types or, recursively, composite types of such types. By default, the components of such types have a width of 32 or 64 bits. If an implementation supports [storageInputOutput16](#), components **can** also have a width of 16 bits. These variables **must** be identified with a [Location](#) decoration and **can** also be identified with a [Component](#) decoration.

### 14.1.3. Interface Matching

A user-defined output variable is considered to match an input variable in the subsequent stage if the two variables are declared with the same [Location](#) and [Component](#) decoration and match in type and decoration, except that [interpolation decorations](#) are not **required** to match. [XfbBuffer](#), [XfbStride](#), [Offset](#), and [Stream](#) are also not required to match for the purposes of interface matching. For the purposes of interface matching, variables declared without a [Component](#) decoration are considered to have a [Component](#) decoration of zero.

*Note*

Matching rules for *passthrough geometry shaders* are slightly different and are described in the [Passthrough Interface Matching](#) section.

Variables or block members declared as structures are considered to match in type if and only if the structure members match in type, decoration, number, and declaration order. Variables or block members declared as arrays are considered to match in type only if both declarations specify the same element type and size.

Tessellation control and mesh shader per-vertex output variables and blocks, and tessellation control, tessellation evaluation, and geometry shader per-vertex input variables and blocks are required to be declared as arrays, with each element representing input or output values for a single vertex of a multi-vertex primitive. For the purposes of interface matching, the outermost array dimension of such variables and blocks is ignored.

At an interface between two non-fragment shader stages, the built-in interface block **must** match exactly, as described above, except for per-view outputs as described in [Mesh Shader Per-View Outputs](#). At an interface involving the fragment shader inputs, the presence or absence of any built-in output does not affect the interface matching.

At an interface between two shader stages, the user-defined variable interface **must** match exactly, as described above.

Any input value to a shader stage is well-defined as long as the preceding stages writes to a matching output, as described above.

Additionally, scalar and vector inputs are well-defined if there is a corresponding output satisfying all of the following conditions:

- the input and output match exactly in decoration,
- the output is a vector with the same basic type and has at least as many components as the input, and
- the common component type of the input and output is 16-bit integer or floating-point, or 32-bit integer or floating-point (64-bit component types are excluded).

In this case, the components of the input will be taken from the first components of the output, and any extra components of the output will be ignored.

#### 14.1.4. Location Assignment

This section describes how many locations are consumed by a given type. As mentioned above, geometry shader inputs, tessellation control shader inputs and outputs, and tessellation evaluation inputs all have an additional level of arrayness relative to other shader inputs and outputs. This outer array level is removed from the type before considering how many locations the type consumes.

The **Location** value specifies an interface slot comprised of a 32-bit four-component vector conveyed between stages. The **Component** specifies **components** within these vector locations. Only types with widths of 16, 32 or 64 are supported in shader interfaces.

Inputs and outputs of the following types consume a single interface location:

- 16-bit scalar and vector types, and
- 32-bit scalar and vector types, and
- 64-bit scalar and 2-component vector types.

64-bit three- and four-component vectors consume two consecutive locations.

If a declared input or output is an array of size  $n$  and each element takes  $m$  locations, it will be assigned  $m \times n$  consecutive locations starting with the location specified.

If the declared input or output is an  $n \times m$  16-, 32- or 64-bit matrix, it will be assigned multiple locations starting with the location specified. The number of locations assigned for each matrix will be the same as for an  $n$ -element array of  $m$ -component vectors.

The layout of a structure type used as an [Input](#) or [Output](#) depends on whether it is also a [Block](#) (i.e. has a [Block](#) decoration).

If it is not a [Block](#), then the structure type **must** have a [Location](#) decoration. Its members are assigned consecutive locations in their declaration order, with the first member assigned to the location specified for the structure type. The members, and their nested types, **must** not themselves have [Location](#) decorations.

If the structure type is a [Block](#) but without a [Location](#), then each of its members **must** have a [Location](#) decoration. If it is a [Block](#) with a [Location](#) decoration, then its members are assigned consecutive locations in declaration order, starting from the first member which is initially assigned the location specified for the [Block](#). Any member with its own [Location](#) decoration is assigned that location. Each remaining member is assigned the location after the immediately preceding member in declaration order.

The locations consumed by block and structure members are determined by applying the rules above in a depth-first traversal of the instantiated members as though the structure or block member were declared as an input or output variable of the same type.

Any two inputs listed as operands on the same [OpEntryPoint](#) **must** not be assigned the same location, either explicitly or implicitly. Any two outputs listed as operands on the same [OpEntryPoint](#) **must** not be assigned the same location, either explicitly or implicitly.

The number of input and output locations available for a shader input or output interface are limited, and dependent on the shader stage as described in [Shader Input and Output Locations](#). All variables in both the [built-in interface block](#) and the [user-defined variable interface](#) count against these limits. Each effective [Location](#) **must** have a value less than the number of locations available for the given interface, as specified in the "Locations Available" column in [Shader Input and Output Locations](#).

*Table 18. Shader Input and Output Locations*

Shader Interface	Locations Available
vertex input	<code>maxVertexInputAttributes</code>
vertex output	<code>maxVertexOutputComponents / 4</code>
tessellation control input	<code>maxTessellationControlPerVertexInputComponents / 4</code>
tessellation control output	<code>maxTessellationControlPerVertexOutputComponents / 4</code>
tessellation evaluation input	<code>maxTessellationEvaluationInputComponents / 4</code>
tessellation evaluation output	<code>maxTessellationEvaluationOutputComponents / 4</code>
geometry input	<code>maxGeometryInputComponents / 4</code>
geometry output	<code>maxGeometryOutputComponents / 4</code>
fragment input	<code>maxFragmentInputComponents / 4</code>
fragment output	<code>maxFragmentOutputAttachments</code>

### 14.1.5. Component Assignment

The [Component](#) decoration allows the [Location](#) to be more finely specified for scalars and vectors, down to the individual components within a location that are consumed. The components within a location are 0, 1, 2, and 3. A variable or block member starting at component N will consume components N, N+1, N+2, ... up through its size. For 16-, and 32-bit types, it is invalid if this sequence of components gets larger than 3. A scalar 64-bit type will consume two of these components in sequence, and a two-component 64-bit vector type will consume all four components available within a location. A three- or four-component 64-bit vector type **must** not specify a [Component](#) decoration. A three-component 64-bit vector type will consume all four components of the first location and components 0 and 1 of the second location. This leaves components 2 and 3 available for other component-qualified declarations.

A scalar or two-component 64-bit data type **must** not specify a [Component](#) decoration of 1 or 3. A [Component](#) decoration **must** not be specified for any type that is not a scalar or vector.

## 14.2. Vertex Input Interface

When the vertex stage is present in a pipeline, the vertex shader input variables form an interface with the vertex input attributes. The vertex shader input variables are matched by the [Location](#) and [Component](#) decorations to the vertex input attributes specified in the [pVertexInputState](#) member of the [VkGraphicsPipelineCreateInfo](#) structure.

The vertex shader input variables listed by [OpEntryPoint](#) with the [Input](#) storage class form the *vertex input interface*. These variables **must** be identified with a [Location](#) decoration and **can** also be identified with a [Component](#) decoration.

For the purposes of interface matching: variables declared without a [Component](#) decoration are considered to have a [Component](#) decoration of zero. The number of available vertex input locations is given by the [maxVertexInputAttributes](#) member of the [VkPhysicalDeviceLimits](#) structure.

See [Attribute Location and Component Assignment](#) for details.

All vertex shader inputs declared as above **must** have a corresponding attribute and binding in the pipeline.

## 14.3. Fragment Output Interface

When the fragment stage is present in a pipeline, the fragment shader outputs form an interface with the output attachments of the current subpass. The fragment shader output variables are matched by the [Location](#) and [Component](#) decorations to the color attachments specified in the [pColorAttachments](#) array of the [VkSubpassDescription](#) structure describing the subpass that the fragment shader is executed in.

The fragment shader output variables listed by [OpEntryPoint](#) with the [Output](#) storage class form the *fragment output interface*. These variables **must** be identified with a [Location](#) decoration. They **can** also be identified with a [Component](#) decoration and/or an [Index](#) decoration. For the purposes of interface matching: variables declared without a [Component](#) decoration are considered to have a [Component](#) decoration of zero, and variables declared without an [Index](#) decoration are considered to

have an [Index](#) decoration of zero.

A fragment shader output variable identified with a [Location](#) decoration of  $i$  is directed to the color attachment indicated by `pColorAttachments[i]`, after passing through the blending unit as described in [Blending](#), if enabled. Locations are consumed as described in [Location Assignment](#). The number of available fragment output locations is given by the `maxFragmentOutputAttachments` member of the `VkPhysicalDeviceLimits` structure.

Components of the output variables are assigned as described in [Component Assignment](#). Output components identified as 0, 1, 2, and 3 will be directed to the R, G, B, and A inputs to the blending unit, respectively, or to the output attachment if blending is disabled. If two variables are placed within the same location, they **must** have the same underlying type (floating-point or integer). The input values to blending or color attachment writes are undefined for components which do not correspond to a fragment shader output.

Fragment outputs identified with an [Index](#) of zero are directed to the first input of the blending unit associated with the corresponding [Location](#). Outputs identified with an [Index](#) of one are directed to the second input of the corresponding blending unit.

No *component aliasing* of output variables is allowed, that is there **must** not be two output variables which have the same location, component, and index, either explicitly declared or implied.

Output values written by a fragment shader **must** be declared with either `OpTypeFloat` or `OpTypeInt`, and a `Width` of 32. If `storageInputOutput16` is supported, output values written by a fragment shader **can** be also declared with either `OpTypeFloat` or `OpTypeInt` and a `Width` of 16. Composites of these types are also permitted. If the color attachment has a signed or unsigned normalized fixed-point format, color values are assumed to be floating-point and are converted to fixed-point as described in [Conversion from Floating-Point to Normalized Fixed-Point](#); If the color attachment has an integer format, color values are assumed to be integers and converted to the bit-depth of the target. Any value that cannot be represented in the attachment's format is undefined. For any other attachment format no conversion is performed. If the type of the values written by the fragment shader do not match the format of the corresponding color attachment, the resulting values are undefined for those components.

## 14.4. Fragment Input Attachment Interface

When a fragment stage is present in a pipeline, the fragment shader subpass inputs form an interface with the input attachments of the current subpass. The fragment shader subpass input variables are matched by `InputAttachmentIndex` decorations to the input attachments specified in the `pInputAttachments` array of the `VkSubpassDescription` structure describing the subpass that the fragment shader is executed in.

The fragment shader subpass input variables with the `UniformConstant` storage class and a decoration of `InputAttachmentIndex` that are statically used by `OpEntryPoint` form the *fragment input attachment interface*. These variables **must** be declared with a type of `OpTypeImage`, a `Dim` operand of `SubpassData`, and a `Sampled` operand of 2.

A subpass input variable identified with an `InputAttachmentIndex` decoration of  $i$  reads from the input attachment indicated by `pInputAttachments[i]` member of `VkSubpassDescription`. If the subpass

input variable is declared as an array of size N, it consumes N consecutive input attachments, starting with the index specified. There **must** not be more than one input variable with the same `InputAttachmentIndex` whether explicitly declared or implied by an array declaration. The number of available input attachment indices is given by the `maxPerStageDescriptorInputAttachments` member of the `VkPhysicalDeviceLimits` structure.

Variables identified with the `InputAttachmentIndex` **must** only be used by a fragment stage. The basic data type (floating-point, integer, unsigned integer) of the subpass input **must** match the basic format of the corresponding input attachment, or the values of subpass loads from these variables are undefined.

See [Input Attachment](#) for more details.

## 14.5. Shader Resource Interface

When a shader stage accesses buffer or image resources, as described in the [Resource Descriptors](#) section, the shader resource variables **must** be matched with the [pipeline layout](#) that is provided at pipeline creation time.

The set of shader resources that form the *shader resource interface* for a stage are the variables statically used by `OpEntryPoint` with the storage class of `Uniform`, `UniformConstant`, or `PushConstant`. For the fragment shader, this includes the [fragment input attachment interface](#).

The shader resource interface consists of two sub-interfaces: the push constant interface and the descriptor set interface.

### 14.5.1. Push Constant Interface

The shader variables defined with a storage class of `PushConstant` that are statically used by the shader entry points for the pipeline define the *push constant interface*. They **must** be:

- typed as `OpTypeStruct`,
- identified with a `Block` decoration, and
- laid out explicitly using the `Offset`, `ArrayStride`, and `MatrixStride` decorations as specified in [Offset and Stride Assignment](#).

There **must** be no more than one push constant block statically used per shader entry point.

Each statically used member of a push constant block **must** be placed at an `Offset` such that the entire member is entirely contained within the `VkPushConstantRange` for each `OpEntryPoint` that uses it, and the `stageFlags` for that range **must** specify the appropriate `VkShaderStageFlagBits` for that stage. The `Offset` decoration for any member of a push constant block **must** not cause the space required for that member to extend outside the range [0, `maxPushConstantsSize`).

Any member of a push constant block that is declared as an array **must** only be accessed with *dynamically uniform* indices.

## 14.5.2. Descriptor Set Interface

The *descriptor set interface* is comprised of the shader variables with the storage class of `StorageBuffer`, `Uniform` or `UniformConstant` (including the variables in the [fragment input attachment interface](#)) that are statically used by the shader entry points for the pipeline.

These variables **must** have `DescriptorSet` and `Binding` decorations specified, which are assigned and matched with the `VkDescriptorSetLayout` objects in the pipeline layout as described in [DescriptorSet and Binding Assignment](#).

The `Image Format` of an `OpTypeImage` declaration **must** not be `Unknown`, for variables which are used for `OpImageRead`, `OpImageSparseRead`, or `OpImageWrite` operations, except under the following conditions:

- For `OpImageWrite`, if the `shaderStorageImageWriteWithoutFormat` feature is enabled and the shader module declares the `StorageImageWriteWithoutFormat` capability.
- For `OpImageRead` or `OpImageSparseRead`, if the `shaderStorageImageReadWithoutFormat` feature is enabled and the shader module declares the `StorageImageReadWithoutFormat` capability.
- For `OpImageRead`, if `Dim` is `SubpassData` (indicating a read from an input attachment).

The `Image Format` of an `OpTypeImage` declaration **must** not be `Unknown`, for variables which are used for `OpAtomic*` operations.

Variables identified with the `Uniform` storage class are used to access transparent buffer backed resources. Such variables **must** be:

- typed as `OpTypeStruct`, or an array of this type,
- identified with a `Block` or `BufferBlock` decoration, and
- laid out explicitly using the `Offset`, `ArrayStride`, and `MatrixStride` decorations as specified in [Offset and Stride Assignment](#).

Variables identified with the `StorageBuffer` storage class are used to access transparent buffer backed resources. Such variables **must** be:

- typed as `OpTypeStruct`, or an array of this type,
- identified with a `Block` decoration, and
- laid out explicitly using the `Offset`, `ArrayStride`, and `MatrixStride` decorations as specified in [Offset and Stride Assignment](#).

The `Offset` decoration for any member of a `Block`-decorated variable in the `Uniform` storage class **must** not cause the space required for that variable to extend outside the range  $[0, \text{maxUniformBufferRange}]$ . The `Offset` decoration for any member of a `Block`-decorated variable in the `StorageBuffer` storage class **must** not cause the space required for that variable to extend outside the range  $[0, \text{maxStorageBufferRange}]$ .

Variables identified with the `Uniform` storage class **can** also be used to access transparent descriptor set backed resources when the variable is assigned to a descriptor set layout binding with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT`. In this case the variable **must** be

typed as `OpTypeStruct` and **cannot** be aggregated into arrays of that type. Further, the `Offset` decoration for any member of such a variable **must** not cause the space required for that variable to extend outside the range [0,`maxInlineUniformBlockSize`).

Variables identified with a storage class of `UniformConstant` and a decoration of `InputAttachmentIndex` **must** be declared as described in [Fragment Input Attachment Interface](#).

SPIR-V variables decorated with a descriptor set and binding that identify a [combined image sampler descriptor](#) **can** have a type of `OpTypeImage`, `OpTypeSampler` (`Sampled=1`), or `OpTypeSampledImage`.

Arrays of any of these types **can** be indexed with *constant integral expressions*. The following features **must** be enabled and capabilities **must** be declared in order to index such arrays with dynamically uniform or non-uniform indices:

- Storage images (except storage texel buffers and input attachments):
  - Dynamically uniform: `shaderStorageImageArrayDynamicIndexing` and `StorageImageArrayDynamicIndexing`
  - Non-uniform: `shaderStorageImageArrayNonUniformIndexing` and `StorageImageArrayNonUniformIndexingEXT`
- Storage texel buffers:
  - Dynamically uniform: `shaderStorageTexelBufferArrayDynamicIndexing` and `StorageTexelBufferArrayDynamicIndexingEXT`
  - Non-uniform: `shaderStorageTexelBufferArrayNonUniformIndexing` and `StorageTexelBufferArrayNonUniformIndexingEXT`
- Input attachments:
  - Dynamically uniform: `shaderInputAttachmentArrayDynamicIndexing` and `InputAttachmentArrayDynamicIndexingEXT`
  - Non-uniform: `shaderInputAttachmentArrayNonUniformIndexing` and `InputAttachmentArrayNonUniformIndexingEXT`
- Sampled images (except uniform texel buffers):
  - Dynamically uniform: `shaderSampledImageArrayDynamicIndexing` and `SampledImageArrayDynamicIndexing`
  - Non-uniform: `shaderSampledImageArrayNonUniformIndexing` and `SampledImageArrayNonUniformIndexingEXT`
- Uniform texel buffers:
  - Dynamically uniform: `shaderUniformTexelBufferArrayDynamicIndexing` and `UniformTexelBufferArrayDynamicIndexingEXT`
  - Non-uniform: `shaderUniformTexelBufferArrayNonUniformIndexing` and `UniformTexelBufferArrayNonUniformIndexingEXT`
- Uniform buffers:
  - Dynamically uniform: `shaderUniformBufferArrayDynamicIndexing` and `UniformBufferArrayDynamicIndexing`
  - Non-uniform: `shaderUniformBufferArrayNonUniformIndexing` and `UniformBufferArrayNonUniformIndexingEXT`
- Storage buffers:

- Dynamically uniform: `shaderStorageBufferArrayDynamicIndexing` and `StorageBufferArrayDynamicIndexing`
- Non-uniform: `shaderStorageBufferArrayNonUniformIndexing` and `StorageBufferArrayNonUniformIndexingEXT`
- Acceleration structures:
  - No additional capabilities needed.

If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is not dynamically uniform, then the corresponding non-uniform indexing feature **must** be enabled and the capability **must** be declared. If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is not uniform, then the corresponding dynamic indexing or non-uniform feature **must** be enabled and the capability **must** be declared.

If the combined image sampler enables sampler Y'C<sub>B</sub>C<sub>R</sub> conversion or samples a [subsampled image](#), it **must** be indexed only by constant integral expressions when aggregated into arrays in shader code, irrespective of the `shaderSampledImageArrayDynamicIndexing` feature.

*Table 19. Shader Resource and Descriptor Type Correspondence*

Resource type	Descriptor Type
sampler	<code>VK_DESCRIPTOR_TYPE_SAMPLER</code> or <code>VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER</code>

inline uniform block	Uniform	OpTypeStruct	Block, Offset, (ArrayStride), (MatrixStride)

<sup>1</sup>

in addition to [DescriptorSet](#) and [Binding](#)

### 14.5.3. DescriptorSet and Binding Assignment

A variable decorated with a [DescriptorSet](#) decoration of s and a [Binding](#) decoration of b indicates that this variable is associated with the [VkDescriptorSetLayoutBinding](#) that has a [binding](#) equal to b in [pSetLayouts\[s\]](#) that was specified in [VkPipelineLayoutCreateInfo](#).

[DescriptorSet](#) decoration values **must** be between zero and [maxBoundDescriptorSets](#) minus one, inclusive. [Binding](#) decoration values **can** be any 32-bit unsigned integer value, as described in [Descriptor Set Layout](#). Each descriptor set has its own binding name space.

If the [Binding](#) decoration is used with an array, the entire array is assigned that binding value. The array **must** be a single-dimensional array and size of the array **must** be no larger than the number of descriptors in the binding. If the array is runtime-sized, then array elements greater than or equal to the size of that binding in the bound descriptor set **must** not be used. If the array is runtime-sized, the [runtimeDescriptorArray](#) feature **must** be enabled and the [RuntimeDescriptorArrayEXT](#) capability **must** be declared. The index of each element of the array is referred to as the *arrayElement*. For the purposes of interface matching and descriptor set [operations](#), if a resource variable is not an array, it is treated as if it has an *arrayElement* of zero.

There is a limit on the number of resources of each type that **can** be accessed by a pipeline stage as shown in [Shader Resource Limits](#). The “Resources Per Stage” column gives the limit on the number each type of resource that **can** be statically used for an entry point in any given stage in a pipeline. The “Resource Types” column lists which resource types are counted against the limit. Some resource types count against multiple limits.

The pipeline layout **may** include descriptor sets and bindings which are not referenced by any variables statically used by the entry points for the shader stages in the binding’s [stageFlags](#).

However, if a variable assigned to a given [DescriptorSet](#) and [Binding](#) is statically used by the entry point for a shader stage, the pipeline layout **must** contain a descriptor set layout binding in that descriptor set layout and for that binding number, and that binding's [stageFlags](#) **must** include the appropriate [VkShaderStageFlagBits](#) for that stage. The variable **must** be of a valid resource type determined by its SPIR-V type and storage class, as defined in [Shader Resource and Storage Class Correspondence](#). The descriptor set layout binding **must** be of a corresponding descriptor type, as defined in [Shader Resource and Descriptor Type Correspondence](#).

*Note*

There are no limits on the number of shader variables that can have overlapping set and binding values in a shader; but which resources are [statically used](#) has an impact. If any shader variable identifying a resource is [statically used](#) in a shader, then the underlying descriptor bound at the declared set and binding must [support the declared type in the shader](#) when the shader executes.

If multiple shader variables are declared with the same set and binding values, and with the same underlying descriptor type, they can all be statically used within the same shader. However, accesses are not automatically synchronized, and [Aliased](#) decorations should be used to avoid data hazards (see [section 2.18.2 Aliasing in the SPIR-V specification](#)).

If multiple shader variables with the same set and binding values are declared in a single shader, but with different declared types, where any of those are not supported by the relevant bound descriptor, that shader can only be executed if the variables with the unsupported type are not statically used.

A noteworthy example of using multiple statically-used shader variables sharing the same descriptor set and binding values is a descriptor of type [VK\\_DESCRIPTOR\\_TYPE\\_COMBINED\\_IMAGE\\_SAMPLER](#) that has multiple corresponding shader variables in the [UniformConstant](#) storage class, where some could be [OpTypeImage](#), some could be [OpTypeSampler](#) ([Sampled=1](#)), and some could be [OpTypeSampledImage](#).

*Table 21. Shader Resource Limits*

Resources per Stage	Resource Types
<code>maxPerStageDescriptorSamplers</code> or <code>maxPerStageDescriptorUpdateAfterBindSamplers</code>	sampler
<code>maxPerStageDescriptorSampledImages</code> or <code>maxPerStageDescriptorUpdateAfterBindSampledImages</code>	combined image sampler

	uniform texel buffer
	storage image
	storage texel buffer
	uniform buffer
	uniform buffer dynamic

Resources per Stage	Resource Types
<code>maxPerStageDescriptorStorageBuffers</code> or <code>maxPerStageDescriptorUpdateAfterBindStorageBuffers</code>	storage buffer
<code>maxPerStageDescriptorInputAttachments</code> or <code>maxPerStageDescriptorUpdateAfterBindInputAttachments</code>	storage buffer dynamic input attachment <sup>1</sup>
<code>maxPerStageDescriptorInlineUniformBlocks</code> or <code>maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks</code>	inline uniform block

1

Input attachments **can** only be used in the fragment shader stage

#### 14.5.4. Offset and Stride Assignment

All variables with a storage class of `Uniform`, `StorageBuffer`, or `PushConstant` **must** be explicitly laid out using the `Offset`, `ArrayStride`, and `MatrixStride` decorations.

*Note*

The numeric order of `Offset` decorations does not need to follow member declaration order.

#### Alignment Requirements

There are different alignment requirements depending on the specific resources and on the features enabled on the device.

The *scalar alignment* of the type of an `OpTypeStruct` member is defined recursively as follows:

- A scalar of size N has a scalar alignment of N.
- A vector or matrix type has a scalar alignment equal to that of its component type.
- An array type has a scalar alignment equal to that of its element type.
- A structure has a scalar alignment equal to the largest scalar alignment of any of its members.

The *base alignment* of the type of an `OpTypeStruct` member is defined recursively as follows:

- A scalar has a base alignment equal to its scalar alignment.
- A two-component vector has a base alignment equal to twice its scalar alignment.
- A three- or four-component vector has a base alignment equal to four times its scalar alignment.
- An array has a base alignment equal to the base alignment of its element type.
- A structure has a base alignment equal to the largest base alignment of any of its members.
- A row-major matrix of C columns has a base alignment equal to the base alignment of a vector of C matrix components.
- A column-major matrix has a base alignment equal to the base alignment of the matrix column type.

The *extended alignment* of the type of an **OpTypeStruct** member is similarly defined as follows:

- A scalar, vector or matrix type has an extended alignment equal to its base alignment.
- An array or structure type has an extended alignment equal to the largest extended alignment of any of its members, rounded up to a multiple of 16.

A member is defined to *improperly straddle* if either of the following are true:

- It is a vector with total size less than or equal to 16 bytes, and has **Offset** decorations placing its first byte at F and its last byte at L, where  $\text{floor}(F / 16) \neq \text{floor}(L / 16)$ .
- It is a vector with total size greater than 16 bytes and has its **Offset** decorations placing its first byte at a non-integer multiple of 16.

## Standard Buffer Layout

Every member of an **OpTypeStruct** with storage class of **Uniform**, **StorageBuffer**, or **PushConstant** **must** be aligned according to the first matching rule as follows:

1. If the **scalarBlockLayout** feature is enabled on the device then every member **must** be aligned according to its scalar alignment.
2. All vectors **must** be aligned according to their scalar alignment.
3. If the **uniformBufferStandardLayout** feature is not enabled on the device, then any member of an **OpTypeStruct** with a storage class of **Uniform** and a decoration of **Block** **must** be aligned according to its extended alignment.
4. Every other member **must** be aligned according to its base alignment.

### Note

Even if scalar alignment is supported, it is generally more performant to use the *base alignment*.

The memory layout **must** obey the following rules:

- The **Offset** decoration of any member **must** be a multiple of its alignment.
- Any **ArrayStride** or **MatrixStride** decoration **must** be a multiple of the alignment of the array or matrix as defined above.

Unless the **scalarBlockLayout** feature is enabled on the device:

- Vectors **must** not improperly straddle, as defined above.
- The **Offset** decoration of a member **must** not place it between the end of a structure or an array and the next multiple of the alignment of that structure or array.

### Note

The **std430** layout in GLSL satisfies these rules for types using the base alignment. The **std140** layout satisfies the rules for types using the extended alignment.

## 14.6. Built-In Variables

Built-in variables are accessed in shaders by declaring a variable decorated with a `BuiltIn` SPIR-V decoration. The meaning of each `BuiltIn` decoration is as follows. In the remainder of this section, the name of a built-in is used interchangeably with a term equivalent to a variable decorated with that particular built-in. Built-ins that represent integer values **can** be declared as either signed or unsigned 32-bit integers.

### `BaryCoordNV`

The `BaryCoordNV` decoration **can** be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using perspective interpolation.

The `BaryCoordNV` decoration **must** be used only within fragment shaders.

The variable decorated with `BaryCoordNV` **must** be declared using the `Input` storage class.

The variable decorated with `BaryCoordNV` **must** be declared as three-component vector of 32-bit floating-point values.

### `BaryCoordNoPerspAMD`

The `BaryCoordNoPerspAMD` decoration **can** be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at the fragment's center. The K coordinate of the barycentric coordinates **can** be derived given the identity  $I + J + K = 1.0$ .

### `BaryCoordNoPerspNV`

The `BaryCoordNoPerspNV` decoration **can** be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using linear interpolation.

The `BaryCoordNoPerspNV` decoration **must** be used only within fragment shaders.

The variable decorated with `BaryCoordNoPerspNV` **must** be declared using the `Input` storage class.

The variable decorated with `BaryCoordNoPerspNV` **must** be declared as three-component vector of 32-bit floating-point values.

### `BaryCoordNoPerspCentroidAMD`

The `BaryCoordNoPerspCentroidAMD` decoration **can** be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at the centroid. The K coordinate of the barycentric coordinates **can** be derived given the identity  $I + J + K = 1.0$ .

### `BaryCoordNoPerspSampleAMD`

The `BaryCoordNoPerspCentroidAMD` decoration **can** be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at each covered sample. The K coordinate of

the barycentric coordinates **can** be derived given the identity  $I + J + K = 1.0$ .

#### BaryCoordPullModelAMD

The **BaryCoordPullModelAMD** decoration **can** be used to decorate a fragment shader input variable. This variable will contain  $(1/W, 1/I, 1/J)$  evaluated at the fragment center and **can** be used to calculate gradients and then interpolate I, J, and W at any desired sample location.

#### BaryCoordSmoothAMD

The **BaryCoordSmoothAMD** decoration **can** be used to decorate a fragment shader input variable. This variable will contain the  $(I,J)$  pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at the fragment's center. The K coordinate of the barycentric coordinates **can** be derived given the identity  $I + J + K = 1.0$ .

#### BaryCoordSmoothCentroidAMD

The **BaryCoordSmoothCentroidAMD** decoration **can** be used to decorate a fragment shader input variable. This variable will contain the  $(I,J)$  pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at the centroid. The K coordinate of the barycentric coordinates **can** be derived given the identity  $I + J + K = 1.0$ .

#### BaryCoordSmoothSampleAMD

The **BaryCoordSmoothCentroidAMD** decoration **can** be used to decorate a fragment shader input variable. This variable will contain the  $(I,J)$  pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at each covered sample. The K coordinate of the barycentric coordinates **can** be derived given the identity  $I + J + K = 1.0$ .

#### BaseInstance

Decorating a variable with the **BaseInstance** built-in will make that variable contain the integer value corresponding to the first instance that was passed to the command that invoked the current vertex shader invocation. **BaseInstance** is the **firstInstance** parameter to a *direct drawing command* or the **firstInstance** member of a structure consumed by an *indirect drawing command*.

The **BaseInstance** decoration **must** be used only within vertex shaders.

The variable decorated with **BaseInstance** **must** be declared using the input storage class.

The variable decorated with **BaseInstance** **must** be declared as a scalar 32-bit integer.

#### BaseVertex

Decorating a variable with the **BaseVertex** built-in will make that variable contain the integer value corresponding to the first vertex or vertex offset that was passed to the command that invoked the current vertex shader invocation. For *non-indexed drawing commands*, this variable is the **firstVertex** parameter to a *direct drawing command* or the **firstVertex** member of the structure consumed by an *indirect drawing command*. For *indexed drawing commands*, this variable is the **vertexOffset** parameter to a *direct drawing command* or the **vertexOffset** member of the structure consumed by an *indirect drawing command*.

The **BaseVertex** decoration **must** be used only within vertex shaders.

The variable decorated with **BaseVertex** **must** be declared using the input storage class.

The variable decorated with `BaseVertex` **must** be declared as a scalar 32-bit integer.

### `ClipDistance`

Decorating a variable with the `ClipDistance` built-in decoration will make that variable contain the mechanism for controlling user clipping. `ClipDistance` is an array such that the  $i^{\text{th}}$  element of the array specifies the clip distance for plane  $i$ . A clip distance of 0 means the vertex is on the plane, a positive distance means the vertex is inside the clip half-space, and a negative distance means the point is outside the clip half-space.

The `ClipDistance` decoration **must** be used only within mesh, vertex, fragment, tessellation control, tessellation evaluation, and geometry shaders.

In mesh or vertex shaders, any variable decorated with `ClipDistance` **must** be declared using the `Output` storage class.

In fragment shaders, any variable decorated with `ClipDistance` **must** be declared using the `Input` storage class.

In tessellation control, tessellation evaluation, or geometry shaders, any variable decorated with `ClipDistance` **must** not be in a storage class other than `Input` or `Output`.

Any variable decorated with `ClipDistance` **must** be declared as an array of 32-bit floating-point values.

#### *Note*

The array variable decorated with `ClipDistance` is explicitly sized by the shader.

#### *Note*

In the last vertex processing stage, these values will be linearly interpolated across the primitive and the portion of the primitive with interpolated distances less than 0 will be considered outside the clip volume. If `ClipDistance` is then used by a fragment shader, `ClipDistance` contains these linearly interpolated values.

### `ClipDistancePerViewNV`

Decorating a variable with the `ClipDistancePerViewNV` built-in decoration will make that variable contain the per-view clip distances. The per-view clip distances have the same semantics as `ClipDistance`.

The `ClipDistancePerViewNV` **must** be used only within mesh shaders.

Any variable decorated with `ClipDistancePerViewNV` **must** be declared using the `Output` storage class, and **must** also be decorated with the `PerViewNV` decoration.

Any variable decorated with `ClipDistancePerViewNV` **must** be declared as a two-dimensional array of 32-bit floating-point values.

### `CullDistance`

Decorating a variable with the `CullDistance` built-in decoration will make that variable contain the mechanism for controlling user culling. If any member of this array is assigned a negative

value for all vertices belonging to a primitive, then the primitive is discarded before rasterization.

The `CullDistance` decoration **must** be used only within mesh, vertex, fragment, tessellation control, tessellation evaluation, and geometry shaders.

In mesh or vertex shaders, any variable decorated with `CullDistance` **must** be declared using the `Output` storage class.

In fragment shaders, any variable decorated with `CullDistance` **must** be declared using the `Input` storage class.

In tessellation control, tessellation evaluation, or geometry shaders, any variable decorated with `CullDistance` **must** not be declared in a storage class other than input or output.

Any variable decorated with `CullDistance` **must** be declared as an array of 32-bit floating-point values.

*Note*

In fragment shaders, the values of the `CullDistance` array are linearly interpolated across each primitive.

*Note*

If `CullDistance` decorates an input variable, that variable will contain the corresponding value from the `CullDistance` decorated output variable from the previous shader stage.

## `CullDistancePerViewNV`

Decorating a variable with the `CullDistancePerViewNV` built-in decoration will make that variable contain the per-view cull distances. The per-view clip distances have the same semantics as `CullDistance`.

The `CullDistancePerViewNV` **must** be used only within mesh shaders.

Any variable decorated with `CullDistancePerViewNV` **must** be declared using the `Output` storage class, and **must** also be decorated with the `PerViewNV` decoration.

Any variable decorated with `CullDistancePerViewNV` **must** be declared as a two-dimensional array of 32-bit floating-point values.

## `DeviceIndex`

The `DeviceIndex` decoration **can** be applied to a shader input which will be filled with the device index of the physical device that is executing the current shader invocation. This value will be in the range  $[0, \max(1, \text{physicalDeviceCount})]$ , where `physicalDeviceCount` is the `physicalDeviceCount` member of `VkDeviceGroupCreateInfo`.

The `DeviceIndex` decoration **can** be used in any shader.

The variable decorated with `DeviceIndex` **must** be declared using the `Input` storage class.

The variable decorated with **DeviceIndex** **must** be declared as a scalar 32-bit integer.

### DrawIndex

Decorating a variable with the **DrawIndex** built-in will make that variable contain the integer value corresponding to the zero-based index of the drawing command that invoked the current task, mesh, or vertex shader invocation. For *indirect drawing commands*, **DrawIndex** begins at zero and increments by one for each draw command executed. The number of draw commands is given by the **drawCount** parameter. For *direct drawing commands*, **DrawIndex** is always zero. **DrawIndex** is dynamically uniform.

The **DrawIndex** decoration **must** be used only within task, mesh or vertex shaders.

The variable decorated with **DrawIndex** **must** be declared using the **Input** storage class.

The variable decorated with **DrawIndex** **must** be declared as a scalar 32-bit integer.

When task or mesh shaders are used, only the first active stage will have proper access to the variable, other stages will have undefined values.

### FragCoord

Decorating a variable with the **FragCoord** built-in decoration will make that variable contain the framebuffer coordinate  $(x, y, z, \frac{1}{w})$  of the fragment being processed. The  $(x, y)$  coordinate  $(0, 0)$  is the upper left corner of the upper left pixel in the framebuffer.

When **Sample Shading** is enabled, the  $x$  and  $y$  components of **FragCoord** reflect the location of one of the samples corresponding to the shader invocation.

Otherwise, the  $x$  and  $y$  components of **FragCoord** reflect the location of the center of the fragment.

The  $z$  component of **FragCoord** is the interpolated depth value of the primitive.

The  $w$  component is the interpolated  $\frac{1}{w}$ .

The **FragCoord** decoration **must** be used only within fragment shaders.

The variable decorated with **FragCoord** **must** be declared using the **Input** storage class.

The **Centroid** interpolation decoration is ignored, but allowed, on **FragCoord**.

The variable decorated with **FragCoord** **must** be declared as a four-component vector of 32-bit floating-point values.

### FragDepth

To have a shader supply a fragment-depth value, the shader **must** declare the **DepthReplacing** execution mode. Such a shader's fragment-depth value will come from the variable decorated with the **FragDepth** built-in decoration.

This value will be used for any subsequent depth testing performed by the implementation or writes to the depth attachment.

The **FragDepth** decoration **must** be used only within fragment shaders.

The variable decorated with `FragDepth` **must** be declared using the `Output` storage class.

The variable decorated with `FragDepth` **must** be declared as a scalar 32-bit floating-point value.

### `FragInvocationCountEXT`

Decorating a variable with the `FragInvocationCountEXT` built-in decoration will make that variable contain the maximum number of fragment shader invocations for the fragment, as determined by `minSampleShading`.

The `FragInvocationCountEXT` decoration **must** be used only within fragment shaders and the `FragmentDensityEXT` capability **must** be declared.

If `Sample Shading` is not enabled, `FragInvocationCountEXT` will be filled with a value of 1.

The variable decorated with `FragInvocationCountEXT` **must** be declared using the `Input` storage class.

The variable decorated with `FragInvocationCountEXT` **must** be declared as a scalar 32-bit integer.

### `FragSizeEXT`

Decorating a variable with the `FragSizeEXT` built-in decoration will make that variable contain the dimensions in pixels of the `area` that the fragment covers for that invocation.

The `FragSizeEXT` decoration **must** be used only within fragment shaders and the `FragmentDensityEXT` capability **must** be declared.

If fragment density map is not enabled, `FragSizeEXT` will be filled with a value of (1,1).

The variable decorated with `FragSizeEXT` **must** be declared using the `Input` storage class.

The variable decorated with `FragSizeEXT` **must** be declared as a two-component vector of 32-bit integers.

### `FragStencilRefEXT`

Decorating a variable with the `FragStencilRefEXT` built-in decoration will make that variable contain the new stencil reference value for all samples covered by the fragment. This value will be used as the stencil reference value used in stencil testing.

To write to `FragStencilRefEXT`, a shader **must** declare the `StencilRefReplacingEXT` execution mode. If a shader declares the `StencilRefReplacingEXT` execution mode and there is an execution path through the shader that does not set `FragStencilRefEXT`, then the fragment's stencil reference value is undefined for executions of the shader that take that path.

The `FragStencilRefEXT` decoration **must** be used only within fragment shaders.

The variable decorated with `FragStencilRefEXT` **must** be declared using the `Output` storage class.

The variable decorated with `FragStencilRefEXT` **must** be declared as a scalar integer value. Only the least significant `s` bits of the integer value of the variable decorated with `FragStencilRefEXT` are considered for stencil testing, where `s` is the number of bits in the stencil framebuffer attachment, and higher order bits are discarded.

## FragmentSizeNV

Decorating a variable with the `FragmentSizeNV` built-in decoration will make that variable contain the width and height of the fragment.

The `FragmentSizeNV` decoration **must** be used only within fragment shaders.

The variable decorated with `FragmentSizeNV` **must** be declared using the `Input` storage class.

The variable decorated with `FragmentSizeNV` **must** be declared as a two-component vector of 32-bit integers.

## FrontFacing

Decorating a variable with the `FrontFacing` built-in decoration will make that variable contain whether the fragment is front or back facing. This variable is non-zero if the current fragment is considered to be part of a `front-facing` polygon primitive or of a non-polygon primitive and is zero if the fragment is considered to be part of a back-facing polygon primitive.

The `FrontFacing` decoration **must** be used only within fragment shaders.

The variable decorated with `FrontFacing` **must** be declared using the `Input` storage class.

The variable decorated with `FrontFacing` **must** be declared as a boolean.

## FullyCoveredEXT

Decorating a variable with the `FullyCoveredEXT` built-in decoration will make that variable indicate whether the `fragment area` is fully covered by the generating primitive. This variable is non-zero if conservative rasterization is enabled and the current fragment area is fully covered by the generating primitive, and is zero if the fragment is not covered or partially covered, or conservative rasterization is disabled.

The `FullyCoveredEXT` decoration **must** be used only within fragment shaders and the `FragmentFullyCoveredEXT` capability **must** be declared.

The variable decorated with `FullyCoveredEXT` **must** be declared using the `Input` storage class.

The variable decorated with `FullyCoveredEXT` **must** be declared as a boolean.

If the implementation supports `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativeRasterizationPostDepthCoverage` and the `PostDepthCoverage` execution mode is specified the `SampleMask` built-in input variable will reflect the coverage after the early per-fragment depth and stencil tests are applied. If `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativeRasterizationPostDepthCoverage` is not supported the `PostDepthCoverage` execution mode **must** not be specified.

## GlobalInvocationId

Decorating a variable with the `GlobalInvocationId` built-in decoration will make that variable contain the location of the current invocation within the global workgroup. Each component is equal to the index of the local workgroup multiplied by the size of the local workgroup plus `LocalInvocationId`.

The `GlobalInvocationId` decoration **must** be used only within task, mesh, or compute shaders.

The variable decorated with `GlobalInvocationId` **must** be declared using the `Input` storage class.

The variable decorated with `GlobalInvocationId` **must** be declared as a three-component vector of 32-bit integers.

### HelperInvocation

Decorating a variable with the `HelperInvocation` built-in decoration will make that variable contain whether the current invocation is a helper invocation. This variable is non-zero if the current fragment being shaded is a helper invocation and zero otherwise. A helper invocation is an invocation of the shader that is produced to satisfy internal requirements such as the generation of derivatives.

The `HelperInvocation` decoration **must** be used only within fragment shaders.

The variable decorated with `HelperInvocation` **must** be declared using the `Input` storage class.

The variable decorated with `HelperInvocation` **must** be declared as a boolean.

#### *Note*

It is very likely that a helper invocation will have a value of `SampleMask` fragment shader input value that is zero.

### HitKindNV

A variable decorated with the `HitKindNV` decoration will describe the intersection that triggered the execution of the current shader. The values are determined by the intersection shader.

The `HitKindNV` decoration **must** only be used in any-hit and closest hit shaders.

Any variable decorated with `HitKindNV` **must** be declared using the `Input` storage class.

Any variable decorated with `HitKindNV` **must** be declared as a scalar 32-bit integer.

### HitTnv

A variable decorated with the `HitTnv` decoration is equivalent to a variable decorated with the `RayTmaxNV` decoration.

The `HitTnv` decoration **must** only be used in any-hit and closest hit shaders.

Any variable decorated with `HitTnv` **must** be declared using the `Input` storage class.

Any variable decorated with `HitTnv` **must** be declared as a scalar 32-bit floating-point value.

### IncomingRayFlagsNV

A variable with the `IncomingRayFlagsNV` decoration will contain the ray flags passed in to the trace call that invoked this particular shader.

The `IncomingRayFlagsNV` decoration **must** only be used in the intersection, any-hit, closest hit, and miss shaders.

Any variable decorated with `IncomingRayFlagsNV` **must** be declared using the `Input` storage class.

Any variable decorated with `IncomingRayFlagsNV` **must** be declared as a scalar 32-bit integer.

#### `InstanceCustomIndexNV`

A variable decorated with the `InstanceCustomIndexNV` decoration will contain the application-defined value of the instance that intersects the current ray. Only the lower 24 bits are valid, the upper 8 bits will be ignored.

The `InstanceCustomIndexNV` decoration **must** only be used in the intersection, any-hit, and closest hit shaders.

Any variable decorated with `InstanceCustomIndexNV` **must** be declared using the `Input` storage class.

Any variable decorated with `InstanceCustomIndexNV` **must** be declared as a scalar 32-bit integer.

#### `InstanceId`

Decorating a variable in an intersection, any-hit, or closest hit shader with the `InstanceId` decoration will make that variable contain the index of the instance that intersects the current ray.

The `InstanceId` decoration **must** be used only within intersection, any-hit, or closest hit shaders.

The variable decorated with `InstanceId` **must** be declared using the `Input` storage class.

The variable decorated with `InstanceId` **must** be declared as a scalar 32-bit integer.

#### `InvocationId`

Decorating a variable with the `InvocationId` built-in decoration will make that variable contain the index of the current shader invocation in a geometry shader, or the index of the output patch vertex in a tessellation control shader.

In a geometry shader, the index of the current shader invocation ranges from zero to the number of `instances` declared in the shader minus one. If the instance count of the geometry shader is one or is not specified, then `InvocationId` will be zero.

The `InvocationId` decoration **must** be used only within tessellation control and geometry shaders.

The variable decorated with `InvocationId` **must** be declared using the `Input` storage class.

The variable decorated with `InvocationId` **must** be declared as a scalar 32-bit integer.

#### `InvocationsPerPixelNV`

Decorating a variable with the `InvocationsPerPixelNV` built-in decoration will make that variable contain the maximum number of fragment shader invocations per pixel, as derived from the effective shading rate for the fragment. If a primitive does not fully cover a pixel, the number of fragment shader invocations for that pixel **may** be less than the value of `InvocationsPerPixelNV`. If the shading rate indicates a fragment covering multiple pixels, then `InvocationsPerPixelNV` will be one.

The `InvocationsPerPixelNV` decoration **must** be used only within fragment shaders.

The variable decorated with `InvocationsPerPixelNV` **must** be declared using the `Input` storage class.

The variable decorated with `InvocationsPerPixelNV` **must** be declared as a scalar 32-bit integer.

### InstanceIndex

Decorating a variable in a vertex shader with the `InstanceIndex` built-in decoration will make that variable contain the index of the instance that is being processed by the current vertex shader invocation. `InstanceIndex` begins at the `firstInstance` parameter to `vkCmdDraw` or `vkCmdDrawIndexed` or at the `firstInstance` member of a structure consumed by `vkCmdDrawIndirect` or `vkCmdDrawIndexedIndirect`.

The `InstanceIndex` decoration **must** be used only within vertex shaders.

The variable decorated with `InstanceIndex` **must** be declared using the `Input` storage class.

The variable decorated with `InstanceIndex` **must** be declared as a scalar 32-bit integer.

### LaunchIDNV

A variable decorated with the `LaunchIDNV` decoration will specify the index of the work item being process. One work item is generated for each of the `width × height × depth` items dispatched by a `vkCmdTraceRaysNV` command. All shader invocations inherit the same value for variables decorated with `LaunchIDNV`.

The `LaunchIDNV` decoration **must** only be used within the ray generation, intersection, any-hit, closest hit, and miss shaders.

Any variable decorated with `LaunchIDNV` **must** be declared using the `Input` storage class.

Any variable decorated with `LaunchIDNV` **must** be declared as a three-component vector of 32-bit integer values.

### LaunchSizeNV

A variable decorated with the `LaunchSizeNV` decoration will contain the `width`, `height`, and `depth` dimensions passed to the `vkCmdTraceRaysNV` command that initiated this shader execution. The `width` is in the first component, the `height` is in the second component, and the `depth` is in the third component.

The `LaunchSizeNV` decoration **must** only be used within ray generation, intersection, any-hit, closest hit, and miss shaders.

Any variable decorated with `LaunchSizeNV` **must** be declared using the `Input` storage class.

Any variable decorated with `LaunchSizeNV` **must** be declared as a three-component vector of 32-bit integer values.

### Layer

Decorating a variable with the `Layer` built-in decoration will make that variable contain the select layer of a multi-layer framebuffer attachment.

In a mesh, vertex, tessellation evaluation, or geometry shader, any variable decorated with `Layer`

can be written with the framebuffer layer index to which the primitive produced by that shader will be directed.

The last active *vertex processing stage* (in pipeline order) controls the `Layer` that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the `Layer`.

If the last active vertex processing stage shader entry point's interface does not include a variable decorated with `Layer`, then the first layer is used. If a vertex processing stage shader entry point's interface includes a variable decorated with `Layer`, it **must** write the same value to `Layer` for all output vertices of a given primitive. If the `Layer` value is less than 0 or greater than or equal to the number of layers in the framebuffer, then primitives **may** still be rasterized, fragment shaders **may** be executed, and the framebuffer values for all layers are undefined.

The `Layer` decoration **must** be used only within mesh, vertex, tessellation evaluation, geometry, and fragment shaders.

In a mesh, vertex, tessellation evaluation, or geometry shader, any variable decorated with `Layer` **must** be declared using the `Output` storage class. If such a variable is also decorated with `ViewportRelativeNV`, then the `ViewportIndex` is added to the layer that is used for rendering and that is made available in the fragment shader. If the shader writes to a variable decorated `ViewportMaskNV`, then the layer selected has a different value for each viewport a primitive is rendered to.

In a fragment shader, a variable decorated with `Layer` contains the layer index of the primitive that the fragment invocation belongs to.

In a fragment shader, any variable decorated with `Layer` **must** be declared using the `Input` storage class.

Any variable decorated with `Layer` **must** be declared as a scalar 32-bit integer.

## `LayerPerViewNV`

Decorating a variable with the `LayerPerViewNV` built-in decoration will make that variable contain the per-view layer information. The per-view layer has the same semantics as `Layer`, for each view.

The `LayerPerViewNV` **must** only be used within mesh shaders.

Any variable decorated with `LayerPerViewNV` **must** be declared using the `Output` storage class, and **must** also be decorated with the `PerViewNV` decoration.

Any variable decorated with `LayerPerViewNV` **must** be declared as an array of scalar 32-bit integer values.

## `LocalInvocationId`

Decorating a variable with the `LocalInvocationId` built-in decoration will make that variable contain the location of the current task, mesh, or compute shader invocation within the local workgroup. Each component ranges from zero through to the size of the workgroup in that dimension minus one.

The `LocalInvocationId` decoration **must** be used only within task, mesh, or compute shaders.

The variable decorated with `LocalInvocationId` **must** be declared using the `Input` storage class.

The variable decorated with `LocalInvocationId` **must** be declared as a three-component vector of 32-bit integers.

*Note*

If the size of the workgroup in a particular dimension is one, then the `LocalInvocationId` in that dimension will be zero. If the workgroup is effectively two-dimensional, then `LocalInvocationId.z` will be zero. If the workgroup is effectively one-dimensional, then both `LocalInvocationId.y` and `LocalInvocationId.z` will be zero.

### `LocalInvocationIndex`

Decorating a variable with the `LocalInvocationIndex` built-in decoration will make that variable contain a one-dimensional representation of `LocalInvocationId`. This is computed as:

```
LocalInvocationIndex =  
    LocalInvocationId.z * WorkgroupSize.x * WorkgroupSize.y +  
    LocalInvocationId.y * WorkgroupSize.x +  
    LocalInvocationId.x;
```

The `LocalInvocationIndex` decoration **must** be used only within task, mesh, or compute shaders.

The variable decorated with `LocalInvocationIndex` **must** be declared using the `Input` storage class.

The variable decorated with `LocalInvocationIndex` **must** be declared as a scalar 32-bit integer.

### `MeshViewCountNV`

Decorating a variable with the `MeshViewCountNV` built-in decoration will make that variable contain the number of views processed by the current mesh or task shader invocations.

The `MeshViewCountNV` decoration **must** only be used in task and mesh shaders.

Any variable decorated with `MeshViewCountNV` **must** be declared using the `Input` storage class.

Any variable decorated with `MeshViewCountNV` **must** be declared as a scalar 32-bit integer.

### `MeshViewIndicesNV`

Decorating a variable with the `MeshViewIndicesNV` built-in decoration will make that variable contain the mesh view indices. The mesh view indices is an array of values where each element holds the view number of one of the views being processed by the current mesh or task shader invocations. The array elements with indices great than or equal to `MeshViewCountNV` are undefined. If the value of `MeshViewIndicesNV[i]` is `j`, then any outputs decorated with `PerViewNV` will take on the value of array element `i` when processing primitives for view index `j`.

The `MeshViewIndicesNV` decoration **must** only be used in task and mesh shaders.

Any variable decorated with `MeshViewIndicesNV` **must** be declared using the `Input` storage class.

Any variable decorated with `MeshViewIndicesNV` **must** be declared as an array of scalar 32-bit integers.

### `NumSubgroups`

Decorating a variable with the `NumSubgroups` built-in decoration will make that variable contain the number of subgroups in the local workgroup.

The `NumSubgroups` decoration **must** be used only within task, mesh, or compute shaders.

The variable decorated with `NumSubgroups` **must** be declared using the `Input` storage class.

The object decorated with `NumSubgroups` **must** be declared as a scalar 32-bit integer.

### `NumWorkgroups`

Decorating a variable with the `NumWorkgroups` built-in decoration will make that variable contain the number of local workgroups that are part of the dispatch that the invocation belongs to. Each component is equal to the values of the workgroup count parameters passed into the dispatch commands.

The `NumWorkgroups` decoration **must** be used only within compute shaders.

The variable decorated with `NumWorkgroups` **must** be declared using the `Input` storage class.

The variable decorated with `NumWorkgroups` **must** be declared as a three-component vector of 32-bit integers.

### `ObjectRayDirectionNV`

A variable decorated with the `ObjectRayDirectionNV` decoration will specify the direction of the ray being processed, in object space.

The `ObjectRayDirectionNV` decoration **must** only be used within intersection, any-hit, closest hit, and miss shaders.

Any variable decorated with `ObjectRayDirectionNV` **must** be declared using the `Input` storage class.

Any variable decorated with `ObjectRayDirectionNV` **must** be declared as a three-component vector of 32-bit floating-point values.

### `ObjectRayOriginNV`

A variable decorated with the `ObjectRayOriginNV` decoration will specify the origin of the ray being processed, in object space.

The `ObjectRayOriginNV` decoration **must** only be used within intersection, any-hit, closest hit, and miss shaders.

Any variable decorated with `ObjectRayOriginNV` **must** be declared using the `Input` storage class.

Any variable decorated with `ObjectRayOriginNV` **must** be declared as a three-component vector of 32-bit floating-point values.

## ObjectToWorldNV

A variable decorated with the `ObjectToWorldNV` decoration will contain the current object-to-world transformation matrix, which is determined by the instance of the current intersection.

The `ObjectToWorldNV` decoration **must** only be used within intersection, any-hit, and closest hit shaders.

Any variable decorated with `ObjectToWorldNV` **must** be declared using the `Input` storage class.

Any variable decorated with `ObjectToWorldNV` **must** be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values.

## PatchVertices

Decorating a variable with the `PatchVertices` built-in decoration will make that variable contain the number of vertices in the input patch being processed by the shader. A single tessellation control or tessellation evaluation shader **can** read patches of differing sizes, so the value of the `PatchVertices` variable **may** differ between patches.

The `PatchVertices` decoration **must** be used only within tessellation control and tessellation evaluation shaders.

The variable decorated with `PatchVertices` **must** be declared using the `Input` storage class.

The variable decorated with `PatchVertices` **must** be declared as a scalar 32-bit integer.

## PointCoord

Decorating a variable with the `PointCoord` built-in decoration will make that variable contain the coordinate of the current fragment within the point being rasterized, normalized to the size of the point with origin in the upper left corner of the point, as described in [Basic Point Rasterization](#). If the primitive the fragment shader invocation belongs to is not a point, then the variable decorated with `PointCoord` contains an undefined value.

The `PointCoord` decoration **must** be used only within fragment shaders.

The variable decorated with `PointCoord` **must** be declared using the `Input` storage class.

The variable decorated with `PointCoord` **must** be declared as two-component vector of 32-bit floating-point values.

### Note

Depending on how the point is rasterized, `PointCoord` **may** never reach (0,0) or (1,1).

## PointSize

Decorating a variable with the `PointSize` built-in decoration will make that variable contain the size of point primitives. The value written to the variable decorated with `PointSize` by the last vertex processing stage in the pipeline is used as the framebuffer-space size of points produced by rasterization.

The `PointSize` decoration **must** be used only within mesh, vertex, tessellation control,

tessellation evaluation, and geometry shaders.

In a mesh or vertex shader, any variable decorated with **PointSize** **must** be declared using the **Output** storage class.

In a tessellation control, tessellation evaluation, or geometry shader, any variable decorated with **PointSize** **must** be declared using either the **Input** or **Output** storage class.

Any variable decorated with **PointSize** **must** be declared as a scalar 32-bit floating-point value.

*Note*

When **PointSize** decorates a variable in the **Input** storage class, it contains the data written to the output variable decorated with **PointSize** from the previous shader stage.

## Position

Decorating a variable with the **Position** built-in decoration will make that variable contain the position of the current vertex. In the last vertex processing stage, the value of the variable decorated with **Position** is used in subsequent primitive assembly, clipping, and rasterization operations.

The **Position** decoration **must** be used only within mesh, vertex, tessellation control, tessellation evaluation, and geometry shaders.

In a mesh or vertex shader, any variable decorated with **Position** **must** be declared using the **Output** storage class.

In a tessellation control, tessellation evaluation, or geometry shader, any variable decorated with **Position** **must** not be declared in a storage class other than **Input** or **Output**.

Any variable decorated with **Position** **must** be declared as a four-component vector of 32-bit floating-point values.

*Note*

When **Position** decorates a variable in the **Input** storage class, it contains the data written to the output variable decorated with **Position** from the previous shader stage.

## PositionPerViewNV

Decorating a variable with the **PositionPerViewNV** built-in decoration will make that variable contain the position of the current vertex, for each view.

The **PositionPerViewNV** decoration **must** be used only within mesh, vertex, tessellation control, tessellation evaluation, and geometry shaders.

In a vertex shader, any variable decorated with **PositionPerViewNV** **must** be declared using the **Output** storage class.

In a tessellation control, tessellation evaluation, or geometry shader, any variable decorated with **PositionPerViewNV** **must** not be declared in a storage class other than input or output.

Any variable decorated with `PositionPerViewNV` **must** be declared as an array of four-component vector of 32-bit floating-point values with at least as many elements as the maximum view in the subpass's view mask plus one. The array **must** be indexed by a constant or specialization constant.

Elements of the array correspond to views in a multiview subpass, and those elements corresponding to views in the view mask of the subpass the shader is compiled against will be used as the position value for those views. For the final vertex processing stage in the pipeline, values written to an output variable decorated with `PositionPerViewNV` are used in subsequent primitive assembly, clipping, and rasterization operations, as with `Position`. `PositionPerViewNV` output in an earlier vertex processing stage is available as an input in the subsequent vertex processing stage.

If a shader is compiled against a subpass that has the `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX` bit set, then the position values for each view **must** not differ in any component other than the X component. If the values do differ, one will be chosen in an implementation-dependent manner.

### `PrimitiveCountNV`

Decorating a variable with the `PrimitiveCountNV` decoration will make that variable contain the primitive count. The primitive count specifies the number of primitives in the output mesh produced by the mesh shader that will be processed by subsequent pipeline stages.

The `PrimitiveCountNV` decoration **must** only be used in mesh shaders.

Any variable decorated with `PrimitiveCountNV` **must** be declared using the `Output` storage class.

Any variable decorated with `PrimitiveCountNV` **must** be declared as a scalar 32-bit integer.

### `PrimitiveId`

Decorating a variable with the `PrimitiveId` built-in decoration will make that variable contain the index of the current primitive.

The index of the first primitive generated by a drawing command is zero, and the index is incremented after every individual point, line, or triangle primitive is processed.

For triangles drawn as points or line segments (see [Polygon Mode](#)), the primitive index is incremented only once, even if multiple points or lines are eventually drawn.

Variables decorated with `PrimitiveId` are reset to zero between each instance drawn.

Restarting a primitive topology using primitive restart has no effect on the value of variables decorated with `PrimitiveId`.

In tessellation control and tessellation evaluation shaders, it will contain the index of the patch within the current set of rendering primitives that correspond to the shader invocation.

In a geometry shader, it will contain the number of primitives presented as input to the shader since the current set of rendering primitives was started.

In a fragment shader, it will contain the primitive index written by the geometry shader if a

geometry shader is present, or with the value that would have been presented as input to the geometry shader had it been present.

In an intersection, any-hit, or closest hit shader, it will contain the index within the geometry of the triangle or bounding box being processed.

If a geometry shader is present and the fragment shader reads from an input variable decorated with `PrimitiveId`, then the geometry shader **must** write to an output variable decorated with `PrimitiveId` in all execution paths.

If a mesh shader is present and the fragment shader reads from an input variable decorated with `PrimitiveId`, then the mesh shader **must** write to the output variables decorated with `PrimitiveId` in all execution paths.

The `PrimitiveId` decoration **must** be used only within mesh, intersection, any-hit, closest hit, fragment, tessellation control, tessellation evaluation, and geometry shaders.

In an intersection, any-hit, closest hit, tessellation control, or tessellation evaluation shader, any variable decorated with `PrimitiveId` **must** be declared using the `Input` storage class.

In a geometry shader, any variable decorated with `PrimitiveId` **must** be declared using either the `Input` or `Output` storage class.

In a mesh shader, any variable decorated with `PrimitiveId` **must** be declared using the `Output` storage class.

In a fragment shader, any variable decorated with `PrimitiveId` **must** be declared using the `Input` storage class, and either the `Geometry` or `Tessellation` capability **must** also be declared.

Any variable decorated with `PrimitiveId` **must** be declared as a scalar 32-bit integer.

*Note*

When the `PrimitiveId` decoration is applied to an output variable in the mesh shader or geometry shader, the resulting value is seen through the `PrimitiveId` decorated input variable in the fragment shader.

## `PrimitiveIndicesNV`

Decorating a variable with the `PrimitiveIndicesNV` decoration will make that variable contain the output array of vertex index values. Depending on the output primitive type declared using the execution mode, the indices are split into groups of one (`OutputPoints`), two (`OutputLinesNV`), or three (`OutputTriangles`) indices and each group generates a primitive.

All index values **must** be in the range [0, N-1], where N is the value specified by the `OutputVertices` execution mode.

The `PrimitiveIndicesNV` decoration **must** only be used in mesh shaders.

Any variable decorated with `PrimitiveIndicesNV` **must** be declared using the `Output` storage class.

Any variable decorated with `PrimitiveIndicesNV` **must** be declared as an array of scalar 32-bit integers. The array **must** be sized according to the primitive type and `OutputPrimitivesNV`

execution modes, where the size is:

- the value specified by `OutputPrimitivesNV` if the execution mode is `OutputPoints`,
- two times the value specified by `OutputPrimitivesNV` if the execution mode is `OutputLinesNV`, or
- three times the value specified by `OutputPrimitivesNV` if the execution mode is `OutputTrianglesNV`.

### `RayTmaxNV`

A variable decorated with the `RayTmaxNV` decoration will contain the parametric `tmax` values of the ray being processed. The values are independent of the space in which the ray and origin exist.

The `tmax` value changes throughout the lifetime of the ray query that produced the intersection. In the closest hit shader, the value reflects the closest distance to the intersected primitive. In the any-hit shader, it reflects the distance to the primitive currently being intersected. In the intersection shader, it reflects the distance to the closest primitive intersected so far. The value can change in the intersection shader after calling `OpReportIntersectionNV` if the corresponding any-hit shader does not ignore the intersection. In a miss shader, the value is identical to the parameter passed into `OpTraceNV`.

The `RayTmaxNV` decoration **must** only be used with the intersection, any-hit, closest hit, and miss shaders.

Any variable decorated with `RayTmaxNV` **must** be declared with the `Input` storage class.

Any variable decorated with `RayTmaxNV` **must** be declared as a scalar 32-bit floating-point value.

### `RayTminNV`

A variable decorated with the `RayTminNV` decoration will contain the parametric `tmin` values of the ray being processed. The values are independent of the space in which the ray and origin exist.

The `tmin` value remains constant for the duration of the ray query.

The `RayTminNV` decoration **must** only be used with the intersection, any-hit, closest hit, and miss shaders.

Any variable decorated with `RayTminNV` **must** be declared with the `Input` storage class.

Any variable decorated with `RayTminNV` **must** be declared as a scalar 32-bit floating-point value.

### `SampleId`

Decorating a variable with the `SampleId` built-in decoration will make that variable contain the zero-based index of the sample the invocation corresponds to. `SampleId` ranges from zero to the number of samples in the framebuffer minus one. If a fragment shader entry point's interface includes an input variable decorated with `SampleId`, `Sample Shading` is considered enabled with a `minSampleShading` value of 1.0.

The `SampleId` decoration **must** be used only within fragment shaders.

The variable decorated with `SampleId` **must** be declared using the `Input` storage class.

The variable decorated with **SampleId** must be declared as a scalar 32-bit integer.

### SampleMask

Decorating a variable with the **SampleMask** built-in decoration will make any variable contain the sample coverage mask for the current fragment shader invocation.

A variable in the **Input** storage class decorated with **SampleMask** will contain a bitmask of the set of samples covered by the primitive generating the fragment during rasterization. It has a sample bit set if and only if the sample is considered covered for this fragment shader invocation. **SampleMask[]** is an array of integers. Bits are mapped to samples in a manner where bit B of mask M (**SampleMask[M]**) corresponds to sample  $32 \times M + B$ .

When state specifies multiple fragment shader invocations for a given fragment, the sample mask for any single fragment shader invocation specifies the subset of the covered samples for the fragment that correspond to the invocation. In this case, the bit corresponding to each covered sample will be set in exactly one fragment shader invocation.

If the **PostDepthCoverage** execution mode is specified, the sample is considered covered if and only if the sample is covered by the primitive and the sample passes the [early per-fragment tests](#). Otherwise the sample is considered covered if the sample is covered by the primitive, regardless of the result of the fragment tests.

A variable in the **Output** storage class decorated with **SampleMask** is an array of integers forming a bit array in a manner similar an input variable decorated with **SampleMask**, but where each bit represents coverage as computed by the shader. Modifying the sample mask by writing zero to a bit of **SampleMask** causes the sample to be considered uncovered. If this variable is also decorated with **OverrideCoverageNV**, the fragment coverage is replaced with the sample mask bits set in the shader otherwise the fragment coverage is **ANDed** with the bits of the sample mask. If the fragment shader is being evaluated at any frequency other than per-fragment, bits of the sample mask not corresponding to the current fragment shader invocation are ignored. This array **must** be sized in the fragment shader either implicitly or explicitly, to be no larger than the implementation-dependent maximum sample-mask (as an array of 32-bit elements), determined by the maximum number of samples. If a fragment shader entry point's interface includes an output variable decorated with **SampleMask**, the sample mask will be undefined for any array elements of any fragment shader invocations that fail to assign a value. If a fragment shader entry point's interface does not include an output variable decorated with **SampleMask**, the sample mask has no effect on the processing of a fragment.

The **SampleMask** decoration **must** be used only within fragment shaders.

Any variable decorated with **SampleMask** **must** be declared using either the **Input** or **Output** storage class.

Any variable decorated with **SampleMask** **must** be declared as an array of 32-bit integers.

### SamplePosition

Decorating a variable with the **SamplePosition** built-in decoration will make that variable contain the sub-pixel position of the sample being shaded. The top left of the pixel is considered to be at coordinate (0,0) and the bottom right of the pixel is considered to be at coordinate (1,1).

If the render pass has a fragment density map attachment, the variable will instead contain the sub-fragment position of the sample being shaded. The top left of the fragment is considered to be at coordinate (0,0) and the bottom right of the fragment is considered to be at coordinate (1,1) for any fragment area.

If a fragment shader entry point's interface includes an input variable decorated with `SamplePosition`, [Sample Shading](#) is considered enabled with a `minSampleShading` value of 1.0.

The `SamplePosition` decoration **must** be used only within fragment shaders.

The variable decorated with `SamplePosition` **must** be declared using the `Input` storage class. If the current pipeline uses [custom sample locations](#) the value of any variable decorated with the `SamplePosition` built-in decoration is undefined.

The variable decorated with `SamplePosition` **must** be declared as a two-component vector of 32-bit floating-point values.

#### `SMCountNV`

Decorating a variable with the `SMCountNV` built-in decoration will make that variable contain the number of SMs on the device.

The variable decorated with `SMCountNV` **must** be declared using the `Input` storage class.

The variable decorated with `SMCountNV` **must** be declared as a scalar 32-bit integer value.

#### `SMIDNV`

Decorating a variable with the `SMIDNV` built-in decoration will make that variable contain the ID of the SM on which the current shader invocation is running. This variable is in the range [0, `SMCountNV`-1].

The variable decorated with `SMIDNV` **must** be declared using the `Input` storage class.

The variable decorated with `SMIDNV` **must** be declared as a scalar 32-bit integer value.

#### `SubgroupId`

Decorating a variable with the `SubgroupId` built-in decoration will make that variable contain the index of the subgroup within the local workgroup. This variable is in range [0, `NumSubgroups`-1].

The `SubgroupId` decoration **must** be used only within task, mesh or, compute shaders.

The variable decorated with `SubgroupId` **must** be declared using the `Input` storage class.

The variable decorated with `SubgroupId` **must** be declared as a scalar 32-bit integer.

#### `SubgroupEqMask`

Decorating a variable with the `SubgroupEqMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bit corresponding to the `SubgroupLocalInvocationId` is set in the variable decorated with `SubgroupEqMask`. All other bits are set to zero.

The variable decorated with `SubgroupEqMask` **must** be declared using the `Input` storage class.

The variable decorated with `SubgroupEqMask` **must** be declared as a four-component vector of 32-bit integer values.

`SubgroupEqMaskKHR` is an alias of `SubgroupEqMask`.

### `SubgroupGeMask`

Decorating a variable with the `SubgroupGeMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations greater than or equal to `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupGeMask`. All other bits are set to zero.

The variable decorated with `SubgroupGeMask` **must** be declared using the `Input` storage class.

The variable decorated with `SubgroupGeMask` **must** be declared as a four-component vector of 32-bit integer values.

`SubgroupGeMaskKHR` is an alias of `SubgroupGeMask`.

### `SubgroupGtMask`

Decorating a variable with the `SubgroupGtMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations greater than `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupGtMask`. All other bits are set to zero.

The variable decorated with `SubgroupGtMask` **must** be declared using the `Input` storage class.

The variable decorated with `SubgroupGtMask` **must** be declared as a four-component vector of 32-bit integer values.

`SubgroupGtMaskKHR` is an alias of `SubgroupGtMask`.

### `SubgroupLeMask`

Decorating a variable with the `SubgroupLeMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than or equal to `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLeMask`. All other bits are set to zero.

The variable decorated with `SubgroupLeMask` **must** be declared using the `Input` storage class.

The variable decorated with `SubgroupLeMask` **must** be declared as a four-component vector of 32-bit integer values.

`SubgroupLeMaskKHR` is an alias of `SubgroupLeMask`.

### `SubgroupLtMask`

Decorating a variable with the `SubgroupLtMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLtMask`. All other bits are set to zero.

The variable decorated with `SubgroupLtMask` **must** be declared using the `Input` storage class.

The variable decorated with `SubgroupLtMask` **must** be declared as a four-component vector of 32-bit integer values.

`SubgroupLtMaskKHR` is an alias of `SubgroupLtMask`.

### `SubgroupLocalInvocationId`

Decorating a variable with the `SubgroupLocalInvocationId` builtin decoration will make that variable contain the index of the invocation within the subgroup. This variable is in range  $[0, \text{SubgroupSize}-1]$ .

The variable decorated with `SubgroupLocalInvocationId` **must** be declared using the `Input` storage class.

The variable decorated with `SubgroupLocalInvocationId` **must** be declared as a scalar 32-bit integer.

#### *Note*

There is no direct relationship between `SubgroupLocalInvocationId` and `LocalInvocationId` or `LocalInvocationIndex`. If the pipeline was created with `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT`, applications can compute their own local invocation index to serve the same purpose:

`index = SubgroupLocalInvocationId + SubgroupId * SubgroupSize`

If full subgroups are not enabled, some subgroups may be dispatched with inactive invocations that don't correspond to a local workgroup invocation, making the value of `index` unreliable.

### `SubgroupSize`

Decorating a variable with the `SubgroupSize` builtin decoration will make that variable contain the implementation-dependent `number of invocations in a subgroup`. This value **must** be a power-of-two integer.

If the pipeline was created with the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flag set, the `SubgroupSize` decorated variable will contain the subgroup size for each subgroup that gets dispatched. This value **must** be between `minSubgroupSize` and `maxSubgroupSize` and **must** be uniform with subgroup scope. The value **may** vary across a single draw or dispatch call, and for fragment shaders **may** vary across a single primitive.

If the pipeline was created with a chained `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure, the `SubgroupSize` decorated variable will match `requiredSubgroupSize`.

If the pipeline was not created with the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flag set and no `VkPipelineShaderStageRequiredSubgroupSizeCreateInfoEXT` structure was chained, the variable decorated with `SubgroupSize` will match `subgroupSize`.

The maximum number of invocations that an implementation can support per subgroup is 128.

- + The variable decorated with **SubgroupSize** **must** be declared using the **Input** storage class.
- + The variable decorated with **SubgroupSize** **must** be declared as a scalar 32-bit integer.

### TaskCountNV

Decorating a variable with the **TaskCountNV** decoration will make that variable contain the task count. The task count specifies the number of subsequent mesh shader workgroups that get generated upon completion of the task shader.

The **TaskCountNV** decoration **must** only be used in task shaders.

Any variable decorated with **TaskCountNV** **must** be declared using the **Output** storage class.

Any variable decorated with **TaskCountNV** **must** be declared as a scalar 32-bit integer.

### TessCoord

Decorating a variable with the **TessCoord** built-in decoration will make that variable contain the three-dimensional (u,v,w) barycentric coordinate of the tessellated vertex within the patch. u, v, and w are in the range [0,1] and vary linearly across the primitive being subdivided. For the tessellation modes of **Quads** or **IsoLines**, the third component is always zero.

The **TessCoord** decoration **must** be used only within tessellation evaluation shaders.

The variable decorated with **TessCoord** **must** be declared using the **Input** storage class.

The variable decorated with **TessCoord** **must** be declared as three-component vector of 32-bit floating-point values.

### TessLevelOuter

Decorating a variable with the **TessLevelOuter** built-in decoration will make that variable contain the outer tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with **TessLevelOuter** **can** be written to, which controls the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and **can** be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with **TessLevelOuter** **can** read the values written by the tessellation control shader.

The **TessLevelOuter** decoration **must** be used only within tessellation control and tessellation evaluation shaders.

In a tessellation control shader, any variable decorated with **TessLevelOuter** **must** be declared using the **Output** storage class.

In a tessellation evaluation shader, any variable decorated with **TessLevelOuter** **must** be declared using the **Input** storage class.

Any variable decorated with **TessLevelOuter** **must** be declared as an array of size four, containing 32-bit floating-point values.

## TessLevelInner

Decorating a variable with the `TessLevelInner` built-in decoration will make that variable contain the inner tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with `TessLevelInner` **can** be written to, which controls the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and **can** be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with `TessLevelInner` **can** read the values written by the tessellation control shader.

The `TessLevelInner` decoration **must** be used only within tessellation control and tessellation evaluation shaders.

In a tessellation control shader, any variable decorated with `TessLevelInner` **must** be declared using the `Output` storage class.

In a tessellation evaluation shader, any variable decorated with `TessLevelInner` **must** be declared using the `Input` storage class.

Any variable decorated with `TessLevelInner` **must** be declared as an array of size two, containing 32-bit floating-point values.

## VertexIndex

Decorating a variable with the `VertexIndex` built-in decoration will make that variable contain the index of the vertex that is being processed by the current vertex shader invocation. For non-indexed draws, this variable begins at the `firstVertex` parameter to `vkCmdDraw` or the `firstVertex` member of a structure consumed by `vkCmdDrawIndirect` and increments by one for each vertex in the draw. For indexed draws, its value is the content of the index buffer for the vertex plus the `vertexOffset` parameter to `vkCmdDrawIndexed` or the `vertexOffset` member of the structure consumed by `vkCmdDrawIndexedIndirect`.

The `VertexIndex` decoration **must** be used only within vertex shaders.

The variable decorated with `VertexIndex` **must** be declared using the `Input` storage class.

The variable decorated with `VertexIndex` **must** be declared as a scalar 32-bit integer.

### Note

`VertexIndex` starts at the same starting value for each instance.

## ViewIndex

The `ViewIndex` decoration **can** be applied to a shader input which will be filled with the index of the view that is being processed by the current shader invocation.

If multiview is enabled in the render pass, this value will be one of the bits set in the view mask of the subpass the pipeline is compiled against. If multiview is not enabled in the render pass, this value will be zero.

The `ViewIndex` decoration **must** not be used within compute shaders.

The variable decorated with `ViewIndex` **must** be declared using the `Input` storage class.

The variable decorated with `ViewIndex` **must** be declared as a scalar 32-bit integer.

### `ViewportIndex`

Decorating a variable with the `ViewportIndex` built-in decoration will make that variable contain the index of the viewport.

In a mesh, vertex, tessellation evaluation, or geometry shader, the variable decorated with `ViewportIndex` can be written to with the viewport index to which the primitive produced by that shader will be directed.

The selected viewport index is used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle.

The last active *vertex processing stage* (in pipeline order) controls the `ViewportIndex` that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the `ViewportIndex`.

If the last active vertex processing stage shader entry point's interface does not include a variable decorated with `ViewportIndex`, then the first viewport is used. If a vertex processing stage shader entry point's interface includes a variable decorated with `ViewportIndex`, it **must** write the same value to `ViewportIndex` for all output vertices of a given primitive.

The `ViewportIndex` decoration **must** be used only within mesh, vertex, tessellation evaluation, geometry, and fragment shaders.

In a mesh, vertex, tessellation evaluation, or geometry shader, any variable decorated with `ViewportIndex` **must** be declared using the `Output` storage class.

In a fragment shader, the variable decorated with `ViewportIndex` contains the viewport index of the primitive that the fragment invocation belongs to.

In a fragment shader, any variable decorated with `ViewportIndex` **must** be declared using the `Input` storage class.

Any variable decorated with `ViewportIndex` **must** be declared as a scalar 32-bit integer.

### `ViewportMaskNV`

Decorating a variable with the `ViewportMaskNV` built-in decoration will make that variable contain the viewport mask.

In a mesh, vertex, tessellation evaluation, or geometry shader, the variable decorated with `ViewportMaskNV` can be written to with the mask of which viewports the primitive produced by that shader will directed.

The `ViewportMaskNV` variable **must** be an array that has  $(\text{VkPhysicalDeviceLimits}::\text{maxViewports} / 32)$  elements. When a shader writes to this variable, bit B of element M controls whether a primitive is emitted to viewport  $32 \times M + B$ . The viewports indicated by the mask are used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle that a primitive will be transformed by.

The last active *vertex processing stage* (in pipeline order) controls the `ViewportMaskNV` that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the `ViewportMaskNV`. When `ViewportMaskNV` is written by the final vertex processing stage, any variable decorated with `ViewportIndex` in the fragment shader will have the index of the viewport that was used in generating that fragment.

If a vertex processing stage shader entry point's interface includes a variable decorated with `ViewportMaskNV`, it **must** write the same value to `ViewportMaskNV` for all output vertices of a given primitive.

The `ViewportMaskNV` decoration **must** be used only within mesh, vertex, tessellation evaluation, and geometry shaders.

Any variable decorated with `ViewportMaskNV` **must** be declared using the `Output` storage class.

Any variable decorated with `ViewportMaskNV` **must** be declared as an array of 32-bit integers.

### `ViewportMaskPerViewNV`

Decorating a variable with the `ViewportMaskPerViewNV` built-in decoration will make that variable contain the mask of viewports primitives are broadcast to, for each view.

The `ViewportMaskPerViewNV` decoration **must** be used only within mesh, vertex, tessellation control, tessellation evaluation, and geometry shaders.

Any variable decorated with `ViewportMaskPerViewNV` **must** be declared using the `Output` storage class.

The value written to an element of `ViewportMaskPerViewNV` in the last vertex processing stage is a bitmask indicating which viewports the primitive will be directed to. The primitive will be broadcast to the viewport corresponding to each non-zero bit of the bitmask, and that viewport index is used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle, for each view. The same values **must** be written to all vertices in a given primitive, or else the set of viewports used for that primitive is undefined.

Any variable decorated with `ViewportMaskPerViewNV` **must** be declared as an array of scalar 32-bit integers with at least as many elements as the maximum view in the subpass's view mask plus one. The array **must** be indexed by a constant or specialization constant.

Elements of the array correspond to views in a multiview subpass, and those elements corresponding to views in the view mask of the subpass the shader is compiled against will be used as the viewport mask value for those views. `ViewportMaskPerViewNV` output in an earlier vertex processing stage is not available as an input in the subsequent vertex processing stage.

Although `ViewportMaskNV` is an array, `ViewportMaskPerViewNV` is not a two-dimensional array. Instead, `ViewportMaskPerViewNV` is limited to 32 viewports.

### `WarpsPerSMNV`

Decorating a variable with the `WarpsPerSMNV` built-in decoration will make that variable contain the maximum number of warps executing on a SM.

The variable decorated with `WarpsPerSMNV` **must** be declared using the `Input` storage class.

The variable decorated with `WarpPerSMNV` **must** be declared as a scalar 32-bit integer value.

#### `WarpIDNV`

Decorating a variable with the `WarpIDNV` built-in decoration will make that variable contain the ID of the warp on a SM on which the current shader invocation is running. This variable is in the range [0, `WarpPerSMNV`-1].

The variable decorated with `WarpIDNV` **must** be declared using the `Input` storage class.

The variable decorated with `WarpIDNV` **must** be declared as a scalar 32-bit integer value.

#### `WorkgroupId`

Decorating a variable with the `WorkgroupId` built-in decoration will make that variable contain the global workgroup that the current invocation is a member of. Each component ranges from a base value to a base + count value, based on the parameters passed into the dispatch commands.

The `WorkgroupId` decoration **must** be used only within task, mesh, or compute shaders.

The variable decorated with `WorkgroupId` **must** be declared using the `Input` storage class.

The variable decorated with `WorkgroupId` **must** be declared as a three-component vector of 32-bit integers.

#### `WorkgroupSize`

Decorating an object with the `WorkgroupSize` built-in decoration will make that object contain the dimensions of a local workgroup. If an object is decorated with the `WorkgroupSize` decoration, this **must** take precedence over any execution mode set for `LocalSize`.

The `WorkgroupSize` decoration **must** be used only within task, mesh, or compute shaders.

The object decorated with `WorkgroupSize` **must** be a specialization constant or a constant.

The object decorated with `WorkgroupSize` **must** be declared as a three-component vector of 32-bit integers.

#### `WorldRayDirectionNV`

A variable decorated with the `WorldRayDirectionNV` decoration will specify the direction of the ray being processed, in world space.

The `WorldRayDirectionNV` decoration **must** only be used within intersection, any-hit, closest hit, and miss shaders.

Any variable decorated with `WorldRayDirectionNV` **must** be declared using the `Input` storage class.

Any variable decorated with `WorldRayDirectionNV` **must** be declared as a three-component vector of 32-bit floating-point values.

#### `WorldRayOriginNV`

A variable decorated with the `WorldRayOriginNV` decoration will specify the origin of the ray being processed, in world space.

The `WorldRayOriginNV` decoration **must** only be used within intersection, any-hit, closest hit, and

miss shaders.

Any variable decorated with `WorldRayOriginNV` **must** be declared using the `Input` storage class.

Any variable decorated with `WorldRayOriginNV` **must** be declared as a three-component vector of 32-bit floating-point values.

#### `WorldToObjectNV`

A variable decorated with the `WorldToObjectNV` decoration will contain the current world-to-object transformation matrix, which is determined by the instance of the current intersection.

The `WorldToObjectNV` decoration **must** only be used within intersection, any-hit, and closest hit shaders.

Any variable decorated with `WorldToObjectNV` **must** be declared using the `Input` storage class.

Any variable decorated with `WorldToObjectNV` **must** be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values.

# Chapter 15. Image Operations

## 15.1. Image Operations Overview

Vulkan Image Operations are operations performed by those SPIR-V Image Instructions which take an `OpTypeImage` (representing a `VkImageView`) or `OpTypeSampledImage` (representing a (`VkImageView`, `VkSampler`) pair) and texel coordinates as operands, and return a value based on one or more neighboring texture elements (*texels*) in the image.

*Note*

Texel is a term which is a combination of the words texture and element. Early interactive computer graphics supported texture operations on textures, a small subset of the image operations on images described here. The discrete samples remain essentially equivalent, however, so we retain the historical term texel to refer to them.

Image Operations include the functionality of the following SPIR-V Image Instructions:

- `OpImageSample*` and `OpImageSparseSample*` read one or more neighboring texels of the image, and `filter` the texel values based on the state of the sampler.
  - Instructions with `ImplicitLod` in the name `determine` the LOD used in the sampling operation based on the coordinates used in neighboring fragments.
  - Instructions with `ExplicitLod` in the name `determine` the LOD used in the sampling operation based on additional coordinates.
  - Instructions with `Proj` in the name apply homogeneous `projection` to the coordinates.
- `OpImageFetch` and `OpImageSparseFetch` return a single texel of the image. No sampler is used.
- `OpImage*Gather` and `OpImageSparse*Gather` read neighboring texels and `return a single component` of each.
- `OpImageRead` (and `OpImageSparseRead`) and `OpImageWrite` read and write, respectively, a texel in the image. No sampler is used.
- `OpImageSampleFootprintNV` identifies and returns information about the set of texels in the image that would be accessed by an equivalent `OpImageSample*` instruction.
- Instructions with `Dref` in the name apply `depth comparison` on the texel values.
- Instructions with `Sparse` in the name additionally return a `sparse residency` code.

### 15.1.1. Texel Coordinate Systems

Images are addressed by *texel coordinates*. There are three *texel coordinate systems*:

- normalized texel coordinates [0.0, 1.0]
- unnormalized texel coordinates [0.0, width / height / depth)
- integer texel coordinates [0, width / height / depth)

SPIR-V `OpImageFetch`, `OpImageSparseFetch`, `OpImageRead`, `OpImageSparseRead`, and `OpImageWrite` instructions use integer texel coordinates. Other image instructions **can** use either normalized or unnormalized texel coordinates (selected by the `unnormalizedCoordinates` state of the sampler used in the instruction), but there are [limitations](#) on what operations, image state, and sampler state is supported. Normalized coordinates are logically [converted](#) to unnormalized as part of image operations, and [certain steps](#) are only performed on normalized coordinates. The array layer coordinate is always treated as unnormalized even when other coordinates are normalized.

Normalized texel coordinates are referred to as  $(s, t, r, q, a)$ , with the coordinates having the following meanings:

- s: Coordinate in the first dimension of an image.
- t: Coordinate in the second dimension of an image.
- r: Coordinate in the third dimension of an image.
  - $(s, t, r)$  are interpreted as a direction vector for Cube images.
- q: Fourth coordinate, for homogeneous (projective) coordinates.
- a: Coordinate for array layer.

The coordinates are extracted from the SPIR-V operand based on the dimensionality of the image variable and type of instruction. For `Proj` instructions, the components are in order  $(s [t] [r] q)$ , with t and r being conditionally present based on the `Dim` of the image. For non-`Proj` instructions, the coordinates are  $(s [t] [r] [a])$ , with t and r being conditionally present based on the `Dim` of the image and a being conditionally present based on the `Arrayed` property of the image. Projective image instructions are not supported on `Arrayed` images.

Unnormalized texel coordinates are referred to as  $(u, v, w, a)$ , with the coordinates having the following meanings:

- u: Coordinate in the first dimension of an image.
- v: Coordinate in the second dimension of an image.
- w: Coordinate in the third dimension of an image.
- a: Coordinate for array layer.

Only the u and v coordinates are directly extracted from the SPIR-V operand, because only 1D and 2D (non-`Arrayed`) dimensionalities support unnormalized coordinates. The components are in order  $(u [v])$ , with v being conditionally present when the dimensionality is 2D. When normalized coordinates are converted to unnormalized coordinates, all four coordinates are used.

Integer texel coordinates are referred to as  $(i, j, k, l, n)$ , with the coordinates having the following meanings:

- i: Coordinate in the first dimension of an image.
- j: Coordinate in the second dimension of an image.
- k: Coordinate in the third dimension of an image.
- l: Coordinate for array layer.

- n: Coordinate for the sample index.

They are extracted from the SPIR-V operand in order ( $i, [j], [k], [l]$ ), with j and k conditionally present based on the **Dim** of the image, and l conditionally present based on the **Arrayed** property of the image. n is conditionally present and is taken from the **Sample** image operand.

For all coordinate types, unused coordinates are assigned a value of zero.

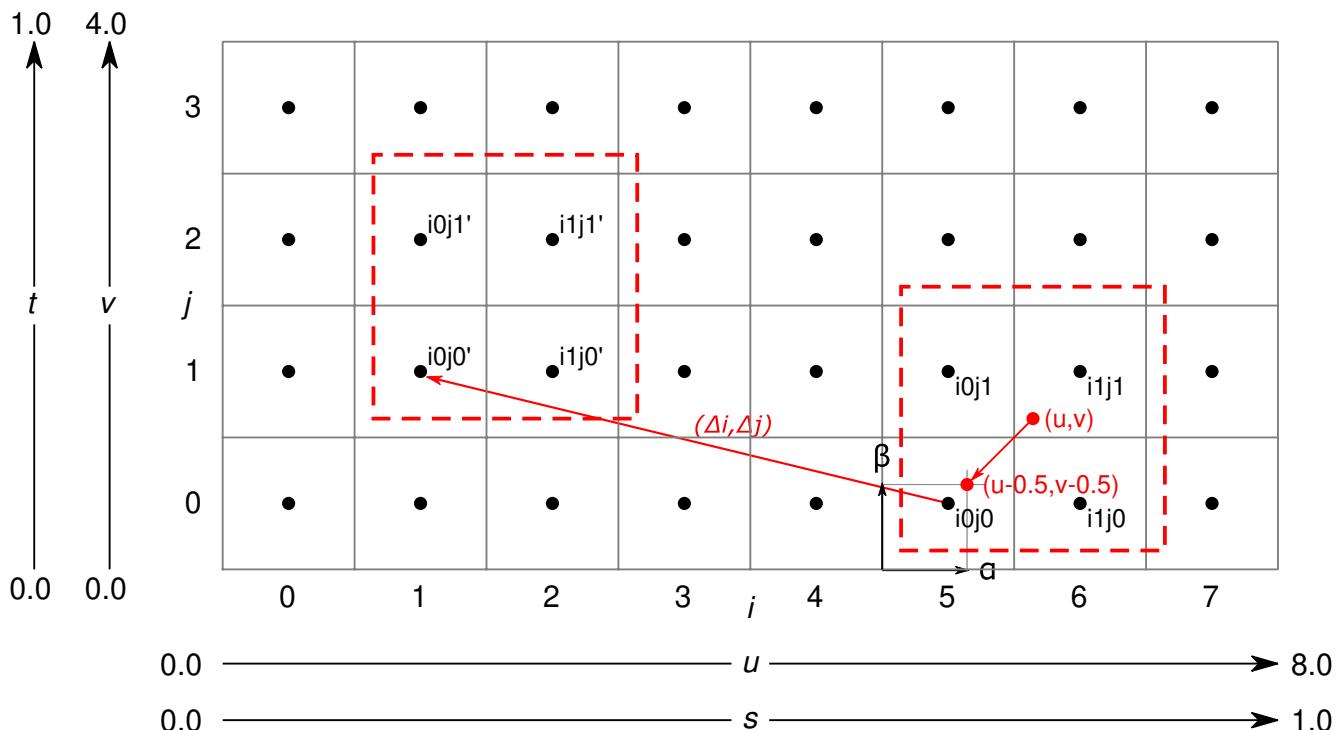

Figure 3. Texel Coordinate Systems, Linear Filtering

The Texel Coordinate Systems - For the example shown of an  $8 \times 4$  texel two dimensional image.

- Normalized texel coordinates:
  - The s coordinate goes from 0.0 to 1.0.
  - The t coordinate goes from 0.0 to 1.0.
- Unnormalized texel coordinates:
  - The u coordinate within the range 0.0 to 8.0 is within the image, otherwise it is outside the image.
  - The v coordinate within the range 0.0 to 4.0 is within the image, otherwise it is outside the image.
- Integer texel coordinates:
  - The i coordinate within the range 0 to 7 addresses texels within the image, otherwise it is outside the image.
  - The j coordinate within the range 0 to 3 addresses texels within the image, otherwise it is outside the image.
- Also shown for linear filtering:
  - Given the unnormalized coordinates  $(u, v)$ , the four texels selected are  $i_0j_0$ ,  $i_1j_0$ ,  $i_0j_1$ , and  $i_1j_1$ .

- The fractions  $\alpha$  and  $\beta$ .
- Given the offset  $\Delta_i$  and  $\Delta_j$ , the four texels selected by the offset are  $i_0j'_0$ ,  $i_1j'_0$ ,  $i_0j'_1$ , and  $i_1j'_1$ .

**Note**

For formats with reduced-resolution channels,  $\Delta_i$  and  $\Delta_j$  are relative to the resolution of the highest-resolution channel, and therefore may be divided by two relative to the unnormalized coordinate space of the lower-resolution channels.

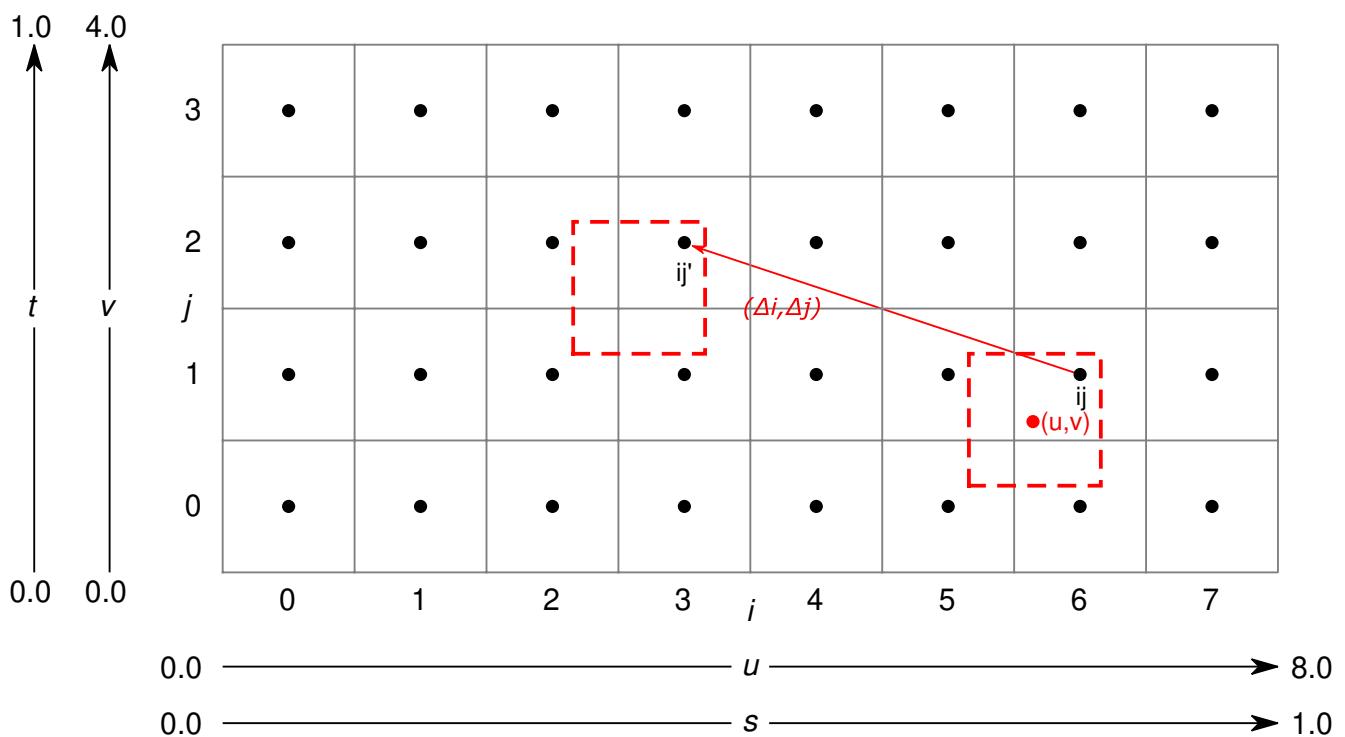

Figure 4. Texel Coordinate Systems, Nearest Filtering

The Texel Coordinate Systems - For the example shown of an  $8 \times 4$  texel two dimensional image.

- Texel coordinates as above. Also shown for nearest filtering:
  - Given the unnormalized coordinates  $(u, v)$ , the texel selected is  $ij$ .
  - Given the offset  $\Delta_i$  and  $\Delta_j$ , the texel selected by the offset is  $ij'$ .

For corner-sampled images, the texel samples are located at the grid intersections instead of the texel centers.

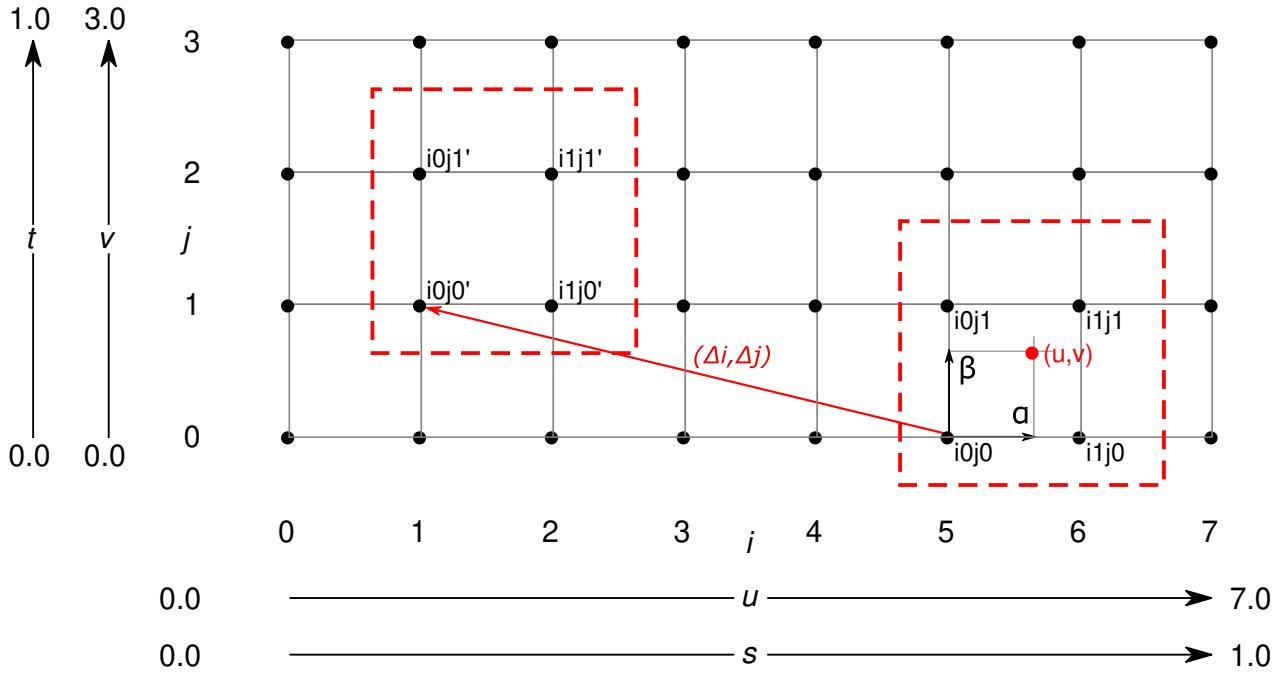

Figure 5. Texel Coordinate Systems, Corner Sampling

## 15.2. Conversion Formulas

### 15.2.1. RGB to Shared Exponent Conversion

An RGB color (red, green, blue) is transformed to a shared exponent color ( $\text{red}_{\text{shared}}$ ,  $\text{green}_{\text{shared}}$ ,  $\text{blue}_{\text{shared}}$ ,  $\text{exp}_{\text{shared}}$ ) as follows:

First, the components (red, green, blue) are clamped to ( $\text{red}_{\text{clamped}}$ ,  $\text{green}_{\text{clamped}}$ ,  $\text{blue}_{\text{clamped}}$ ) as:

$$\text{red}_{\text{clamped}} = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{red}))$$

$$\text{green}_{\text{clamped}} = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{green}))$$

$$\text{blue}_{\text{clamped}} = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{blue}))$$

where:

$N = 9$	number of mantissa bits per component
$B = 15$	exponent bias
$E_{\text{max}} = 31$	maximum possible biased exponent value
$\text{sharedexp}_{\text{max}} = \frac{(2^N - 1)}{2^N} \times 2^{(E_{\text{max}} - B)}$	

Note

**i** NaN, if supported, is handled as in IEEE 754-2008 `minNum()` and `maxNum()`. That is the result is a NaN is mapped to zero.

The largest clamped component,  $\text{max}_{\text{clamped}}$  is determined:

$$\max_{\text{clamped}} = \max(\text{red}_{\text{clamped}}, \text{green}_{\text{clamped}}, \text{blue}_{\text{clamped}})$$

A preliminary shared exponent  $\exp'$  is computed:

$$\exp' = \begin{cases} \lfloor \log_2(\max_{\text{clamped}}) \rfloor + (B + 1) & \text{for } \max_{\text{clamped}} > 2^{-(B + 1)} \\ 0 & \text{for } \max_{\text{clamped}} \leq 2^{-(B + 1)} \end{cases}$$

The shared exponent  $\exp_{\text{shared}}$  is computed:

$$\max_{\text{shared}} = \lfloor \frac{\max_{\text{clamped}}}{2^{(\exp' - B - N)}} + \frac{1}{2} \rfloor$$

$$\exp_{\text{shared}} = \begin{cases} \exp' & \text{for } 0 \leq \max_{\text{shared}} < 2^N \\ \exp' + 1 & \text{for } \max_{\text{shared}} = 2^N \end{cases}$$

Finally, three integer values in the range 0 to  $2^N$  are computed:

$$\begin{aligned} \text{red}_{\text{shared}} &= \lfloor \frac{\text{red}_{\text{clamped}}}{2^{(\exp_{\text{shared}} - B - N)}} + \frac{1}{2} \rfloor \\ \text{green}_{\text{shared}} &= \lfloor \frac{\text{green}_{\text{clamped}}}{2^{(\exp_{\text{shared}} - B - N)}} + \frac{1}{2} \rfloor \\ \text{blue}_{\text{shared}} &= \lfloor \frac{\text{blue}_{\text{clamped}}}{2^{(\exp_{\text{shared}} - B - N)}} + \frac{1}{2} \rfloor \end{aligned}$$

### 15.2.2. Shared Exponent to RGB

A shared exponent color ( $\text{red}_{\text{shared}}$ ,  $\text{green}_{\text{shared}}$ ,  $\text{blue}_{\text{shared}}$ ,  $\exp_{\text{shared}}$ ) is transformed to an RGB color (red, green, blue) as follows:

$$\text{red} = \text{red}_{\text{shared}} \times 2^{(\exp_{\text{shared}} - B - N)}$$

$$\text{green} = \text{green}_{\text{shared}} \times 2^{(\exp_{\text{shared}} - B - N)}$$

$$\text{blue} = \text{blue}_{\text{shared}} \times 2^{(\exp_{\text{shared}} - B - N)}$$

where:

$$N = 9 \text{ (number of mantissa bits per component)}$$

$$B = 15 \text{ (exponent bias)}$$

## 15.3. Texel Input Operations

*Texel input instructions* are SPIR-V image instructions that read from an image. *Texel input operations* are a set of steps that are performed on state, coordinates, and texel values while processing a texel input instruction, and which are common to some or all texel input instructions. They include the following steps, which are performed in the listed order:

- Validation operations
  - Instruction/Sampler/Image validation
  - Coordinate validation
  - Sparse validation
  - Layout validation
- Format conversion
- Texel replacement
- Depth comparison
- Conversion to RGBA
- Component swizzle
- Chroma reconstruction
- Y'C<sub>B</sub>C<sub>R</sub> conversion

For texel input instructions involving multiple texels (for sampling or gathering), these steps are applied for each texel that is used in the instruction. Depending on the type of image instruction, other steps are conditionally performed between these steps or involving multiple coordinate or texel values.

If [Chroma Reconstruction](#) is implicit, [Texel Filtering](#) instead takes place during chroma reconstruction, before sampler Y'C<sub>B</sub>C<sub>R</sub> conversion occurs.

### 15.3.1. Texel Input Validation Operations

*Texel input validation operations* inspect instruction/image/sampler state or coordinates, and in certain circumstances cause the texel value to be replaced or become undefined. There are a series of validations that the texel undergoes.

#### Instruction/Sampler/Image View Validation

There are a number of cases where a SPIR-V instruction **can** mismatch with the sampler, the image view, or both. There are a number of cases where the sampler **can** mismatch with the image view. In such cases the value of the texel returned is undefined.

These cases include:

- The sampler `borderColor` is an integer type and the image view `format` is not one of the `VkFormat` integer types or a stencil component of a depth/stencil format.
- The sampler `borderColor` is a float type and the image view `format` is not one of the `VkFormat` float types or a depth component of a depth/stencil format.
- The sampler `borderColor` is one of the opaque black colors (`VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK` or `VK_BORDER_COLOR_INT_OPAQUE_BLACK`) and the image view `VkComponentSwizzle` for any of the `VkComponentMapping` components is not `VK_COMPONENT_SWIZZLE_IDENTITY`.
- The `VkImageLayout` of any subresource in the image view does not match that specified in `VkDescriptorImageInfo::imageLayout` used to write the image descriptor.

- If the instruction is `OpImageRead` or `OpImageSparseRead` and the `shaderStorageImageReadWithoutFormat` feature is not enabled, or the instruction is `OpImageWrite` and the `shaderStorageImageWriteWithoutFormat` feature is not enabled, then the SPIR-V Image Format **must** be compatible with the image view's `format`.
- The sampler `unnormalizedCoordinates` is `VK_TRUE` and any of the limitations of unnormalized coordinates are violated.
- The sampler was created with `flags` containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` and the image was not created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.
- The sampler was not created with `flags` containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` and the image was created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.
- The sampler was created with `flags` containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` and is used with a function that is not `OpImageSampleImplicitLod` or `OpImageSampleExplicitLod`, or is used with operands `Offset` or `ConstOffsets`.
- The SPIR-V instruction is one of the `OpImage*Dref*` instructions and the sampler `compareEnable` is `VK_FALSE`
- The SPIR-V instruction is not one of the `OpImage*Dref*` instructions and the sampler `compareEnable` is `VK_TRUE`
- The SPIR-V instruction is one of the `OpImage*Dref*` instructions and the image view `format` is not one of the depth/stencil formats with a depth component, or the image view aspect is not `VK_IMAGE_ASPECT_DEPTH_BIT`.
- The SPIR-V instruction's image variable's properties are not compatible with the image view:
  - Rules for `viewType`:
    - `VK_IMAGE_VIEW_TYPE_1D` **must** have `Dim` = 1D, `Arrayed` = 0, `MS` = 0.
    - `VK_IMAGE_VIEW_TYPE_2D` **must** have `Dim` = 2D, `Arrayed` = 0.
    - `VK_IMAGE_VIEW_TYPE_3D` **must** have `Dim` = 3D, `Arrayed` = 0, `MS` = 0.
    - `VK_IMAGE_VIEW_TYPE_CUBE` **must** have `Dim` = Cube, `Arrayed` = 0, `MS` = 0.
    - `VK_IMAGE_VIEW_TYPE_1D_ARRAY` **must** have `Dim` = 1D, `Arrayed` = 1, `MS` = 0.
    - `VK_IMAGE_VIEW_TYPE_2D_ARRAY` **must** have `Dim` = 2D, `Arrayed` = 1.
    - `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` **must** have `Dim` = Cube, `Arrayed` = 1, `MS` = 0.
  - If the image was created with `VkImageCreateInfo::samples` equal to `VK_SAMPLE_COUNT_1_BIT`, the instruction **must** have `MS` = 0.
  - If the image was created with `VkImageCreateInfo::samples` not equal to `VK_SAMPLE_COUNT_1_BIT`, the instruction **must** have `MS` = 1.
- If the image was created with `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV`, the sampler addressing modes **must** only use a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.
- The SPIR-V instruction is `OpImageSampleFootprintNV` with `Dim` = 2D and `addressModeU` or `addressModeV` in the sampler is not `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.
- The SPIR-V instruction is `OpImageSampleFootprintNV` with `Dim` = 3D and `addressModeU`, `addressModeV`, or `addressModeW` in the sampler is not `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Only `OpImageSample*` and `OpImageSparseSample*` can be used with a sampler that enables sampler  $\text{Y}'\text{C}_B\text{C}_R$  conversion.

`OpImageFetch`, `OpImageSparseFetch`, `OpImage*Gather`, and `OpImageSparse*Gather` must not be used with a sampler that enables sampler  $\text{Y}'\text{C}_B\text{C}_R$  conversion.

The `ConstOffset` and `Offset` operands must not be used with a sampler that enables sampler  $\text{Y}'\text{C}_B\text{C}_R$  conversion.

## Integer Texel Coordinate Validation

Integer texel coordinates are validated against the size of the image level, and the number of layers and number of samples in the image. For SPIR-V instructions that use integer texel coordinates, this is performed directly on the integer coordinates. For instructions that use normalized or unnormalized texel coordinates, this is performed on the coordinates that result after conversion to integer texel coordinates.

If the integer texel coordinates do not satisfy all of the conditions

$$0 \leq i < w_s$$

$$0 \leq j < h_s$$

$$0 \leq k < d_s$$

$$0 \leq l < \text{layers}$$

$$0 \leq n < \text{samples}$$

where:

$w_s$  = width of the image level

$h_s$  = height of the image level

$d_s$  = depth of the image level

$\text{layers}$  = number of layers in the image

$\text{samples}$  = number of samples per texel in the image

then the texel fails integer texel coordinate validation.

There are four cases to consider:

### 1. Valid Texel Coordinates

- If the texel coordinates pass validation (that is, the coordinates lie within the image), then the texel value comes from the value in image memory.

## 2. Border Texel

- If the texel coordinates fail validation, and
- If the read is the result of an image sample instruction or image gather instruction, and
- If the image is not a cube image,

then the texel is a border texel and [texel replacement](#) is performed.

## 3. Invalid Texel

- If the texel coordinates fail validation, and
- If the read is the result of an image fetch instruction, image read instruction, or atomic instruction,

then the texel is an invalid texel and [texel replacement](#) is performed.

## 4. Cube Map Edge or Corner

Otherwise the texel coordinates lie beyond the edges or corners of the selected cube map face, and [Cube map edge handling](#) is performed.

### Cube Map Edge Handling

If the texel coordinates lie beyond the edges or corners of the selected cube map face, the following steps are performed. Note that this does not occur when using `VK_FILTER_NEAREST` filtering within a mip level, since `VK_FILTER_NEAREST` is treated as using `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- Cube Map Edge Texel

- If the texel lies beyond the selected cube map face in either only i or only j, then the coordinates (i,j) and the array layer l are transformed to select the adjacent texel from the appropriate neighboring face.

- Cube Map Corner Texel

- If the texel lies beyond the selected cube map face in both i and j, then there is no unique neighboring face from which to read that texel. The texel **should** be replaced by the average of the three values of the adjacent texels in each incident face. However, implementations **may** replace the cube map corner texel by other methods. The methods are subject to the constraint that for linear filtering if the three available texels have the same value, the resulting filtered texel **must** have that value, and for cubic filtering if the twelve available samples have the same value, the resulting filtered texel **must** have that value.

### Sparse Validation

If the texel reads from an unbound region of a sparse image, the texel is a *sparse unbound texel*, and processing continues with [texel replacement](#).

### Layout Validation

If all planes of a *disjoint multi-planar* image are not in the same [image layout](#), the image **must** not be sampled with [sampler Y'C<sub>B</sub>C<sub>R</sub> conversion](#) enabled.

### 15.3.2. Format Conversion

Texels undergo a format conversion from the [VkFormat](#) of the image view to a vector of either floating point or signed or unsigned integer components, with the number of components based on the number of components present in the format.

- Color formats have one, two, three, or four components, according to the format.
- Depth/stencil formats are one component. The depth or stencil component is selected by the [aspectMask](#) of the image view.

Each component is converted based on its type and size (as defined in the [Format Definition](#) section for each [VkFormat](#)), using the appropriate equations in [16-Bit Floating-Point Numbers](#), [Unsigned 11-Bit Floating-Point Numbers](#), [Unsigned 10-Bit Floating-Point Numbers](#), [Fixed-Point Data Conversion](#), and [Shared Exponent to RGB](#). Signed integer components smaller than 32 bits are sign-extended.

If the image view format is sRGB, the color components are first converted as if they are UNORM, and then sRGB to linear conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the [Khronos Data Format Specification](#). The A component, if present, is unchanged.

If the image view format is block-compressed, then the texel value is first decoded, then converted based on the type and number of components defined by the compressed format.

### 15.3.3. Texel Replacement

A texel is replaced if it is one (and only one) of:

- a border texel,
- an invalid texel, or
- a sparse unbound texel.

Border texels are replaced with a value based on the image format and the [borderColor](#) of the sampler. The border color is:

*Table 22. Border Color B*

Sampler <a href="#">borderColor</a>	Corresponding Border Color
<a href="#">VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK</a>	$[B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 0.0]$
<a href="#">VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK</a>	$[B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 1.0]$
<a href="#">VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE</a>	$[B_r, B_g, B_b, B_a] = [1.0, 1.0, 1.0, 1.0]$
<a href="#">VK_BORDER_COLOR_INT_TRANSPARENT_BLACK</a>	$[B_r, B_g, B_b, B_a] = [0, 0, 0, 0]$
<a href="#">VK_BORDER_COLOR_INT_OPAQUE_BLACK</a>	$[B_r, B_g, B_b, B_a] = [0, 0, 0, 1]$
<a href="#">VK_BORDER_COLOR_INT_OPAQUE_WHITE</a>	$[B_r, B_g, B_b, B_a] = [1, 1, 1, 1]$

*Note*

The names `VK_BORDER_COLOR_*_TRANSPARENT_BLACK`, `VK_BORDER_COLOR_*_OPAQUE_BLACK`, and `VK_BORDER_COLOR_*_OPAQUE_WHITE` are meant to describe which components are zeros and ones in the vocabulary of compositing, and are not meant to imply that the numerical value of `VK_BORDER_COLOR_INT_OPAQUE_WHITE` is a saturating value for integers.

This is substituted for the texel value by replacing the number of components in the image format

*Table 23. Border Texel Components After Replacement*

Texel Aspect or Format	Component Assignment
Depth aspect	$D = B_r$
Stencil aspect	$S = B_r$
One component color format	$\text{Color}_r = B_r$
Two component color format	$[\text{Color}_r, \text{Color}_g] = [B_r, B_g]$
Three component color format	$[\text{Color}_r, \text{Color}_g, \text{Color}_b] = [B_r, B_g, B_b]$
Four component color format	$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [B_r, B_g, B_b, B_a]$

The value returned by a read of an invalid texel is undefined, unless that read operation is from a buffer resource and the `robustBufferAccess` feature is enabled. In that case, an invalid texel is replaced as described by the `robustBufferAccess` feature.

If the `VkPhysicalDeviceSparseProperties::residencyNonResidentStrict` property is `VK_TRUE`, a sparse unbound texel is replaced with 0 or 0.0 values for integer and floating-point components of the image format, respectively.

If `residencyNonResidentStrict` is `VK_FALSE`, the value of the sparse unbound texel is undefined.

### 15.3.4. Depth Compare Operation

If the image view has a depth/stencil format, the depth component is selected by the `aspectMask`, and the operation is a `Dref` instruction, a depth comparison is performed. The value of the result  $D$  is 1.0 if the result of the compare operation is true, and 0.0 otherwise. The compare operation is selected by the `compareOp` member of the sampler.

$$D = \begin{cases} 1.0 & \begin{cases} D_{ref} \leq D & \text{for LEQUAL} \\ D_{ref} \geq D & \text{for GEQUAL} \\ D_{ref} < D & \text{for LESS} \\ D_{ref} > D & \text{for GREATER} \\ D_{ref} = D & \text{for EQUAL} \\ D_{ref} \neq D & \text{for NOTEQUAL} \\ \text{true} & \text{for ALWAYS} \\ \text{false} & \text{for NEVER} \end{cases} \\ 0.0 & \text{otherwise} \end{cases}$$

where, in the depth comparison:

$D_{ref}$  = shaderOp.D<sub>ref</sub> (from **optional** SPIR-V operand)

D (texel depth value)

### 15.3.5. Conversion to RGBA

The texel is expanded from one, two, or three components to four components based on the image base color:

Table 24. Texel Color After Conversion To RGBA

Texel Aspect or Format	RGBA Color
Depth aspect	[Color <sub>r</sub> , Color <sub>g</sub> , Color <sub>b</sub> , Color <sub>a</sub> ] = [D, 0, 0, one]
Stencil aspect	[Color <sub>r</sub> , Color <sub>g</sub> , Color <sub>b</sub> , Color <sub>a</sub> ] = [S, 0, 0, one]
One component color format	[Color <sub>r</sub> , Color <sub>g</sub> , Color <sub>b</sub> , Color <sub>a</sub> ] = [Color <sub>r</sub> , 0, 0, one]
Two component color format	[Color <sub>r</sub> , Color <sub>g</sub> , Color <sub>b</sub> , Color <sub>a</sub> ] = [Color <sub>r</sub> , Color <sub>g</sub> , 0, one]
Three component color format	[Color <sub>r</sub> , Color <sub>g</sub> , Color <sub>b</sub> , Color <sub>a</sub> ] = [Color <sub>r</sub> , Color <sub>g</sub> , Color <sub>b</sub> , one]
Four component color format	[Color <sub>r</sub> , Color <sub>g</sub> , Color <sub>b</sub> , Color <sub>a</sub> ] = [Color <sub>r</sub> , Color <sub>g</sub> , Color <sub>b</sub> , Color <sub>a</sub> ]

where one = 1.0f for floating-point formats and depth aspects, and one = 1 for integer formats and stencil aspects.

### 15.3.6. Component Swizzle

All texel input instructions apply a *swizzle* based on:

- the `VkComponentSwizzle` enums in the `components` member of the `VkImageViewCreateInfo` structure for the image being read if `sampler Y'CBCR conversion` is not enabled, and
- the `VkComponentSwizzle` enums in the `components` member of the `VkSamplerYcbcrConversionCreateInfo` structure for the `sampler Y'CBCR conversion` if `sampler Y'CBCR conversion` is enabled.

The swizzle **can** rearrange the components of the texel, or substitute zero or one for any components. It is defined as follows for each color component:

$$Color'_{component} = \begin{cases} Color_r & \text{for RED swizzle} \\ Color_g & \text{for GREEN swizzle} \\ Color_b & \text{for BLUE swizzle} \\ Color_a & \text{for ALPHA swizzle} \\ 0 & \text{for ZERO swizzle} \\ one & \text{for ONE swizzle} \\ identity & \text{for IDENTITY swizzle} \end{cases}$$

where:

$$one = \begin{cases} 1.0f & \text{for floating point components} \\ 1 & \text{for integer components} \end{cases}$$

$$identity = \begin{cases} Color_r & \text{for component} = r \\ Color_g & \text{for component} = g \\ Color_b & \text{for component} = b \\ Color_a & \text{for component} = a \end{cases}$$

If the border color is one of the `VK_BORDER_COLOR_*_OPAQUE_BLACK` enums and the `VkComponentSwizzle` is not `VK_COMPONENT_SWIZZLE_IDENTITY` for all components (or the equivalent identity mapping), the value of the texel after swizzle is undefined.

### 15.3.7. Sparse Residency

`OpImageSparse*` instructions return a structure which includes a *residency code* indicating whether any texels accessed by the instruction are sparse unbound texels. This code **can** be interpreted by the `OpImageSparseTexelsResident` instruction which converts the residency code to a boolean value.

### 15.3.8. Chroma Reconstruction

In some color models, the color representation is defined in terms of monochromatic light intensity (often called “luma”) and color differences relative to this intensity, often called “chroma”. It is common for color models other than RGB to represent the chroma channels at lower spatial resolution than the luma channel. This approach is used to take advantage of the eye’s lower spatial sensitivity to color compared with its sensitivity to brightness. Less commonly, the same approach is used with additive color, since the green channel dominates the eye’s sensitivity to light intensity and the spatial sensitivity to color introduced by red and blue is lower.

Lower-resolution channels are “downsampled” by resizing them to a lower spatial resolution than the channel representing luminance. The process of reconstructing a full color value for texture access involves accessing both chroma and luma values at the same location. To generate the color accurately, the values of the lower-resolution channels at the location of the luma samples must be reconstructed from the lower-resolution sample locations, an operation known here as “chroma reconstruction” irrespective of the actual color model.

The location of the chroma samples relative to the luma coordinates is determined by the `xChromaOffset` and `yChromaOffset` members of the `VkSamplerYcbcrConversionCreateInfo` structure used to create the sampler Y’C<sub>B</sub>C<sub>R</sub> conversion.

The following diagrams show the relationship between unnormalized  $(u,v)$  coordinates and  $(i,j)$  integer texel positions in the luma channel (shown in black, with circles showing integer sample positions) and the texel coordinates of reduced-resolution chroma channels, shown as crosses in red.

**Note**

If the chroma values are reconstructed at the locations of the luma samples by means of interpolation, chroma samples from outside the image bounds are needed; these are determined according to [Wrapping Operation](#). These diagrams represent this by showing the bounds of the “chroma texel” extending beyond the image bounds, and including additional chroma sample positions where required for interpolation. The limits of a sample for **NEAREST** sampling is shown as a grid.

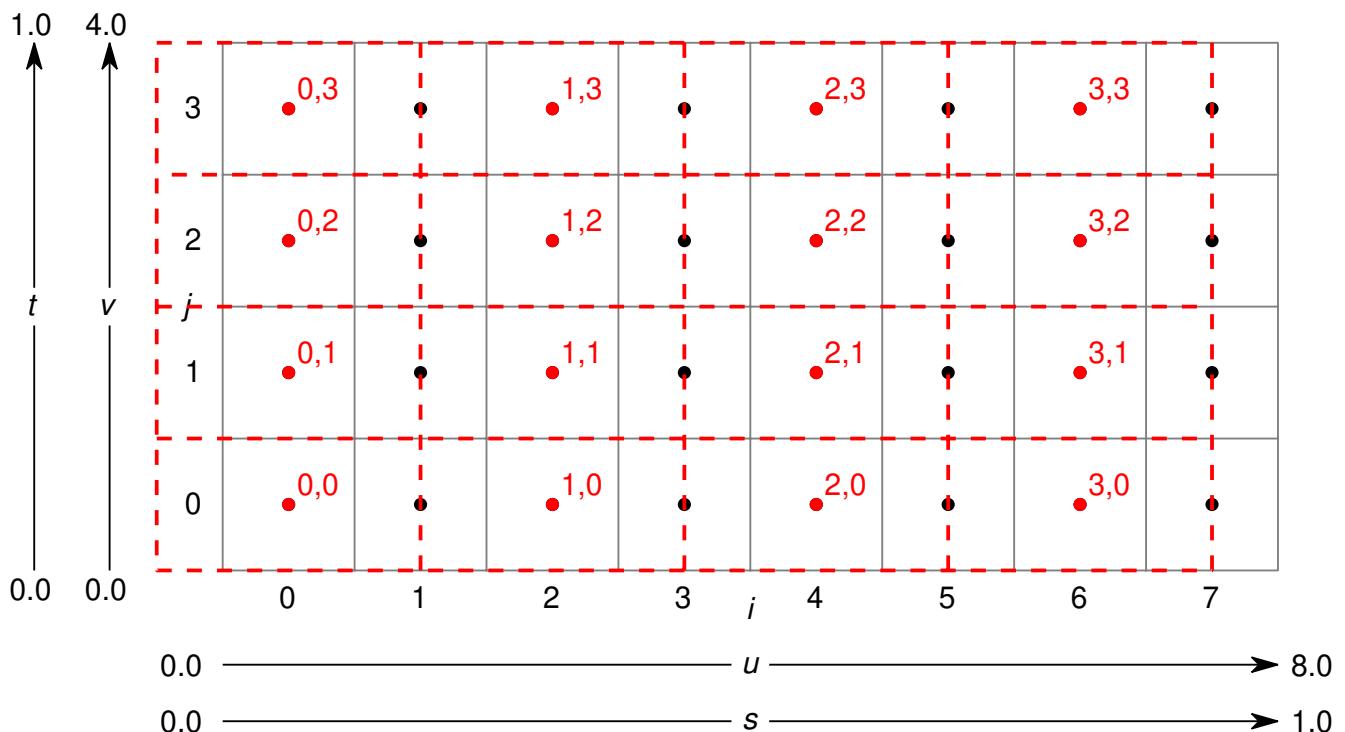

Figure 6. 422 downsampling,  $xChromaOffset=COSITED\_EVEN$

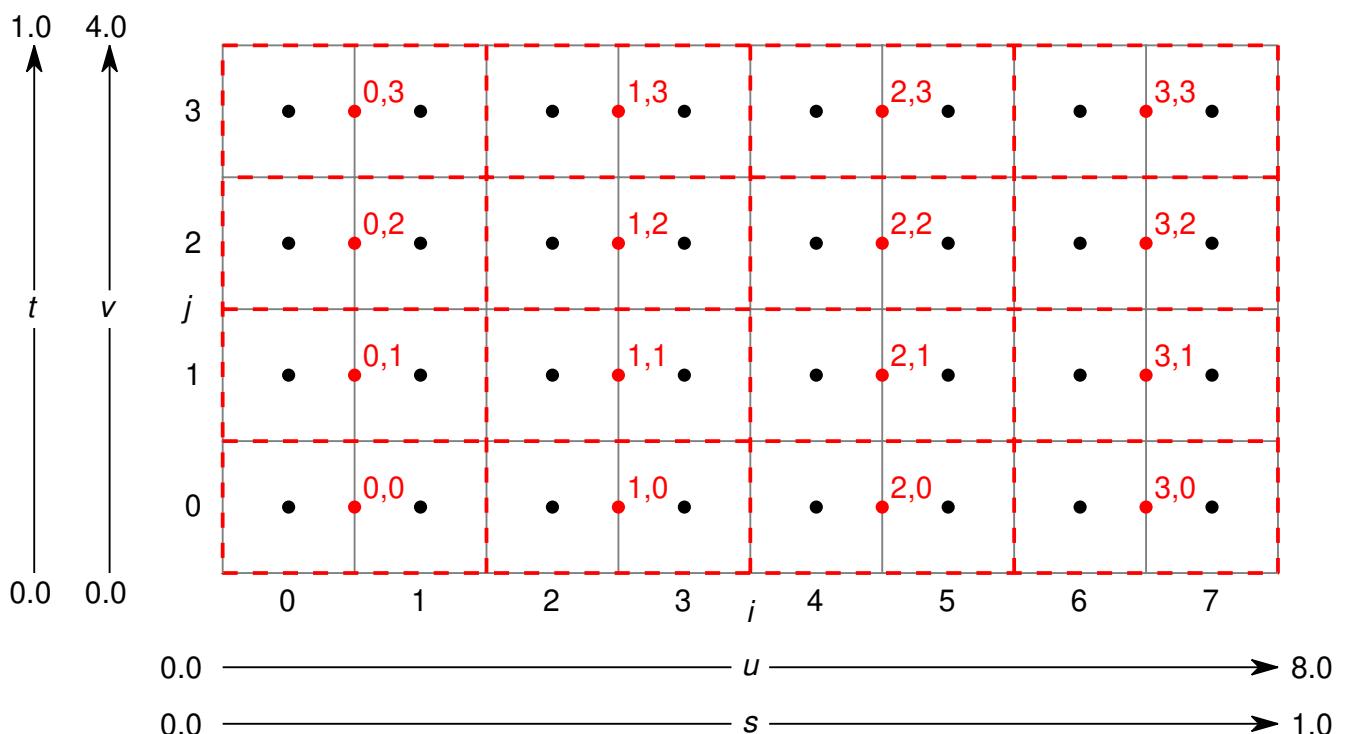

Figure 7. 422 downsampling,  $xChromaOffset=MIDPOINT$

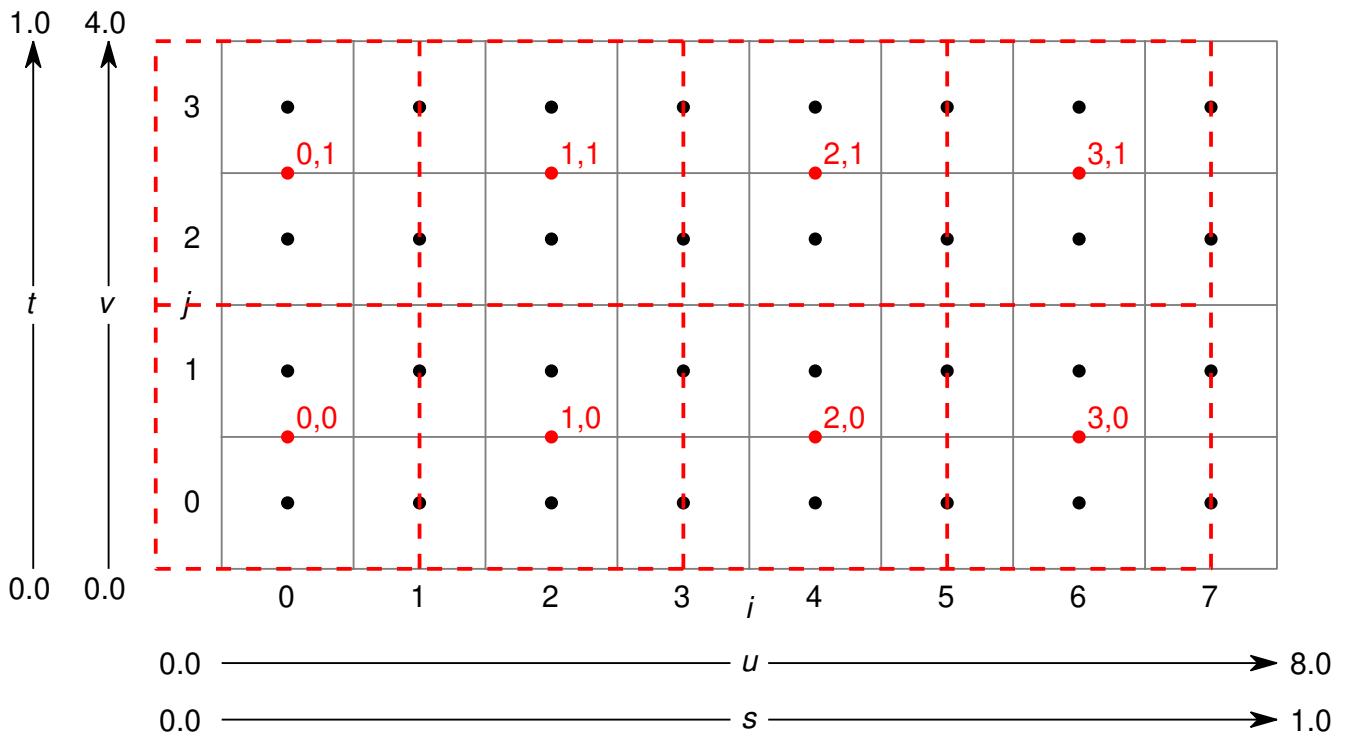

Figure 10. 420 downsampling, `xChromaOffset=COSITED_EVEN`, `yChromaOffset=MIDPOINT`

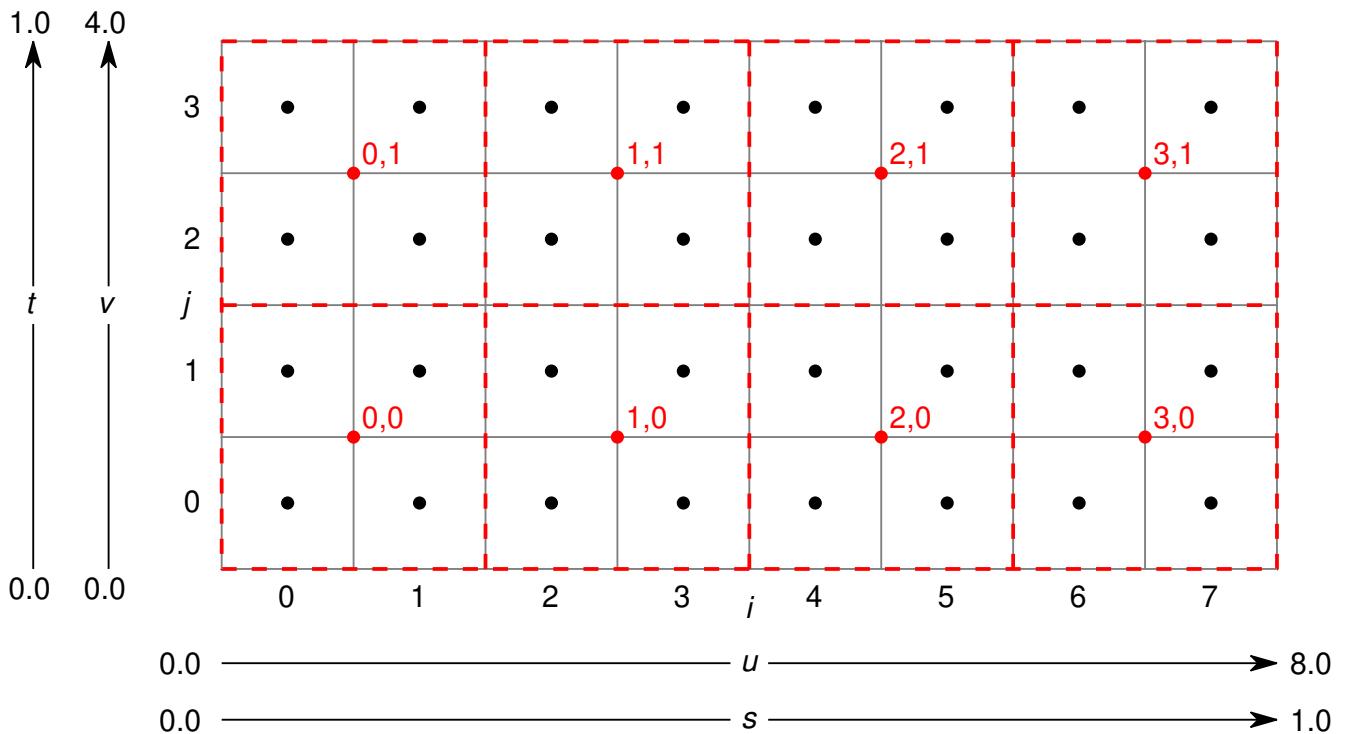

Figure 11. 420 downsampling, `xChromaOffset=MIDPOINT`, `yChromaOffset=MIDPOINT`

Reconstruction is implemented in one of two ways:

If the format of the image that is to be sampled sets `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT`, or the `VkSamplerYcbcrConversionCreateInfo`'s `forceExplicitReconstruction` is set to `VK_TRUE`, reconstruction is performed as an explicit step independent of filtering, described in the [Explicit Reconstruction](#) section.

If the format of the image that is to be sampled does not set `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` and if the `VkSamplerYcbcrConversionCreateInfo`'s `forceExplicitReconstruction` is set to `VK_FALSE`, reconstruction is performed as an implicit part of filtering prior to color model conversion, with no separate post-conversion texel filtering step, as described in the [Implicit Reconstruction](#) section.

## Explicit Reconstruction

- If the `chromaFilter` member of the `VkSamplerYcbcrConversionCreateInfo` structure is `VK_FILTER_NEAREST`:
  - If the format's R and B channels are reduced in resolution in just width by a factor of two relative to the G channel (i.e. this is a “`_422`” format), the  $\tau_{ijk}[level]$  values accessed by `texel filtering` are reconstructed as follows:

$$\begin{aligned}\tau_R'(i, j) &= \tau_R(\lfloor i \times 0.5 \rfloor, j)[level] \\ \tau_B'(i, j) &= \tau_B(\lfloor i \times 0.5 \rfloor, j)[level]\end{aligned}$$

- If the format's R and B channels are reduced in resolution in width and height by a factor of two relative to the G channel (i.e. this is a “`_420`” format), the  $\tau_{ijk}[level]$  values accessed by `texel filtering` are reconstructed as follows:

$$\begin{aligned}\tau_R'(i, j) &= \tau_R(\lfloor i \times 0.5 \rfloor, \lfloor j \times 0.5 \rfloor)[level] \\ \tau_B'(i, j) &= \tau_B(\lfloor i \times 0.5 \rfloor, \lfloor j \times 0.5 \rfloor)[level]\end{aligned}$$

*Note*

`xChromaOffset` and `yChromaOffset` have no effect if `chromaFilter` is `VK_FILTER_NEAREST` for explicit reconstruction.

- If the `chromaFilter` member of the `VkSamplerYcbcrConversionCreateInfo` structure is `VK_FILTER_LINEAR`:
  - If the format's R and B channels are reduced in resolution in just width by a factor of two relative to the G channel (i.e. this is a “`422`” format):
    - If `xChromaOffset` is `VK_CHROMA_LOCATION_COSITED_EVEN`:

$$\tau_{RB}'(i, j) = \begin{cases} \tau_{RB}(\lfloor i \times 0.5 \rfloor, j)[level], & 0.5 \times i = \lfloor 0.5 \times i \rfloor \\ 0.5 \times \tau_{RB}(\lfloor i \times 0.5 \rfloor, j)[level] + \\ 0.5 \times \tau_{RB}(\lfloor i \times 0.5 \rfloor + 1, j)[level], & 0.5 \times i \neq \lfloor 0.5 \times i \rfloor \end{cases}$$

- If `xChromaOffset` is `VK_CHROMA_LOCATION_MIDPOINT`:

$$\tau_{RB}(i, j)' = \begin{cases} 0.25 \times \tau_{RB}(\lfloor i \times 0.5 \rfloor - 1, j)[level] + \\ 0.75 \times \tau_{RB}(\lfloor i \times 0.5 \rfloor, j)[level], & 0.5 \times i = \lfloor 0.5 \times i \rfloor \\ 0.75 \times \tau_{RB}(\lfloor i \times 0.5 \rfloor, j)[level] + \\ 0.25 \times \tau_{RB}(\lfloor i \times 0.5 \rfloor + 1, j)[level], & 0.5 \times i \neq \lfloor 0.5 \times i \rfloor \end{cases}$$

- If the format's R and B channels are reduced in resolution in width and height by a factor of two relative to the G channel (i.e. this is a “`420`” format), a similar relationship applies. Due to the number of options, these formulae are expressed more concisely as follows:

$$i_{RB} = \begin{cases} 0.5 \times (i) & \text{If} \text{fxChromaOffset}=\text{COSITED\_EVEN} \\ 0.5 \times (i - 0.5) & \text{If} \text{fxChromaOffset}=\text{MIDPOINT} \end{cases}$$

$$j_{RB} = \begin{cases} 0.5 \times (j) & \text{If} \text{fyChromaOffset}=\text{COSITED\_EVEN} \\ 0.5 \times (j - 0.5) & \text{If} \text{fyChromaOffset}=\text{MIDPOINT} \end{cases}$$

$$i_{floor} = \lfloor i_{RB} \rfloor$$

$$j_{floor} = \lfloor j_{RB} \rfloor$$

$$i_{frac} = i_{RB} - i_{floor}$$

$$j_{frac} = j_{RB} - j_{floor}$$

$$\begin{aligned} \tau_{RB}'(i, j) &= \tau_{RB}(i_{floor}, j_{floor})[level] && \times (1 - i_{frac}) && \times (1 - j_{frac}) + \\ &\quad \tau_{RB}(1 + i_{floor}, j_{floor})[level] && \times (i_{frac}) && \times (1 - j_{frac}) + \\ &\quad \tau_{RB}(i_{floor}, 1 + j_{floor})[level] && \times (1 - i_{frac}) && \times (j_{frac}) + \\ &\quad \tau_{RB}(1 + i_{floor}, 1 + j_{floor})[level] && \times (i_{frac}) && \times (j_{frac}) \end{aligned}$$

#### Note

In the case where the texture itself is bilinearly interpolated as described in [Texel Filtering](#), thus requiring four full-color samples for the filtering operation, and where the reconstruction of these samples uses bilinear interpolation in the chroma channels due to `chromaFilter=VK_FILTER_LINEAR`, up to nine chroma samples may be required, depending on the sample location.

### Implicit Reconstruction

Implicit reconstruction takes place by the samples being interpolated, as required by the filter settings of the sampler, except that `chromaFilter` takes precedence for the chroma samples.

If `chromaFilter` is `VK_FILTER_NEAREST`, an implementation **may** behave as if `xChromaOffset` and `yChromaOffset` were both `VK_CHROMA_LOCATION_MIDPOINT`, irrespective of the values set.

#### Note

This will not have any visible effect if the locations of the luma samples coincide with the location of the samples used for rasterization.

The sample coordinates are adjusted by the downsample factor of the channel (such that, for example, the sample coordinates are divided by two if the channel has a downsample factor of two relative to the luma channel):

$$u_{RB}'(422 / 420) = \begin{cases} 0.5 \times (u + 0.5), & \text{xChromaOffset}=\text{COSITED\_EVEN} \\ 0.5 \times u, & \text{xChromaOffset}=\text{MIDPOINT} \end{cases}$$

$$v_{RB}'(420) = \begin{cases} 0.5 \times (v + 0.5), & \text{yChromaOffset}=\text{COSITED\_EVEN} \\ 0.5 \times v, & \text{yChromaOffset}=\text{MIDPOINT} \end{cases}$$

### 15.3.9. Sampler Y'CBC<sub>R</sub> Conversion

Sampler Y'CBC<sub>R</sub> conversion performs the following operations, which an implementation **may** combine into a single mathematical operation:

- Sampler Y'CBC<sub>R</sub> Range Expansion

- Sampler Y'CbCr Model Conversion

## Sampler Y'CbCr Range Expansion

Sampler Y'CbCr range expansion is applied to color channel values after all texel input operations which are not specific to sampler Y'CbCr conversion. For example, the input values to this stage have been converted using the normal [format conversion](#) rules.

Sampler Y'CbCr range expansion is not applied if `ycbcrModel` is `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY`. That is, the shader receives the vector  $C'_{rgba}$  as output by the Component Swizzle stage without further modification.

For other values of `ycbcrModel`, range expansion is applied to the texel channel values output by the [Component Swizzle](#) defined by the `components` member of [`VkSamplerYcbcrConversionCreateInfo`](#). Range expansion applies independently to each channel of the image. For the purposes of range expansion and Y'CbCr model conversion, the R and B channels contain color difference (chroma) values and the G channel contains luma. The A channel is not modified by sampler Y'CbCr range expansion.

The range expansion to be applied is defined by the `ycbcrRange` member of the [`VkSamplerYcbcrConversionCreateInfo`](#) structure:

- If `ycbcrRange` is `VK_SAMPLER_YCBCR_RANGE_ITU_FULL`, the following transformations are applied:

$$\begin{aligned} Y' &= C'_{rgba}[G] \\ C_B &= C'_{rgba}[B] - \frac{2^{(n-1)}}{(2^n)-1} \\ C_R &= C'_{rgba}[R] - \frac{2^{(n-1)}}{(2^n)-1} \end{aligned}$$

### Note

These formulae correspond to the “full range” encoding in the [Khronos Data Format Specification](#).

Should any future amendments be made to the ITU specifications from which these equations are derived, the formulae used by Vulkan **may** also be updated to maintain parity.

- If `ycbcrRange` is `VK_SAMPLER_YCBCR_RANGE_ITU_NARROW`, the following transformations are applied:

$$\begin{aligned} Y' &= \frac{C'_{rgba}[G] \times (2^n-1) - 16 \times 2^n - 8}{219 \times 2^{n-8}} \\ C_B &= \frac{C'_{rgba}[B] \times (2^n-1) - 128 \times 2^{n-8}}{224 \times 2^{n-8}} \\ C_R &= \frac{C'_{rgba}[R] \times (2^n-1) - 128 \times 2^{n-8}}{224 \times 2^{n-8}} \end{aligned}$$

### Note

These formulae correspond to the “narrow range” encoding in the [Khronos Data Format Specification](#).

- $n$  is the bit-depth of the channels in the format.

The precision of the operations performed during range expansion **must** be at least that of the source format.

An implementation **may** clamp the results of these range expansion operations such that  $Y'$  falls in the range [0,1], and/or such that  $C_B$  and  $C_R$  fall in the range [-0.5,0.5].

### **Sampler $Y'C_BC_R$ Model Conversion**

The range-expanded values are converted between color models, according to the color model conversion specified in the `ycbcrModel` member:

#### **`VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY`**

The color channels are not modified by the color model conversion since they are assumed already to represent the desired color model in which the shader is operating;  $Y'C_BC_R$  range expansion is also ignored.

#### **`VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY`**

The color channels are not modified by the color model conversion and are assumed to be treated as though in  $Y'C_BC_R$  form both in memory and in the shader;  $Y'C_BC_R$  range expansion is applied to the channels as for other  $Y'C_BC_R$  models, with the vector ( $C_R, Y', C_B, A$ ) provided to the shader.

#### **`VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709`**

The color channels are transformed from a  $Y'C_BC_R$  representation to an  $R'G'B'$  representation as described in the “BT.709  $Y'C_BC_R$  conversion” section of the [Khronos Data Format Specification](#).

#### **`VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601`**

The color channels are transformed from a  $Y'C_BC_R$  representation to an  $R'G'B'$  representation as described in the “BT.601  $Y'C_BC_R$  conversion” section of the [Khronos Data Format Specification](#).

#### **`VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020`**

The color channels are transformed from a  $Y'C_BC_R$  representation to an  $R'G'B'$  representation as described in the “BT.2020  $Y'C_BC_R$  conversion” section of the [Khronos Data Format Specification](#).

In this operation, each output channel is dependent on each input channel.

An implementation **may** clamp the  $R'G'B'$  results of these conversions to the range [0,1].

The precision of the operations performed during model conversion **must** be at least that of the source format.

The alpha channel is not modified by these model conversions.

#### Note

Sampling operations in a non-linear color space can introduce color and intensity shifts at sharp transition boundaries. To avoid this issue, the technically precise color correction sequence described in the “Introduction to Color Conversions” chapter of the [Khronos Data Format Specification](#) may be performed as follows:

- Calculate the [unnormalized texel coordinates](#) corresponding to the desired sample position.
- For a [minFilter/magFilter](#) of [VK\\_FILTER\\_NEAREST](#):
  1. Calculate  $(i,j)$  for the sample location as described under the “nearest filtering” formulae in [\(u,v,w,a\) to \(i,j,k,l,n\) Transformation And Array Layer Selection](#)
  2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
  3. Sample using [sampler Y'CbCr conversion](#) at this location.
- For a [minFilter/magFilter](#) of [VK\\_FILTER\\_LINEAR](#):
  1. Calculate  $(i_{[0,1]},j_{[0,1]})$  for the sample location as described under the “linear filtering” formulae in [\(u,v,w,a\) to \(i,j,k,l,n\) Transformation And Array Layer Selection](#)
  2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
  3. Sample using [sampler Y'CbCr conversion](#) at each of these locations.
  4. Convert the non-linear AR'G'B' outputs of the Y'CbCr conversions to linear ARGB values as described in the “Transfer Functions” chapter of the [Khronos Data Format Specification](#).
  5. Interpolate the linear ARGB values using the  $\alpha$  and  $\beta$  values described in the “linear filtering” section of [\(u,v,w,a\) to \(i,j,k,l,n\) Transformation And Array Layer Selection](#) and the equations in [Texel Filtering](#).

The additional calculations and, especially, additional number of sampling operations in the [VK\\_FILTER\\_LINEAR](#) case can be expected to have a performance impact compared with using the outputs directly; since the variation from “correct” results are subtle for most content, the application author should determine whether a more costly implementation is strictly necessary. Note that if [chromaFilter](#) and [minFilter/magFilter](#) are both [VK\\_FILTER\\_NEAREST](#), these operations are redundant and sampling using [sampler Y'CbCr conversion](#) at the desired sample coordinates will produce the “correct” results without further processing.

## 15.4. Texel Output Operations

*Texel output instructions* are SPIR-V image instructions that write to an image. *Texel output operations* are a set of steps that are performed on state, coordinates, and texel values while processing a texel output instruction, and which are common to some or all texel output

instructions. They include the following steps, which are performed in the listed order:

- Validation operations
  - Format validation
  - Coordinate validation
  - Sparse validation
- Texel output format conversion

### 15.4.1. Texel Output Validation Operations

*Texel output validation operations* inspect instruction/image state or coordinates, and in certain circumstances cause the write to have no effect. There are a series of validations that the texel undergoes.

#### Texel Format Validation

If the image format of the [OpTypeImage](#) is not compatible with the [VkImageView](#)'s [format](#), the write causes the contents of the image's memory to become undefined.

#### 15.4.2. Integer Texel Coordinate Validation

The integer texel coordinates are validated according to the same rules as for texel input [coordinate validation](#).

If the texel fails integer texel coordinate validation, then the write has no effect.

#### 15.4.3. Sparse Texel Operation

If the texel attempts to write to an unbound region of a sparse image, the texel is a sparse unbound texel. In such a case, if the [VkPhysicalDeviceSparseProperties::residencyNonResidentStrict](#) property is [VK\\_TRUE](#), the sparse unbound texel write has no effect. If [residencyNonResidentStrict](#) is [VK\\_FALSE](#), the write **may** have a side effect that becomes visible to other accesses to unbound texels in any resource, but will not be visible to any device memory allocated by the application.

#### 15.4.4. Texel Output Format Conversion

If the image format is sRGB, a linear to sRGB conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the [Kronos Data Format Specification](#). The A component, if present, is unchanged.

Texels then undergo a format conversion from the floating point, signed, or unsigned integer type of the texel data to the [VkFormat](#) of the image view. Any unused components are ignored.

Each component is converted based on its type and size (as defined in the [Format Definition](#) section for each [VkFormat](#)). Floating-point outputs are converted as described in [Floating-Point Format Conversions](#) and [Fixed-Point Data Conversion](#). Integer outputs are converted such that their value is preserved. The converted value of any integer that cannot be represented in the target format is undefined.

## 15.5. Derivative Operations

SPIR-V derivative instructions include `OpDPdx`, `OpDPdy`, `OpDPdxFine`, `OpDPdyFine`, `OpDPdxCoarse`, and `OpDPdyCoarse`. Derivative instructions are only available in compute and fragment shaders.

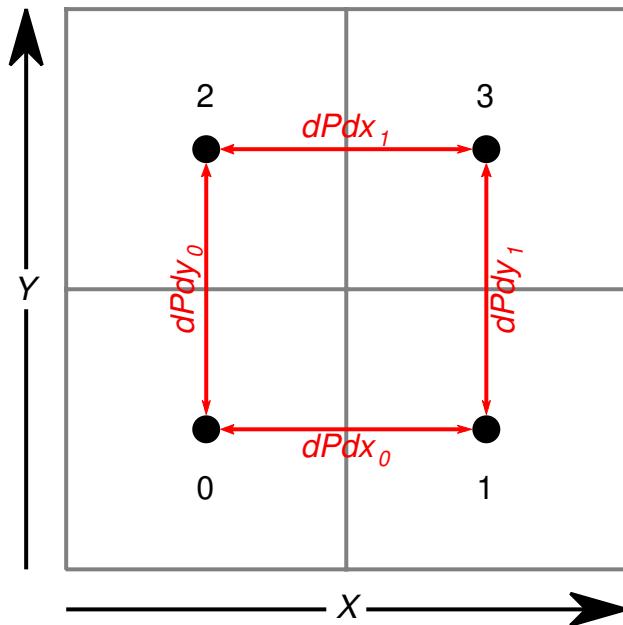

Figure 12. Implicit Derivatives

Derivatives are computed as if there is a  $2 \times 2$  neighborhood of fragments for each fragment shader invocation. These neighboring fragments are used to compute derivatives with the assumption that the values of P in the neighborhood are piecewise linear. It is further assumed that the values of P in the neighborhood are locally continuous. Applications **must** not use derivative instructions in non-uniform control flow.

$$\begin{aligned}dPdx_0 &= P_{i_1, j_0} - P_{i_0, j_0} \\dPdx_1 &= P_{i_1, j_1} - P_{i_0, j_1} \\dPdy_0 &= P_{i_0, j_1} - P_{i_0, j_0} \\dPdy_1 &= P_{i_1, j_1} - P_{i_1, j_0}\end{aligned}$$

For a  $2 \times 2$  neighborhood, for the four fragments labeled 0, 1, 2 and 3, the **Fine** derivative instructions **must** return:

$$\begin{aligned}dPdx &= \begin{cases} dPdx_0 & \text{for fragments labeled 0 and 1} \\ dPdx_1 & \text{for fragments labeled 2 and 3} \end{cases} \\dPdy &= \begin{cases} dPdy_0 & \text{for fragments labeled 0 and 2} \\ dPdy_1 & \text{for fragments labeled 1 and 3} \end{cases}\end{aligned}$$

Coarse derivatives **may** return only two values. In this case, the values **should** be:

$$\begin{aligned}dPdx &= \begin{cases} dPdx_0 & \text{preferred} \\ dPdx_1 \end{cases} \\dPdy &= \begin{cases} dPdy_0 & \text{preferred} \\ dPdy_1 \end{cases}\end{aligned}$$

`OpDPdx` and `OpDPdy` **must** return the same result as either `OpDPdxFine` or `OpDPdxCoarse` and either

`OpDPdyFine` or `OpDPdyCoarse`, respectively. Implementations **must** make the same choice of either coarse or fine for both `OpDPdx` and `OpDPdy`, and implementations **should** make the choice that is more efficient to compute.

If the `subgroupSize` field of `VkPhysicalDeviceSubgroupProperties` is at least 4, the  $2 \times 2$  neighborhood of fragments corresponds exactly to a subgroup quad. The order in which the fragments appear within the quad is implementation defined.

### 15.5.1. Compute Shader Derivatives

For compute shaders, derivatives are also evaluated using a  $2 \times 2$  logical neighborhood of compute shader invocations. Compute shader invocations are arranged into neighborhoods according to one of two SPIR-V execution modes. For the `DerivativeGroupQuadsNV` execution mode, each neighborhood is assembled from a  $2 \times 2 \times 1$  region of invocations based on the `LocalInvocationId` built-in. For the `DerivativeGroupLinearNV` execution mode, each neighborhood is assembled from a group of four invocations based on the `LocalInvocationIndex` built-in. The [Compute shader derivative group assignments](#) table specifies the `LocalInvocationId` or `LocalInvocationIndex` values for the four values of P in each neighborhood, where x and y are per-neighborhood integer values.

*Table 25. Compute shader derivative group assignments*

Value	<code>DerivativeGroupQuadsNV</code>	<code>DerivativeGroupLinearNV</code>
$P_{i0,j0}$	$(2x + 0, 2y + 0, z)$	$4x + 0$
$P_{i1,j0}$	$(2x + 1, 2y + 0, z)$	$4x + 1$
$P_{i0,j1}$	$(2x + 0, 2y + 1, z)$	$4x + 2$
$P_{i1,j1}$	$(2x + 1, 2y + 1, z)$	$4x + 3$

For multi-planar formats, the derivatives are computed based on the plane with the largest dimensions.

## 15.6. Normalized Texel Coordinate Operations

If the image sampler instruction provides normalized texel coordinates ( $s, t, r, q, a$ ) and (if present) the  $D_{ref}$  coordinate are transformed as follows:

$$\begin{aligned} s &= \frac{s}{q}, && \text{for 1D, 2D, or 3D image} \\ t &= \frac{t}{q}, && \text{for 2D or 3D image} \\ r &= \frac{r}{q}, && \text{for 3D image} \\ D_{ref} &= \frac{D_{ref}}{q}, && \text{if provided} \end{aligned}$$

## 15.6.2. Derivative Image Operations

Derivatives are used for LOD selection. These derivatives are either implicit (in an `ImplicitLod` image instruction in a fragment shader) or explicit (provided explicitly by shader to the image instruction in any shader).

For implicit derivatives image instructions, the derivatives of texel coordinates are calculated in the same manner as derivative operations above. That is:

$$\begin{array}{ll} \frac{\partial s}{\partial x} = dPdx(s), & \frac{\partial s}{\partial y} = dPdy(s), \\ \frac{\partial t}{\partial x} = dPdx(t), & \frac{\partial t}{\partial y} = dPdy(t), \\ \frac{\partial u}{\partial x} = dPdx(u), & \frac{\partial u}{\partial y} = dPdy(u), \end{array} \begin{array}{l} \text{for 1D, 2D, Cube, or 3D image} \\ \text{for 2D, Cube, or 3D image} \\ \text{for Cube or 3D image} \end{array}$$

Partial derivatives not defined above for certain image dimensionalities are set to zero.

For explicit LOD image instructions, if the **optional** SPIR-V operand `Grad` is provided, then the operand values are used for the derivatives. The number of components present in each derivative for a given image dimensionality matches the number of partial derivatives computed above.

If the **optional** SPIR-V operand `Lod` is provided, then derivatives are set to zero, the cube map derivative transformation is skipped, and the scale factor operation is skipped. Instead, the floating point scalar coordinate is directly assigned to  $\lambda_{base}$  as described in [Level-of-Detail Operation](#).

For implicit derivative image instructions, the partial derivative values **may** be computed by linear approximation using a  $2 \times 2$  neighborhood of shader invocations (known as a *quad*), as described above. If the instruction is in control flow that is not uniform across the quad, then the derivative values and hence the implicit LOD values are undefined.

If the image or sampler object used by an implicit derivative image instruction is not uniform across the quad and `quadDivergentImplicitLod` is not supported, then the derivative and LOD values are undefined. Implicit derivatives are well-defined when the image and sampler and control flow are uniform across the quad, even if they diverge between different quads.

If `quadDivergentImplicitLod` is supported, then derivatives and implicit LOD values are well-defined even if the image or sampler object are not uniform within a quad. The derivatives are computed as specified above, and the implicit LOD calculation proceeds for each shader invocation using its respective image and sampler object.

For the purposes of implicit derivatives, `Flat` fragment input variables are uniform within a quad.

## 15.6.3. Cube Map Face Selection and Transformations

For cube map image instructions, the  $(s, t, r)$  coordinates are treated as a direction vector  $(r_x, r_y, r_z)$ . The direction vector is used to select a cube map face. The direction vector is transformed to a per-face texel coordinate system  $(s_{face}, t_{face})$ . The direction vector is also used to transform the derivatives to per-face derivatives.

## 15.6.4. Cube Map Face Selection

The direction vector selects one of the cube map's faces based on the largest magnitude coordinate direction (the major axis direction). Since two or more coordinates **can** have identical magnitude,

the implementation **must** have rules to disambiguate this situation.

The rules **should** have as the first rule that  $r_z$  wins over  $r_y$  and  $r_x$ , and the second rule that  $r_y$  wins over  $r_x$ . An implementation **may** choose other rules, but the rules **must** be deterministic and depend only on  $(r_x, r_y, r_z)$ .

The layer number (corresponding to a cube map face), the coordinate selections for  $s_c$ ,  $t_c$ ,  $r_c$ , and the selection of derivatives, are determined by the major axis direction as specified in the following two tables.

*Table 26. Cube map face and coordinate selection*

Major Axis Direction	Layer Number	Cube Map Face	$s_c$	$t_c$	$r_c$
$+r_x$	0	Positive X	$-r_z$	$-r_y$	$r_x$
$-r_x$	1	Negative X	$+r_z$	$-r_y$	$r_x$
$+r_y$	2	Positive Y	$+r_x$	$+r_z$	$r_y$
$-r_y$	3	Negative Y	$+r_x$	$-r_z$	$r_y$
$+r_z$	4	Positive Z	$+r_x$	$-r_y$	$r_z$
$-r_z$	5	Negative Z	$-r_x$	$-r_y$	$r_z$

*Table 27. Cube map derivative selection*

Major Axis Direction	$\partial s_c / \partial x$	$\partial s_c / \partial y$	$\partial t_c / \partial x$	$\partial t_c / \partial y$	$\partial r_c / \partial x$	$\partial r_c / \partial y$
$+r_x$	$-\partial r_z / \partial x$	$-\partial r_z / \partial y$	$-\partial r_y / \partial x$	$-\partial r_y / \partial y$	$+\partial r_x / \partial x$	$+\partial r_x / \partial y$
$-r_x$	$+\partial r_z / \partial x$	$+\partial r_z / \partial y$	$-\partial r_y / \partial x$	$-\partial r_y / \partial y$	$-\partial r_x / \partial x$	$-\partial r_x / \partial y$
$+r_y$	$+\partial r_x / \partial x$	$+\partial r_x / \partial y$	$+\partial r_z / \partial x$	$+\partial r_z / \partial y$	$+\partial r_y / \partial x$	$+\partial r_y / \partial y$
$-r_y$	$+\partial r_x / \partial x$	$+\partial r_x / \partial y$	$-\partial r_z / \partial x$	$-\partial r_z / \partial y$	$-\partial r_y / \partial x$	$-\partial r_y / \partial y$
$+r_z$	$+\partial r_x / \partial x$	$+\partial r_x / \partial y$	$-\partial r_y / \partial x$	$-\partial r_y / \partial y$	$+\partial r_z / \partial x$	$+\partial r_z / \partial y$
$-r_z$	$-\partial r_x / \partial x$	$-\partial r_x / \partial y$	$-\partial r_y / \partial x$	$-\partial r_y / \partial y$	$-\partial r_z / \partial x$	$-\partial r_z / \partial y$

## 15.6.5. Cube Map Coordinate Transformation

$$s_{face} = \frac{1}{2} \times \frac{s_c}{|r_c|} + \frac{1}{2}$$

$$t_{face} = \frac{1}{2} \times \frac{t_c}{|r_c|} + \frac{1}{2}$$

## 15.6.6. Cube Map Derivative Transformation

$$\frac{\partial s_{face}}{\partial x} = \frac{\partial}{\partial x} \left( \frac{1}{2} \times \frac{s_c}{|r_c|} + \frac{1}{2} \right)$$

$$\frac{\partial s_{face}}{\partial x} = \frac{1}{2} \times \frac{\partial}{\partial x} \left( \frac{s_c}{|r_c|} \right)$$

$$\frac{\partial s_{face}}{\partial x} = \frac{1}{2} \times \left( \frac{|r_c| \times \partial s_c / \partial x - s_c \times \partial r_c / \partial x}{(r_c)^2} \right)$$

$$\frac{\partial s_{face}}{\partial y} = \frac{1}{2} \times \left( \frac{|r_c| \times \partial s_c / \partial y - s_c \times \partial r_c / \partial y}{(r_c)^2} \right)$$

$$\frac{\partial t_{face}}{\partial x} = \frac{1}{2} \times \left( \frac{|r_c| \times \partial t_c / \partial x - t_c \times \partial r_c / \partial x}{(r_c)^2} \right)$$

$$\frac{\partial t_{face}}{\partial y} = \frac{1}{2} \times \left( \frac{|r_c| \times \partial t_c / \partial y - t_c \times \partial r_c / \partial y}{(r_c)^2} \right)$$

### 15.6.7. Scale Factor Operation, Level-of-Detail Operation and Image Level(s) Selection

LOD selection **can** be either explicit (provided explicitly by the image instruction) or implicit (determined from a scale factor calculated from the derivatives). The implicit LOD selected **can** be queried using the SPIR-V instruction `OpImageQueryLod`, which gives access to the  $\lambda'$  and  $d_l$  values, defined below. These values **must** be computed with `mipmapPrecisionBits` of accuracy and **may** be subject to implementation-specific maxima and minima for very large, out-of-range values.

#### Scale Factor Operation

The magnitude of the derivatives are calculated by:

$$m_{ux} = |\partial s/\partial x| \times w_{base}$$

$$m_{vx} = |\partial t/\partial x| \times h_{base}$$

$$m_{wx} = |\partial r/\partial x| \times d_{base}$$

$$m_{uy} = |\partial s/\partial y| \times w_{base}$$

$$m_{vy} = |\partial t/\partial y| \times h_{base}$$

$$m_{wy} = |\partial r/\partial y| \times d_{base}$$

where:

$$\partial t/\partial x = \partial t/\partial y = 0 \text{ (for 1D images)}$$

$$\partial r/\partial x = \partial r/\partial y = 0 \text{ (for 1D, 2D or Cube images)}$$

and:

$$w_{base} = \text{image.w}$$

$h_{base} = \text{image}.h$

$d_{base} = \text{image}.d$

(for the `baseMipLevel`, from the image descriptor).

For corner-sampled images, the  $w_{base}$ ,  $h_{base}$ , and  $d_{base}$  are instead:

$w_{base} = \text{image}.w - 1$

$h_{base} = \text{image}.h - 1$

$d_{base} = \text{image}.d - 1$

A point sampled in screen space has an elliptical footprint in texture space. The minimum and maximum scale factors ( $\rho_{min}$ ,  $\rho_{max}$ ) **should** be the minor and major axes of this ellipse.

The *scale factors*  $\rho_x$  and  $\rho_y$ , calculated from the magnitude of the derivatives in x and y, are used to compute the minimum and maximum scale factors.

$\rho_x$  and  $\rho_y$  **may** be approximated with functions  $f_x$  and  $f_y$ , subject to the following constraints:

$f_x$  is continuous and monotonically increasing in each of  $m_{ux}$ ,  $m_{vx}$ , and  $m_{wx}$   
 $f_y$  is continuous and monotonically increasing in each of  $m_{uy}$ ,  $m_{vy}$ , and  $m_{wy}$

$$\begin{aligned} \max(|m_{ux}|, |m_{vx}|, |m_{wx}|) &\leq f_x \leq \sqrt{2}(|m_{ux}| + |m_{vx}| + |m_{wx}|) \\ \max(|m_{uy}|, |m_{vy}|, |m_{wy}|) &\leq f_y \leq \sqrt{2}(|m_{uy}| + |m_{vy}| + |m_{wy}|) \end{aligned}$$

The minimum and maximum scale factors ( $\rho_{min}$ ,  $\rho_{max}$ ) are determined by:

$\rho_{max} = \max(\rho_x, \rho_y)$

$\rho_{min} = \min(\rho_x, \rho_y)$

The ratio of anisotropy is determined by:

$\eta = \min(\rho_{max}/\rho_{min}, \text{max}_{\text{Aniso}})$

where:

`sampler.maxAniso` = `maxAnisotropy` (from sampler descriptor)

`limits.maxAniso` = `maxSamplerAnisotropy` (from physical device limits)

$\text{max}_{\text{Aniso}} = \min(\text{sampler}.max_{\text{Aniso}}, \text{limits}.max_{\text{Aniso}})$

If  $\rho_{max} = \rho_{min} = 0$ , then all the partial derivatives are zero, the fragment's footprint in texel space is a point, and  $N$  **should** be treated as 1. If  $\rho_{max} \neq 0$  and  $\rho_{min} = 0$  then all partial derivatives along one axis are zero, the fragment's footprint in texel space is a line segment, and  $\eta$  **should** be treated as

$\max_{\text{Aniso}}$ . However, anytime the footprint is small in texel space the implementation **may** use a smaller value of  $\eta$ , even when  $\rho_{\min}$  is zero or close to zero. If either `VkPhysicalDeviceFeatures::samplerAnisotropy` or `VkSamplerCreateInfo::anisotropyEnable` are `VK_FALSE`,  $\max_{\text{Aniso}}$  is set to 1.

If  $\eta = 1$ , sampling is isotropic. If  $\eta > 1$ , sampling is anisotropic.

The sampling rate ( $N$ ) is derived as:

$$N = \eta$$

An implementation **may** round  $N$  up to the nearest supported sampling rate. An implementation **may** use the value of  $N$  as an approximation of  $\eta$ .

## Level-of-Detail Operation

The LOD parameter  $\lambda$  is computed as follows:

$$\begin{aligned} \lambda_{\text{base}}(x, y) &= \begin{cases} \text{shaderOp.Lod} & (\text{from optional SPIR-V operand}) \\ \log_2\left(\frac{\rho_{\max}}{\eta}\right) & \text{otherwise} \end{cases} \\ \lambda'(x, y) &= \lambda_{\text{base}} + \text{clamp}(\text{sampler.bias} + \text{shaderOp.bias}, -\max_{\text{SamplerLodBias}}, \max_{\text{SamplerLodBias}}) \\ \lambda &= \begin{cases} \text{lod}_{\max}, & \lambda' > \text{lod}_{\max} \\ \lambda', & \text{lod}_{\min} \leq \lambda' \leq \text{lod}_{\max} \\ \text{lod}_{\min}, & \lambda' < \text{lod}_{\min} \\ \text{undefined}, & \text{lod}_{\min} > \text{lod}_{\max} \end{cases} \end{aligned}$$

where:

$$\begin{aligned} \text{sampler.bias} &= \text{mipLodBias} && (\text{from sampler descriptor}) \\ \text{shaderOp.bias} &= \begin{cases} \text{Bias} & (\text{from optional SPIR-V operand}) \\ 0 & \text{otherwise} \end{cases} \\ \text{sampler.lod}_{\min} &= \text{minLod} && (\text{from sampler descriptor}) \\ \text{shaderOp.lod}_{\min} &= \begin{cases} \text{MinLod} & (\text{from optional SPIR-V operand}) \\ 0 & \text{otherwise} \end{cases} \\ \text{lod}_{\min} &= \max(\text{sampler.lod}_{\min}, \text{shaderOp.lod}_{\min}) \\ \text{lod}_{\max} &= \text{maxLod} && (\text{from sampler descriptor}) \end{aligned}$$

and  $\max_{\text{SamplerLodBias}}$  is the value of the `VkPhysicalDeviceLimits` feature `maxSamplerLodBias`.

## Image Level(s) Selection

The image level(s)  $d$ ,  $d_{\text{hi}}$ , and  $d_{\text{lo}}$  which texels are read from are determined by an image-level parameter  $d_l$ , which is computed based on the LOD parameter, as follows:

$$d_l = \begin{cases} \text{nearest}(d'), & \text{mipmapMode is VK_SAMPLER_MIPMAP_MODE_NEAREST} \\ d', & \text{otherwise} \end{cases}$$

where:

$$d' = \text{level}_{\text{base}} + \text{clamp}(\lambda, 0, q)$$

$$\text{nearest}(d') = \begin{cases} \lceil d' + 0.5 \rceil - 1, & \text{preferred} \\ \lfloor d' + 0.5 \rfloor, & \text{alternative} \end{cases}$$

and:

```
levelbase = baseMipLevel
```

```
q = levelCount - 1
```

baseMipLevel and levelCount are taken from the subresourceRange of the image view.

If the sampler's mipmapMode is VK\_SAMPLER\_MIPMAP\_MODE\_NEAREST, then the level selected is  $d = d_l$ .

If the sampler's mipmapMode is VK\_SAMPLER\_MIPMAP\_MODE\_LINEAR, two neighboring levels are selected:

$$\begin{aligned}d_{hi} &= \lfloor d_l \rfloor \\d_{lo} &= \min(d_{hi} + 1, q) \\d &= d_l - d_{hi}\end{aligned}$$

$\delta$  is the fractional value, quantized to the number of mipmap precision bits, used for linear filtering between levels.

### 15.6.8. (s,t,r,q,a) to (u,v,w,a) Transformation

The normalized texel coordinates are scaled by the image level dimensions and the array layer is selected.

This transformation is performed once for each level used in filtering (either  $d$ , or  $d_{hi}$  and  $d_{lo}$ ).

$$\begin{aligned}u(x, y) &= s(x, y) \times width_{scale} + \Delta_i \\v(x, y) &= \begin{cases} 0 & \text{for 1D images} \\ t(x, y) \times height_{scale} + \Delta_j & \text{otherwise} \end{cases} \\w(x, y) &= \begin{cases} 0 & \text{for 2D or Cube images} \\ r(x, y) \times depth_{scale} + \Delta_k & \text{otherwise} \end{cases} \\a(x, y) &= \begin{cases} a(x, y) & \text{for array images} \\ 0 & \text{otherwise} \end{cases}\end{aligned}$$

where:

$$width_{scale} = width_{level}$$

$$height_{scale} = height_{level}$$

$$depth_{scale} = depth_{level}$$

for conventional images, and:

$$width_{scale} = width_{level} - 1$$

$$height_{scale} = height_{level} - 1$$

$$depth_{scale} = depth_{level} - 1$$

for corner-sampled images.

and where  $(\Delta_i, \Delta_j, \Delta_k)$  are taken from the image instruction if it includes a `ConstOffset` or `Offset` operand, otherwise they are taken to be zero.

Operations then proceed to Unnormalized Texel Coordinate Operations.

## 15.7. Unnormalized Texel Coordinate Operations

### 15.7.1. (u,v,w,a) to (i,j,k,l,n) Transformation And Array Layer Selection

The unnormalized texel coordinates are transformed to integer texel coordinates relative to the selected mipmap level.

The layer index  $l$  is computed as:

$$l = \text{clamp}(\text{RNE}(a), 0, \text{layerCount} - 1) + \text{baseArrayLayer}$$

where `layerCount` is the number of layers in the image subresource range of the image view, `baseArrayLayer` is the first layer from the subresource range, and where:

$$\text{RNE}(a) = \begin{cases} \text{roundTiesToEven}(a) & \text{preferred, from IEEE Std 754-2008 Floating-Point Arithmetic} \\ \lfloor a + 0.5 \rfloor & \text{alternative} \end{cases}$$

The sample index  $n$  is assigned the value zero.

Nearest filtering (`VK_FILTER_NEAREST`) computes the integer texel coordinates that the unnormalized coordinates lie within:

$$\begin{aligned} i &= \lfloor u + shift \rfloor \\ j &= \lfloor v + shift \rfloor \\ k &= \lfloor w + shift \rfloor \end{aligned}$$

where:

$$\text{shift} = 0.0$$

for conventional images, and:

$$\text{shift} = 0.5$$

for corner-sampled images.

Linear filtering (`VK_FILTER_LINEAR`) computes a set of neighboring coordinates which bound the unnormalized coordinates. The integer texel coordinates are combinations of  $i_0$  or  $i_1$ ,  $j_0$  or  $j_1$ ,  $k_0$  or  $k_1$ , as well as weights  $\alpha$ ,  $\beta$ , and  $\gamma$ .

$$\begin{aligned} i_0 &= \lfloor u - shift \rfloor \\ i_1 &= i_0 + 1 \\ j_0 &= \lfloor v - shift \rfloor \\ j_1 &= j_0 + 1 \\ k_0 &= \lfloor w - shift \rfloor \\ k_1 &= k_0 + 1 \end{aligned}$$

$$\begin{aligned}\alpha &= \text{frac}(u - \text{shift}) \\ \beta &= \text{frac}(v - \text{shift}) \\ \gamma &= \text{frac}(w - \text{shift})\end{aligned}$$

where:

`shift = 0.5`

for conventional images, and:

`shift = 0.0`

for corner-sampled images, and where:

$$\text{frac}(x) = x - \lfloor x \rfloor$$

where the number of fraction bits retained is specified by `VkPhysicalDeviceLimits::subTexelPrecisionBits`.

Cubic filtering (`VK_FILTER_CUBIC_EXT`) computes a set of neighboring coordinates which bound the unnormalized coordinates. The integer texel coordinates are combinations of  $i_0, i_1, i_2$  or  $i_3, j_0, j_1, j_2$  or  $j_3, k_0, k_1, k_2$  or  $k_3$ , as well as weights  $\alpha, \beta$ , and  $\gamma$ .

$$\begin{aligned}i_0 &= \lfloor u - \frac{3}{2} \rfloor & i_1 &= i_0 + 1 & i_2 &= i_1 + 1 & i_3 &= i_2 + 1 \\ j_0 &= \lfloor v - \frac{3}{2} \rfloor & j_1 &= j_0 + 1 & j_2 &= j_1 + 1 & j_3 &= j_2 + 1 \\ k_0 &= \lfloor w - \frac{3}{2} \rfloor & k_1 &= k_0 + 1 & k_2 &= k_1 + 1 & k_3 &= k_2 + 1\end{aligned}$$

$$\begin{aligned}\alpha &= \text{frac}\left(u - \frac{1}{2}\right) \\ \beta &= \text{frac}\left(v - \frac{1}{2}\right) \\ \gamma &= \text{frac}\left(w - \frac{1}{2}\right)\end{aligned}$$

where:

$$\text{frac}(x) = x - \lfloor x \rfloor$$

where the number of fraction bits retained is specified by `VkPhysicalDeviceLimits::subTexelPrecisionBits`.

## 15.8. Integer Texel Coordinate Operations

Integer texel coordinate operations **may** supply a LOD which texels are to be read from or written to using the optional SPIR-V operand `Lod`. If the `Lod` is provided then it **must** be an integer.

The image level selected is:

$$d = level_{base} + \begin{cases} Lod & \text{(from optional SPIR-V operand)} \\ 0 & \text{otherwise} \end{cases}$$

If  $d$  does not lie in the range [`baseMipLevel`, `baseMipLevel` + `levelCount`) then any values fetched are undefined, and any writes are discarded.

## 15.9. Image Sample Operations

### 15.9.1. Wrapping Operation

[Cube](#) images ignore the wrap modes specified in the sampler. Instead, if `VK_FILTER_NEAREST` is used within a mip level then `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` is used, and if `VK_FILTER_LINEAR` is used within a mip level then sampling at the edges is performed as described earlier in the [Cube map edge handling](#) section.

The first integer texel coordinate  $i$  is transformed based on the `addressModeU` parameter of the sampler.

$$i = \begin{cases} i \bmod size & \text{for repeat} \\ (size - 1) - \text{mirror}((i \bmod (2 \times size)) - size) & \text{for mirrored repeat} \\ \text{clamp}(i, 0, size - 1) & \text{for clamp to edge} \\ \text{clamp}(i, -1, size) & \text{for clamp to border} \\ \text{clamp}(\text{mirror}(i), 0, size - 1) & \text{for mirror clamp to edge} \end{cases}$$

where:

$$\text{mirror}(n) = \begin{cases} n & \text{for } n \geq 0 \\ -(1 + n) & \text{otherwise} \end{cases}$$

$j$  (for 2D and Cube image) and  $k$  (for 3D image) are similarly transformed based on the `addressModeV` and `addressModeW` parameters of the sampler, respectively.

### 15.9.2. Texel Gathering

SPIR-V instructions with [Gather](#) in the name return a vector derived from 4 texels in the base level of the image view. The rules for the `VK_FILTER_LINEAR` minification filter are applied to identify the four selected texels. Each texel is then converted to an RGBA value according to [conversion to RGBA](#) and then [swizzled](#). A four-component vector is then assembled by taking the component indicated by the `Component` value in the instruction from the swizzled color value of the four texels. If the operation does not use the `ConstOffsets` image operand then the four texels form the  $2 \times 2$  rectangle used for texture filtering:

$$\begin{aligned} \tau[R] &= \tau_{i0j1}[level_{base}][comp] \\ \tau[G] &= \tau_{i1j1}[level_{base}][comp] \\ \tau[B] &= \tau_{i1j0}[level_{base}][comp] \\ \tau[A] &= \tau_{i0j0}[level_{base}][comp] \end{aligned}$$

If the operation does use the `ConstOffsets` image operand then the offsets allow a custom filter to be defined:

$$\begin{aligned}\tau[R] &= \tau_{i0j0} + \Delta_0[level_{base}][comp] \\ \tau[G] &= \tau_{i0j0} + \Delta_1[level_{base}][comp] \\ \tau[B] &= \tau_{i0j0} + \Delta_2[level_{base}][comp] \\ \tau[A] &= \tau_{i0j0} + \Delta_3[level_{base}][comp]\end{aligned}$$

where:

$$\tau[level_{base}][comp] = \begin{cases} \tau[level_{base}][R], & \text{for } comp = 0 \\ \tau[level_{base}][G], & \text{for } comp = 1 \\ \tau[level_{base}][B], & \text{for } comp = 2 \\ \tau[level_{base}][A], & \text{for } comp = 3 \end{cases}$$

*comp* from SPIR-V operand Component

**OpImage\*Gather** must not be used on a sampled image with **sampler Y'CbCr conversion** enabled.

### 15.9.3. Texel Filtering

Texel filtering is first performed for each level (either  $d$  or  $d_{hi}$  and  $d_{lo}$ ).

If  $\lambda$  is less than or equal to zero, the texture is said to be *magnified*, and the filter mode within a mip level is selected by the **magFilter** in the sampler. If  $\lambda$  is greater than zero, the texture is said to be *minified*, and the filter mode within a mip level is selected by the **minFilter** in the sampler.

#### Texel Nearest Filtering

Within a mip level, **VK\_FILTER\_NEAREST** filtering selects a single value using the  $(i, j, k)$  texel coordinates, with all texels taken from layer 1.

$$\tau[level] = \begin{cases} \tau_{ijk}[level], & \text{for 3D image} \\ \tau_{ij}[level], & \text{for 2D or Cube image} \\ \tau_i[level], & \text{for 1D image} \end{cases}$$

#### Texel Linear Filtering

Within a mip level, **VK\_FILTER\_LINEAR** filtering combines 8 (for 3D), 4 (for 2D or Cube), or 2 (for 1D) texel values, together with their linear weights. The linear weights are derived from the fractions computed earlier:

$$\begin{aligned}w_{i_0} &= (1 - \alpha) \\ w_{i_1} &= (\alpha) \\ w_{j_0} &= (1 - \beta) \\ w_{j_1} &= (\beta) \\ w_{k_0} &= (1 - \gamma) \\ w_{k_1} &= (\gamma)\end{aligned}$$

The values of multiple texels, together with their weights, are combined to produce a filtered value.

The **VkSamplerReductionModeCreateInfoEXT::reductionMode** can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the **reductionMode** is set (explicitly or implicitly) to

`VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_EXT`, a weighted average is computed:

$$\begin{aligned}\tau_{3D} &= \sum_{k=k_0}^{k_1} \sum_{j=j_0}^{j_1} \sum_{i=i_0}^{i_1} (w_i)(w_j)(w_k)\tau_{ijk} \\ \tau_{2D} &= \sum_{j=j_0}^{j_1} \sum_{i=i_0}^{i_1} (w_i)(w_j)\tau_{ij} \\ \tau_{1D} &= \sum_{i=i_0}^{i_1} (w_i)\tau_i\end{aligned}$$

However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN_EXT` or `VK_SAMPLER_REDUCTION_MODE_MAX_EXT`, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the set of texels with non-zero weights.

## Texel Cubic Filtering

Within a mip level, `VK_FILTER_CUBIC_EXT`, filtering computes a weighted average of 64 (for 3D), 16 (for 2D), or 4 (for 1D) texel values, together with their Catmull-Rom weights.

Catmull-Rom weights are derived from the fractions computed earlier.

$$\begin{aligned}[w_{i_0} \ w_{i_1} \ w_{i_2} \ w_{i_3}] &= \frac{1}{2} [1 \ \alpha \ \alpha^2 \ \alpha^3] \begin{bmatrix} 0 & 2 & 0 & 0 \\ -1 & 0 & 1 & 0 \\ 2 & -5 & 4 & -1 \\ -1 & 3 & -3 & 1 \end{bmatrix} \\ [w_{j_0} \ w_{j_1} \ w_{j_2} \ w_{j_3}] &= \frac{1}{2} [1 \ \beta \ \beta^2 \ \beta^3] \begin{bmatrix} 0 & 2 & 0 & 0 \\ -1 & 0 & 1 & 0 \\ 2 & -5 & 4 & -1 \\ -1 & 3 & -3 & 1 \end{bmatrix} \\ [w_{k_0} \ w_{k_1} \ w_{k_2} \ w_{k_3}] &= \frac{1}{2} [1 \ \gamma \ \gamma^2 \ \gamma^3] \begin{bmatrix} 0 & 2 & 0 & 0 \\ -1 & 0 & 1 & 0 \\ 2 & -5 & 4 & -1 \\ -1 & 3 & -3 & 1 \end{bmatrix}\end{aligned}$$

The values of multiple texels, together with their weights, are combined to produce a filtered value.

The `VkSamplerReductionModeCreateInfoEXT::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_EXT`, a weighted average is computed:

$$\begin{aligned}\tau_{3D} &= \sum_{k=k_0}^{k_3} \sum_{j=j_0}^{j_3} \sum_{i=i_0}^{i_3} (w_i)(w_j)(w_k)\tau_{ijk} \\ \tau_{2D} &= \sum_{j=j_0}^{j_3} \sum_{i=i_0}^{i_3} (w_i)(w_j)\tau_{ij} \\ \tau_{1D} &= \sum_{i=i_0}^{i_3} (w_i)\tau_i\end{aligned}$$

However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN_EXT` or `VK_SAMPLER_REDUCTION_MODE_MAX_EXT`, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of

the components of the set of texels with non-zero weights.

## Texel Mipmap Filtering

`VK_SAMPLER_MIPMAP_MODE_NEAREST` filtering returns the value of a single mipmap level,

$$\tau = \tau[d].$$

`VK_SAMPLER_MIPMAP_MODE_LINEAR` filtering combines the values of multiple mipmap levels ( $\tau[hi]$  and  $\tau[lo]$ ), together with their linear weights.

The linear weights are derived from the fraction computed earlier:

$$w_{hi} = (1 - \delta)$$
$$w_{lo} = (\delta)$$

The values of multiple mipmap levels, together with their weights, are combined to produce a final filtered value.

The `VkSamplerReductionModeCreateInfoEXT::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_EXT`, a weighted average is computed:

$$\tau = (w_{hi})\tau[hi] + (w_{lo})\tau[lo]$$

## Texel Anisotropic Filtering

Anisotropic filtering is enabled by the `anisotropyEnable` in the sampler. When enabled, the image filtering scheme accounts for a degree of anisotropy.

The particular scheme for anisotropic texture filtering is implementation dependent. Implementations **should** consider the `magFilter`, `minFilter` and `mipmapMode` of the sampler to control the specifics of the anisotropic filtering scheme used. In addition, implementations **should** consider `minLod` and `maxLod` of the sampler.

The following describes one particular approach to implementing anisotropic filtering for the 2D Image case, implementations **may** choose other methods:

Given a `magFilter`, `minFilter` of `VK_FILTER_LINEAR` and a `mipmapMode` of `VK_SAMPLER_MIPMAP_MODE_NEAREST`:

Instead of a single isotropic sample, N isotropic samples are be sampled within the image footprint of the image level d to approximate an anisotropic filter. The sum  $\tau_{2D_{aniso}}$  is defined using the single isotropic  $\tau_{2D}(u,v)$  at level d.

$$\tau_{2D_{aniso}} = \frac{1}{N} \sum_{i=1}^N \tau_{2D}\left(u\left(x - \frac{1}{2} + \frac{i}{N+1}, y\right), \left(v\left(x - \frac{1}{2} + \frac{i}{N+1}\right), y\right)\right), \quad \text{when } \rho_x > \rho_y$$
$$\tau_{2D_{aniso}} = \frac{1}{N} \sum_{i=1}^N \tau_{2D}\left(u\left(x, y - \frac{1}{2} + \frac{i}{N+1}\right), \left(v\left(x, y - \frac{1}{2} + \frac{i}{N+1}\right)\right)\right), \quad \text{when } \rho_y \geq \rho_x$$

When `VkSamplerReductionModeCreateInfoEXT::reductionMode` is set to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_EXT`, the above summation is used. However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN_EXT` or `VK_SAMPLER_REDUCTION_MODE_MAX_EXT`, the process operates on the above values, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the values with non-zero weights.

## 15.10. Texel Footprint Evaluation

The SPIR-V instruction `OpImageSampleFootprintNV` evaluates the set of texels from a single mip level that would be accessed during a `texel filtering` operation. In addition to the inputs that would be accepted by an equivalent `OpImageSample*` instruction, `OpImageSampleFootprintNV` accepts two additional inputs. The `Granularity` input is an integer identifying the size of texel groups used to evaluate the footprint. Each bit in the returned footprint mask corresponds to an aligned block of texels whose size is given by the following table:

*Table 28. Texel footprint granularity values*

Granularity	Dim = 2D	Dim = 3D
0	unsupported	unsupported
1	2x2	2x2x2
2	4x2	unsupported
3	4x4	4x4x2
4	8x4	unsupported
5	8x8	unsupported
6	16x8	unsupported
7	16x16	unsupported
8	unsupported	unsupported
9	unsupported	unsupported
10	unsupported	16x16x16
11	64x64	32x16x16
12	128x64	32x32x16
13	128x128	32x32x32
14	256x128	64x32x32
15	256x256	unsupported

The `Coarse` input is used to select between the two mip levels that **may** be accessed during texel filtering when using a `mipmapMode` of `VK_SAMPLER_MIPMAP_MODE_LINEAR`. When filtering between two mip levels, a `Coarse` value of `true` requests the footprint in the lower-resolution mip level (higher level number), while `false` requests the footprint in the higher-resolution mip level. If texel filtering would access only a single mip level, the footprint in that level would be returned when `Coarse` is set to `false`; an empty footprint would be returned when `Coarse` is set to `true`.

The footprint for `OpImageSampleFootprintNV` is returned in a structure with six members:

- The first member is a boolean value that is true if the texel filtering operation would access only a single mip level.
- The second member is a two- or three-component integer vector holding the footprint anchor location. For two-dimensional images, the returned components are in units of eight texel groups. For three-dimensional images, the returned components are in units of four texel groups.
- The third member is a two- or three-component integer vector holding a footprint offset relative to the anchor. All returned components are in units of texel groups.
- The fourth member is a two-component integer vector mask, which holds a bitfield identifying the set of texel groups in an 8x8 or 4x4x4 neighborhood relative to the anchor and offset.
- The fifth member is an integer identifying the mip level containing the footprint identified by the anchor, offset, and mask.
- The sixth member is an integer identifying the granularity of the returned footprint.

For footprints in two-dimensional images ([Dim2D](#)), the mask returned by [OpImageSampleFootprintNV](#) indicates whether each texel group in a 8x8 local neighborhood of texel groups would have one or more texels accessed during texel filtering. In the mask, the texel group with local group coordinates ( $lgx, lgy$ ) is considered covered if and only if

$$0 \neq ((mask.x + (mask.y << 32)) \& (1 << (lgy \times 8 + lgx)))$$

where:

- $0 \leq lgx \leq 8$  and  $0 \leq lgy \leq 8$ ; and
- $mask$  is the returned two-component mask.

The local group with coordinates ( $lgx, lgy$ ) in the mask is considered covered if and only if the texel filtering operation would access one or more texels  $\tau_{ij}$  in the returned miplevel where:

$$\begin{aligned} i0 &= \begin{cases} gran.x \times (8 \times anchor.x + lgx), & \text{if } lgx + offset.x < 8 \\ gran.x \times (8 \times (anchor.x - 1) + lgx), & \text{otherwise} \end{cases} \\ i1 &= i0 + gran.x - 1 \\ j0 &= \begin{cases} gran.y \times (8 \times anchor.y + lgy), & \text{if } lgy + offset.y < 8 \\ gran.y \times (8 \times (anchor.y - 1) + lgy), & \text{otherwise} \end{cases} \\ j1 &= j0 + gran.y - 1 \end{aligned}$$

and

- $i0 \leq i \leq i1$  and  $j0 \leq j \leq j1$ ;
- $gran$  is a two-component vector holding the width and height of the texel group identified by the granularity;
- $anchor$  is the returned two-component anchor vector; and
- $offset$  is the returned two-component offset vector.

For footprints in three-dimensional images ([Dim3D](#)), the mask returned by [OpImageSampleFootprintNV](#) indicates whether each texel group in a 4x4x4 local neighborhood of texel groups would have one or more texels accessed during texel filtering. In the mask, the texel group with local group

coordinates  $(lgx, lgy, lgz)$ , is considered covered if and only if:

$$0 \neq ((mask.x + (mask.y \ll 32)) \& (1 \ll (lgz \times 16 + lgy \times 4 + lgx)))$$

where:

- $0 \leq lgx < 4$ ,  $0 \leq lgy < 4$ , and  $0 \leq lgz < 4$ ; and
- *mask* is the returned two-component mask.

The local group with coordinates  $(lgx, lgy, lgz)$  in the mask is considered covered if and only if the texel filtering operation would access one or more texels  $\tau_{ijk}$  in the returned mplevel where:

$$\begin{aligned} i0 &= \begin{cases} gran.x \times (4 \times anchor.x + lgx), & \text{if } lgx + offset.x < 4 \\ gran.x \times (4 \times (anchor.x - 1) + lgx), & \text{otherwise} \end{cases} \\ i1 &= i0 + gran.x - 1 \\ j0 &= \begin{cases} gran.y \times (4 \times anchor.y + lgy), & \text{if } lgy + offset.y < 4 \\ gran.y \times (4 \times (anchor.y - 1) + lgy), & \text{otherwise} \end{cases} \\ j1 &= j0 + gran.y - 1 \\ k0 &= \begin{cases} gran.z \times (4 \times anchor.z + lgz), & \text{if } lgz + offset.z < 4 \\ gran.z \times (4 \times (anchor.z - 1) + lgz), & \text{otherwise} \end{cases} \\ k1 &= k0 + gran.z - 1 \end{aligned}$$

and

- $i0 \leq i \leq i1$ ,  $j0 \leq j \leq j1$ ,  $k0 \leq k \leq k1$ ;
- *gran* is a three-component vector holding the width, height, and depth of the texel group identified by the granularity;
- *anchor* is the returned three-component anchor vector; and
- *offset* is the returned three-component offset vector.

If the sampler used by `OpImageSampleFootprintNV` enables anisotropic texel filtering via `anisotropyEnable`, it is possible that the set of texel groups accessed in a mip level may be too large to be expressed using an 8x8 or 4x4x4 mask using the granularity requested in the instruction. In this case, the implementation uses a texel group larger than the requested granularity. When a larger texel group size is used, `OpImageSampleFootprintNV` returns an integer granularity value that **can** be interpreted in the same manner as the granularity value provided to the instruction to determine the texel group size used. If anisotropic texel filtering is disabled in the sampler, or if an anisotropic footprint can be represented as an 8x8 or 4x4x4 mask with the requested granularity, `OpImageSampleFootprintNV` will use the requested granularity as-is and return a granularity value of zero.

`OpImageSampleFootprintNV` supports only two- and three-dimensional image accesses (`Dim2D` and `Dim3D`) and the footprint returned is undefined if a sampler uses an addressing mode other than `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

## 15.11. Image Operation Steps

Each step described in this chapter is performed by a subset of the image instructions:

- Texel Input Validation Operations, Format Conversion, Texel Replacement, Conversion to RGBA, and Component Swizzle: Performed by all instructions except `OpImageWrite`.
- Depth Comparison: Performed by `OpImage*Dref` instructions.
- All Texel output operations: Performed by `OpImageWrite`.
- Projection: Performed by all `OpImage*Proj` instructions.
- Derivative Image Operations, Cube Map Operations, Scale Factor Operation, Level-of-Detail Operation and Image Level(s) Selection, and Texel Anisotropic Filtering: Performed by all `OpImageSample*` and `OpImageSparseSample*` instructions.
- (s,t,r,q,a) to (u,v,w,a) Transformation, Wrapping, and (u,v,w,a) to (i,j,k,l,n) Transformation And Array Layer Selection: Performed by all `OpImageSample`, `OpImageSparseSample`, and `OpImage*Gather` instructions.
- Texel Gathering: Performed by `OpImage*Gather` instructions.
- Texel Footprint Evaluation: Performed by `OpImageSampleFootprint` instructions.
- Texel Filtering: Performed by all `OpImageSample*` and `OpImageSparseSample*` instructions.
- Sparse Residency: Performed by all `OpImageSparse*` instructions.

# Chapter 16. Fragment Density Map Operations

## 16.1. Fragment Density Map Operations Overview

When a fragment is generated in a render pass that has a fragment density map attachment, its area is determined by the properties of the local framebuffer region that the fragment occupies. The framebuffer is divided into a uniform grid of these local regions, and their fragment area property is derived from the density map with the following operations:

- Fetch density value
  - Component swizzle
  - Component mapping
- Fragment area conversion
  - Fragment area filter
  - Fragment area clamp

## 16.2. Fetch Density Value

Each local framebuffer region at center coordinate (x,y) fetches a texel from the fragment density map at integer coordinates:

$$i = \lfloor \frac{x}{fragmentDensityTexelSize_{width}} \rfloor$$

$$j = \lfloor \frac{y}{fragmentDensityTexelSize_{height}} \rfloor$$

Where the size of each region in the framebuffer is:

$$fragmentDensityTexelSize_{width} = 2^{\lceil \log_2(\frac{framebuffer_{width}}{fragmentDensityMap_{width}}) \rceil}$$

$$fragmentDensityTexelSize_{height} = 2^{\lceil \log_2(\frac{framebuffer_{height}}{fragmentDensityMap_{height}}) \rceil}$$

This region is subject to the limits in `VkPhysicalDeviceFragmentDensityMapPropertiesEXT` and therefore the final region size is clamped:

`fragmentDensityTexelSize_{width} = clamp(fragmentDensityTexelSize_{width}, minFragmentDensityTexelSize_{width}, maxFragmentDensityTexelSize_{width})`

`fragmentDensityTexelSize_{height} = clamp(fragmentDensityTexelSize_{height}, minFragmentDensityTexelSize_{height}, maxFragmentDensityTexelSize_{height})`

When multiview is enabled for the render pass and the fragment density map attachment view was created with `layerCount` greater than 1, the density map layer that the texel is fetched from is:

`layer = baseArrayLayer + ViewIndex`

Otherwise:

*layer = baseArrayLayer*

The texel fetched from the density map at (i,j,layer) is next converted to density with the following operations.

### 16.2.1. Component Swizzle

The `components` member of [VkImageViewCreateInfo](#) is applied to the fetched texel as defined in [Image component swizzle](#).

### 16.2.2. Component Mapping

The swizzled texel's components are mapped to a density value:

$$densityValue_{xy} = (C'r, C'g)$$

## 16.3. Fragment Area Conversion

Fragment area for the framebuffer region is undefined if the density fetched is not a normalized floating-point value greater than `0.0`. Otherwise, the fetched fragment area for that region is derived as:

$$fragmentArea_{wh} = \frac{1.0}{densityValue_{xy}}$$

### 16.3.1. Fragment Area Filter

Optionally, the implementation **may** fetch additional density map texels in an implementation defined window around (i,j). The texels follow the standard conversion steps up to and including [fragment area conversion](#).

A single fetched fragment area for the framebuffer region is chosen by the implementation and **must** have an area between the *min* and *max* areas of the fetched set.

### 16.3.2. Fragment Area Clamp

The implementation **may** clamp the fetched fragment area to one that it supports. The clamped fragment area **must** have a size less than or equal to the original fetched value. Implementations **may** vary the supported set of fragment areas per framebuffer region. Fragment area (1,1) **must** always be in the supported set.

#### Note

For example, if the fetched fragment area is (1,4) but the implementation only supports areas of {(1,1),(2,2)}, it could choose to clamp the area to (2,2) since it has the same size as (1,4). While this would produce fragments that have lower quality strictly in the x-axis, the overall density is maintained.

The clamped fragment area is assigned to the corresponding framebuffer region.

# Chapter 17. Queries

*Queries* provide a mechanism to return information about the processing of a sequence of Vulkan commands. Query operations are asynchronous, and as such, their results are not returned immediately. Instead, their results, and their availability status are stored in a [Query Pool](#). The state of these queries **can** be read back on the host, or copied to a buffer object on the device.

The supported query types are [Occlusion Queries](#), [Pipeline Statistics Queries](#), and [Timestamp Queries](#). Intel performance queries are also supported if the associated extension is available.

## 17.1. Query Pools

Queries are managed using *query pool* objects. Each query pool is a collection of a specific number of queries of a particular type.

Query pools are represented by `VkQueryPool` handles:

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkQueryPool)
```

To create a query pool, call:

```
VkResult vkCreateQueryPool(  
    VkDevice device,  
    const VkQueryPoolCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkQueryPool* pQueryPool);
```

- `device` is the logical device that creates the query pool.
- `pCreateInfo` is a pointer to a `VkQueryPoolCreateInfo` structure containing the number and type of queries to be managed by the pool.
- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.
- `pQueryPool` is a pointer to a `VkQueryPool` handle in which the resulting query pool object is returned.

### Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pCreateInfo` **must** be a valid pointer to a valid `VkQueryPoolCreateInfo` structure
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- `pQueryPool` **must** be a valid pointer to a `VkQueryPool` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkQueryPoolCreateInfo` structure is defined as:

```
typedef struct VkQueryPoolCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkQueryPoolCreateFlags    flags;
    VkQueryType               queryType;
    uint32_t                  queryCount;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkQueryPoolCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is reserved for future use.
- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
- `queryCount` is the number of queries managed by the pool.
- `pipelineStatistics` is a bitmask of `VkQueryPipelineStatisticFlagBits` specifying which counters will be returned in queries on the new pool, as described below in [Pipeline Statistics Queries](#).

`pipelineStatistics` is ignored if `queryType` is not `VK_QUERY_TYPE_PIPELINE_STATISTICS`.

## Valid Usage

- If the `pipeline statistics queries` feature is not enabled, `queryType` **must** not be `VK_QUERY_TYPE_PIPELINE_STATISTICS`
- If `queryType` is `VK_QUERY_TYPE_PIPELINE_STATISTICS`, `pipelineStatistics` **must** be a valid combination of `VkQueryPipelineStatisticFlagBits` values
- If `queryType` is `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `pNext` chain **must** contain a structure of type `VkQueryPoolPerformanceCreateInfoKHR`
- `queryCount` **must** be greater than 0

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO`
- `pNext` **must** be `NULL` or a pointer to a valid instance of `VkQueryPoolPerformanceCreateInfoKHR`
- `flags` **must** be `0`
- `queryType` **must** be a valid `VkQueryType` value

```
typedef VkFlags VkQueryPoolCreateFlags;
```

`VkQueryPoolCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkQueryPoolPerformanceCreateInfoKHR` structure is defined as:

```
typedef struct VkQueryPoolPerformanceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t queueFamilyIndex;
    uint32_t counterIndexCount;
    const uint32_t* pCounterIndices;
} VkQueryPoolPerformanceCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `queueFamilyIndex` is the queue family index to create this performance query pool for.
- `counterIndexCount` is size of the `pCounterIndices` array.
- `pCounterIndices` is the array of indices into the `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR::pCounters` to enable in this performance query pool.

## Valid Usage

- `queueFamilyIndex` **must** be a valid queue family index of the device.
- The `performanceCounterQueryPools` feature **must** be enabled
- Each element of `pCounterIndices` **must** be in the range of counters reported by `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR` for the queue family specified in `queueFamilyIndex`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR`
- `pCounterIndices` **must** be a valid pointer to an array of `counterIndexCount uint32_t` values
- `counterIndexCount` **must** be greater than `0`

To query the number of passes required to query a performance query pool on a physical device, call:

```
void vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR(  
    VkPhysicalDevice           physicalDevice,  
    const VkQueryPoolPerformanceCreateInfoKHR* pPerformanceQueryCreateInfo,  
    uint32_t*                  pNumPasses);
```

- `physicalDevice` is the handle to the physical device whose queue family performance query counter properties will be queried
- `pPerformanceQueryCreateInfo` is a pointer to an `VkQueryPoolPerformanceCreateInfoKHR` of the performance query that is to be created
- `pNumPasses` is a pointer to an integer related to the number of passes required to query the performance query pool, as described below

The `pPerformanceQueryCreateInfo` member `VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex` **must** be a queue family of `physicalDevice`. The number of passes required to capture the counters specified in the `pPerformanceQueryCreateInfo` member `VkQueryPoolPerformanceCreateInfoKHR::pCounters` is returned in `pNumPasses`.

## Valid Usage (Implicit)

- `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- `pPerformanceQueryCreateInfo` **must** be a valid pointer to a `VkQueryPoolPerformanceCreateInfoKHR` structure
- `pNumPasses` **must** be a valid pointer to a `uint32_t` value

To destroy a query pool, call:

```
void vkDestroyQueryPool(  
    VkDevice           device,  
    VkQueryPool        queryPool,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the query pool.
- `queryPool` is the query pool to destroy.

- `pAllocator` controls host memory allocation as described in the [Memory Allocation](#) chapter.

## Valid Usage

- All submitted commands that refer to `queryPool` **must** have completed execution
- If `VkAllocationCallbacks` were provided when `queryPool` was created, a compatible set of callbacks **must** be provided here
- If no `VkAllocationCallbacks` were provided when `queryPool` was created, `pAllocator` **must** be `NULL`

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- If `queryPool` is not `VK_NULL_HANDLE`, `queryPool` **must** be a valid `VkQueryPool` handle
- If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- If `queryPool` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

## Host Synchronization

- Host access to `queryPool` **must** be externally synchronized

Possible values of `VkQueryPoolCreateInfo::queryType`, specifying the type of queries managed by the pool, are:

```
typedef enum VkQueryType {
    VK_QUERY_TYPE_OCCLUSION = 0,
    VK_QUERY_TYPE_PIPELINE_STATISTICS = 1,
    VK_QUERY_TYPE_TIMESTAMP = 2,
    VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT = 1000028004,
    VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR = 1000116000,
    VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV = 1000165000,
    VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL = 1000210000,
    VK_QUERY_TYPE_MAX_ENUM = 0x7FFFFFFF
} VkQueryType;
```

- `VK_QUERY_TYPE_OCCLUSION` specifies an [occlusion query](#).
- `VK_QUERY_TYPE_PIPELINE_STATISTICS` specifies a [pipeline statistics query](#).
- `VK_QUERY_TYPE_TIMESTAMP` specifies a [timestamp query](#).
- `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` specifies a [performance query](#).

- `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` specifies a transform feedback query.
- `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV` specifies a ray tracing acceleration structure size query.
- `VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL` specifies a Intel performance query.

## 17.2. Query Operation

The operation of queries is controlled by the commands `vkCmdBeginQuery`, `vkCmdEndQuery`, `vkCmdBeginQueryIndexedEXT`, `vkCmdEndQueryIndexedEXT`, `vkCmdResetQueryPool`, `vkCmdCopyQueryPoolResults`, and `vkCmdWriteTimestamp`.

In order for a `VkCommandBuffer` to record query management commands, the queue family for which its `VkCommandPool` was created **must** support the appropriate type of operations (graphics, compute) suitable for the query type of a given query pool.

Each query in a query pool has a status that is either *unavailable* or *available*, and also has state to store the numerical results of a query operation of the type requested when the query pool was created. Resetting a query via `vkCmdResetQueryPool` or `vkResetQueryPoolEXT` sets the status to unavailable and makes the numerical results undefined. Performing a query operation with `vkCmdBeginQuery` and `vkCmdEndQuery` changes the status to available when the query *finishes*, and updates the numerical results. Both the availability status and numerical results are retrieved by calling either `vkGetQueryPoolResults` or `vkCmdCopyQueryPoolResults`.

Query commands, for the same query and submitted to the same queue, execute in their entirety in **submission order**, relative to each other. In effect there is an implicit execution dependency from each such query command to all query command previously submitted to the same queue. There is one significant exception to this; if the `flags` parameter of `vkCmdCopyQueryPoolResults` does not include `VK_QUERY_RESULT_WAIT_BIT`, execution of `vkCmdCopyQueryPoolResults` **may** happen-before the results of `vkCmdEndQuery` are available.

After query pool creation, each query **must** be reset before it is used. Queries **must** also be reset between uses.

If a logical device includes multiple physical devices, then each command that writes a query **must** execute on a single physical device, and any call to `vkCmdBeginQuery` **must** execute the corresponding `vkCmdEndQuery` command on the same physical device.

To reset a range of queries in a query pool on a queue, call:

```
void vkCmdResetQueryPool(
    VkCommandBuffer
    VkQueryPool
    uint32_t
    uint32_t
                                commandBuffer,
                                queryPool,
                                firstQuery,
                                queryCount);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the handle of the query pool managing the queries being reset.

- `firstQuery` is the initial query index to reset.
- `queryCount` is the number of queries to reset.

When executed on a queue, this command sets the status of query indices [`firstQuery`, `firstQuery + queryCount - 1`] to unavailable.

## Valid Usage

- `firstQuery` **must** be less than the number of queries in `queryPool`
- The sum of `firstQuery` and `queryCount` **must** be less than or equal to the number of queries in `queryPool`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `queryPool` **must** be a valid `VkQueryPool` handle
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- This command **must** only be called outside of a render pass instance
- Both of `commandBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Outside	Graphics Compute	

To reset a range of queries in a query pool on the host, call:

```
void vkResetQueryPoolEXT(
    VkDevice device,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount);
```

- `device` is the logical device that owns the query pool.
- `queryPool` is the handle of the query pool managing the queries being reset.
- `firstQuery` is the initial query index to reset.
- `queryCount` is the number of queries to reset.

This command sets the status of query indices [`firstQuery`, `firstQuery + queryCount - 1`] to unavailable.

## Valid Usage

- The `hostQueryReset` feature **must** be enabled
- `firstQuery` **must** be less than the number of queries in `queryPool`
- The sum of `firstQuery` and `queryCount` **must** be less than or equal to the number of queries in `queryPool`
- Submitted commands that refer to the range specified by `firstQuery` and `queryCount` in `queryPool` **must** have completed execution
- The range of queries specified by `firstQuery` and `queryCount` in `queryPool` **must** not be in use by calls to `vkGetQueryPoolResults` or `vkResetQueryPoolEXT` in other threads

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `queryPool` **must** be a valid `VkQueryPool` handle
- `queryPool` **must** have been created, allocated, or retrieved from `device`

Once queries are reset and ready for use, query commands **can** be issued to a command buffer. Occlusion queries and pipeline statistics queries count events - drawn samples and pipeline stage invocations, respectively - resulting from commands that are recorded between a `vkCmdBeginQuery` command and a `vkCmdEndQuery` command within a specified command buffer, effectively scoping a set of drawing and/or dispatch commands. Timestamp queries write timestamps to a query pool. Performance queries record performance counters to a query pool.

A query **must** begin and end in the same command buffer, although if it is a primary command buffer, and the `inherited queries` feature is enabled, it **can** execute secondary command buffers during the query operation. For a secondary command buffer to be executed while a query is active, it **must** set the `occlusionQueryEnable`, `queryFlags`, and/or `pipelineStatistics` members of

[VkCommandBufferInheritanceInfo](#) to conservative values, as described in the [Command Buffer Recording](#) section. A query **must** either begin and end inside the same subpass of a render pass instance, or **must** both begin and end outside of a render pass instance (i.e. contain entire render pass instances).

If queries are used while executing a render pass instance that has multiview enabled, the query uses N consecutive query indices in the query pool (starting at [query](#)) where N is the number of bits set in the view mask in the subpass the query is used in. How the numerical results of the query are distributed among the queries is implementation-dependent. For example, some implementations **may** write each view's results to a distinct query, while other implementations **may** write the total result to the first query and write zero to the other queries. However, the sum of the results in all the queries **must** accurately reflect the total result of the query summed over all views. Applications **can** sum the results from all the queries to compute the total result.

Queries used with multiview rendering **must** not span subpasses, i.e. they **must** begin and end in the same subpass.

To begin a query, call:

```
void vkCmdBeginQuery(  
    VkCommandBuffer           commandBuffer,  
    VkQueryPool               queryPool,  
    uint32_t                  query,  
    VkQueryControlFlags       flags);
```

- [commandBuffer](#) is the command buffer into which this command will be recorded.
- [queryPool](#) is the query pool that will manage the results of the query.
- [query](#) is the query index within the query pool that will contain the results.
- [flags](#) is a bitmask of [VkQueryControlFlagBits](#) specifying constraints on the types of queries that **can** be performed.

If the [queryType](#) of the pool is [VK\\_QUERY\\_TYPE\\_OCCLUSION](#) and [flags](#) contains [VK\\_QUERY\\_CONTROL\\_PRECISE\\_BIT](#), an implementation **must** return a result that matches the actual number of samples passed. This is described in more detail in [Occlusion Queries](#).

Calling [vkCmdBeginQuery](#) is equivalent to calling [vkCmdBeginQueryIndexedEXT](#) with the [index](#) parameter set to zero.

After beginning a query, that query is considered *active* within the command buffer it was called in until that same query is ended. Queries active in a primary command buffer when secondary command buffers are executed are considered active for those secondary command buffers.

## Valid Usage

- `queryPool` **must** have been created with a `queryType` that differs from that of any queries that are `active` within `commandBuffer`
- All queries used by the command **must** be unavailable
- The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_TIMESTAMP`
- If the `precise occlusion queries` feature is not enabled, or the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_OCCLUSION`, `flags` **must** not contain `VK_QUERY_CONTROL_PRECISE_BIT`
- `query` **must** be less than the number of queries in `queryPool`
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_OCCLUSION`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate graphics operations, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate compute operations, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- `commandBuffer` **must** not be a protected command buffer
- If called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in `queryPool`
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` then `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackQueries` **must** be supported
- If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `profiling lock` **must** have been held before `vkBeginCommandBuffer` was called on `commandBuffer`.
- If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_QUERY_SCOPE_COMMAND_BUFFER_KHR`, the query begin **must** be the first recorded command in `commandBuffer`.
- If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_QUERY_SCOPE_RENDER_PASS_KHR`, the begin command **must** not be recorded within a render pass instance.
- If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and another query pool with a `queryType` `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` has been used within `commandBuffer`, its parent primary command buffer or secondary command buffer recorded within the same parent primary command buffer as `commandBuffer`, the `performanceCounterMultipleQueryPools` feature **must** be enabled.

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `queryPool` **must** be a valid `VkQueryPool` handle
- `flags` **must** be a valid combination of `VkQueryControlFlagBits` values
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- Both of `commandBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Graphics Compute	

To begin an indexed query, call:

```
void vkCmdBeginQueryIndexedEXT(  
    VkCommandBuffer  
    VkQueryPool  
    uint32_t  
    VkQueryControlFlags  
    uint32_t  
        commandBuffer,  
        queryPool,  
        query,  
        flags,  
        index);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that will manage the results of the query.
- `query` is the query index within the query pool that will contain the results.
- `flags` is a bitmask of `VkQueryControlFlagBits` specifying constraints on the types of queries that can be performed.
- `index` is the query type specific index. When the query type is `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the index represents the vertex stream.

The `vkCmdBeginQueryIndexedEXT` command operates the same as the `vkCmdBeginQuery` command, except that it also accepts a query type specific `index` parameter.

## Valid Usage

- `queryPool` **must** have been created with a `queryType` that differs from that of any queries that are `active` within `commandBuffer`
- All queries used by the command **must** be unavailable
- The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_TIMESTAMP`
- If the `precise occlusion queries` feature is not enabled, or the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_OCCLUSION`, `flags` **must** not contain `VK_QUERY_CONTROL_PRECISE_BIT`
- `query` **must** be less than the number of queries in `queryPool`
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_OCCLUSION`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate graphics operations, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate compute operations, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- `commandBuffer` **must** not be a protected command buffer
- If called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in `queryPool`
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the `index` parameter **must** be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the `index` **must** be zero
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` then `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackQueries` **must** be supported
- If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `profiling lock` **must** have been held before `vkBeginCommandBuffer` was called on `commandBuffer`.
- If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_QUERY_SCOPE_COMMAND_BUFFER_KHR`, the query begin **must** be the first recorded command in `commandBuffer`.
- If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_QUERY_SCOPE_RENDER_PASS_KHR`, the begin

command **must** not be recorded within a render pass instance.

- If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and another query pool with a `queryType` `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` has been used within `commandBuffer`, its parent primary command buffer or secondary command buffer recorded within the same parent primary command buffer as `commandBuffer`, the `performanceCounterMultipleQueryPools` feature **must** be enabled.

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `queryPool` **must** be a valid `VkQueryPool` handle
- `flags` **must** be a valid combination of `VkQueryControlFlagBits` values
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- Both of `commandBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Graphics Compute	

Bits which **can** be set in `vkCmdBeginQuery::flags`, specifying constraints on the types of queries that **can** be performed, are:

```
typedef enum VkQueryControlFlagBits {
    VK_QUERY_CONTROL_PRECISE_BIT = 0x00000001,
    VK_QUERY_CONTROL_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkQueryControlFlagBits;
```

- `VK_QUERY_CONTROL_PRECISE_BIT` specifies the precision of `occlusion` queries.

```
typedef VkFlags VkQueryControlFlags;
```

`VkQueryControlFlags` is a bitmask type for setting a mask of zero or more `VkQueryControlFlagBits`.

To end a query after the set of desired draw or dispatch commands is executed, call:

```
void vkCmdEndQuery(  
    VkCommandBuffer  
    VkQueryPool  
    uint32_t  
                                commandBuffer,  
                                queryPool,  
                                query);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that is managing the results of the query.
- `query` is the query index within the query pool where the result is stored.

Calling `vkCmdEndQuery` is equivalent to calling `vkCmdEndQueryIndexedEXT` with the `index` parameter set to zero.

As queries operate asynchronously, ending a query does not immediately set the query's status to available. A query is considered *finished* when the final results of the query are ready to be retrieved by `vkGetQueryPoolResults` and `vkCmdCopyQueryPoolResults`, and this is when the query's status is set to available.

Once a query is ended the query **must** finish in finite time, unless the state of the query is changed using other commands, e.g. by issuing a reset of the query.

## Valid Usage

- All queries used by the command **must** be `active`
- `query` **must** be less than the number of queries in `queryPool`
- `commandBuffer` **must** not be a protected command buffer
- If `vkCmdEndQuery` is called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in `queryPool`
- If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one or more of the counters used to create `queryPool` was `VK_QUERY_SCOPE_COMMAND_BUFFER_KHR`, the `vkCmdEndQuery` **must** be the last recorded command in `commandBuffer`.
- If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one or more of the counters used to create `queryPool` was `VK_QUERY_SCOPE_RENDER_PASS_KHR`, the `vkCmdEndQuery` **must** not be recorded within a render pass instance.

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `queryPool` **must** be a valid `VkQueryPool` handle
- `commandBuffer` **must** be in the `recording state`
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- Both of `commandBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Graphics Compute	

To end an indexed query after the set of desired draw or dispatch commands is recorded, call:

```
void vkCmdEndQueryIndexedEXT(  
    VkCommandBuffer  
    VkQueryPool  
    uint32_t  
    uint32_t  
                                commandBuffer,  
                                queryPool,  
                                query,  
                                index);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that is managing the results of the query.
- `query` is the query index within the query pool where the result is stored.
- `index` is the query type specific index.

The `vkCmdEndQueryIndexedEXT` command operates the same as the `vkCmdEndQuery` command, except that it also accepts a query type specific `index` parameter.

## Valid Usage

- All queries used by the command **must** be `active`
- `query` **must** be less than the number of queries in `queryPool`
- `commandBuffer` **must** not be a protected command buffer
- If `vkCmdEndQueryIndexedEXT` is called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in `queryPool`
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the `index` parameter **must** be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the `index` **must** be zero
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` `index` **must** equal the `index` used to begin the query

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `queryPool` **must** be a valid `VkQueryPool` handle
- `commandBuffer` **must** be in the `recording state`
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- Both of `commandBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Graphics Compute	

An application **can** retrieve results either by requesting they be written into application-provided memory, or by requesting they be copied into a [VkBuffer](#). In either case, the layout in memory is defined as follows:

- The first query's result is written starting at the first byte requested by the command, and each subsequent query's result begins [stride](#) bytes later.
- Occlusion queries, pipeline statistics queries, transform feedback queries, and timestamp queries store results in a tightly packed array of unsigned integers, either 32- or 64-bits as requested by the command, storing the numerical results and, if requested, the availability status.
- Performance queries store results in a tightly packed array whose type is determined by the [unit](#) member of the corresponding [VkPerformanceCounterKHR](#).
- If [VK\\_QUERY\\_RESULT\\_WITH\\_AVAILABILITY\\_BIT](#) is used, the final element of each query's result is an integer indicating whether the query's result is available, with any non-zero value indicating that it is available.
- Occlusion queries write one integer value - the number of samples passed. Pipeline statistics queries write one integer value for each bit that is enabled in the [pipelineStatistics](#) when the pool is created, and the statistics values are written in bit order starting from the least significant bit. Timestamp queries write one integer value. Performance queries write one [VkPerformanceCounterResultKHR](#) value for each [VkPerformanceCounterKHR](#) in the query. Transform feedback queries write two integers; the first integer is the number of primitives successfully written to the corresponding transform feedback buffer and the second is the number of primitives output to the vertex stream, regardless of whether they were successfully captured or not. In other words, if the transform feedback buffer was sized too small for the number of primitives output by the vertex stream, the first integer represents the number of primitives actually written and the second is the number that would have been written if all the transform feedback buffers associated with that vertex stream were large enough.
- If more than one query is retrieved and [stride](#) is not at least as large as the size of the array of values corresponding to a single query, the values written to memory are undefined.

To retrieve status and results for a set of queries, call:

```
VkResult vkGetQueryPoolResults(  
    VkDevice  
    VkQueryPool  
    uint32_t  
    uint32_t  
    size_t  
    void*  
    VkDeviceSize  
    VkQueryResultFlags  
        device,  
        queryPool,  
        firstQuery,  
        queryCount,  
        dataSize,  
        pData,  
        stride,  
        flags);
```

- [device](#) is the logical device that owns the query pool.
- [queryPool](#) is the query pool managing the queries containing the desired results.
- [firstQuery](#) is the initial query index.

- `queryCount` is the number of queries to read.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to a user-allocated buffer where the results will be written
- `stride` is the stride in bytes between results for individual queries within `pData`.
- `flags` is a bitmask of `VkQueryResultFlagBits` specifying how and when results are returned.

The range of queries read is defined by [`firstQuery`, `firstQuery` + `queryCount` - 1]. For pipeline statistics queries, each query index in the pool contains one integer value for each bit that is enabled in `VkQueryPoolCreateInfo::pname` `pipelineStatistics` when the pool is created.

If no bits are set in `flags`, and all requested queries are in the available state, results are written as an array of 32-bit unsigned integer values. The behavior when not all queries are available, is described [below](#).

If `VK_QUERY_RESULT_64_BIT` is not set and the result overflows a 32-bit value, the value **may** either wrap or saturate. Similarly, if `VK_QUERY_RESULT_64_BIT` is set and the result overflows a 64-bit value, the value **may** either wrap or saturate.

If `VK_QUERY_RESULT_WAIT_BIT` is set, Vulkan will wait for each query to be in the available state before retrieving the numerical results for that query. In this case, `vkGetQueryPoolResults` is guaranteed to succeed and return `VK_SUCCESS` if the queries become available in a finite time (i.e. if they have been issued and not reset). If queries will never finish (e.g. due to being reset but not issued), then `vkGetQueryPoolResults` **may** not return in finite time.

If `VK_QUERY_RESULT_WAIT_BIT` and `VK_QUERY_RESULT_PARTIAL_BIT` are both not set then no result values are written to `pData` for queries that are in the unavailable state at the time of the call, and `vkGetQueryPoolResults` returns `VK_NOT_READY`. However, availability state is still written to `pData` for those queries if `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is set.

#### Note

Applications **must** take care to ensure that use of the `VK_QUERY_RESULT_WAIT_BIT` bit has the desired effect.

For example, if a query has been used previously and a command buffer records the commands `vkCmdResetQueryPool`, `vkCmdBeginQuery`, and `vkCmdEndQuery` for that query, then the query will remain in the available state until `vkResetQueryPoolEXT` is called or the `vkCmdResetQueryPool` command executes on a queue. Applications **can** use fences or events to ensure that a query has already been reset before checking for its results or availability status. Otherwise, a stale value could be returned from a previous use of the query.

The above also applies when `VK_QUERY_RESULT_WAIT_BIT` is used in combination with `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`. In this case, the returned availability status **may** reflect the result of a previous use of the query unless `vkResetQueryPoolEXT` is called or the `vkCmdResetQueryPool` command has been executed since the last use of the query.

*Note*

Applications **can** double-buffer query pool usage, with a pool per frame, and reset queries at the end of the frame in which they are read.

If `VK_QUERY_RESULT_PARTIAL_BIT` is set, `VK_QUERY_RESULT_WAIT_BIT` is not set, and the query's status is unavailable, an intermediate result value between zero and the final result value is written to `pData` for that query.

If `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is set, the final integer value written for each query is non-zero if the query's status was available or zero if the status was unavailable. When `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is used, implementations **must** guarantee that if they return a non-zero availability value then the numerical results **must** be valid, assuming the results are not reset by a subsequent command.

*Note*

Satisfying this guarantee **may** require careful ordering by the application, e.g. to read the availability status before reading the results.

## Valid Usage

- `firstQuery` **must** be less than the number of queries in `queryPool`
- If `VK_QUERY_RESULT_64_BIT` is not set in `flags` and the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` then `pData` and `stride` **must** be multiples of 4
- If `VK_QUERY_RESULT_64_BIT` is set in `flags` then `pData` and `stride` **must** be multiples of 8
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then `pData` and `stride` **must** be multiples of the size of `VkPerformanceCounterResultKHR`
- The sum of `firstQuery` and `queryCount` **must** be less than or equal to the number of queries in `queryPool`
- `dataSize` **must** be large enough to contain the result of each query, as described [here](#)
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TIMESTAMP`, `flags` **must** not contain `VK_QUERY_RESULT_PARTIAL_BIT`
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, `flags` **must** not contain `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`, `VK_QUERY_RESULT_PARTIAL_BIT` or `VK_QUERY_RESULT_64_BIT`
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `queryPool` **must** have been recorded once for each pass as retrieved via a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `queryPool` **must** be a valid `VkQueryPool` handle
- `pData` **must** be a valid pointer to an array of `dataSize` bytes
- `flags` **must** be a valid combination of `VkQueryResultFlagBits` values
- `dataSize` **must** be greater than `0`
- `queryPool` **must** have been created, allocated, or retrieved from `device`

## Return Codes

### Success

- `VK_SUCCESS`
- `VK_NOT_READY`

### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

Bits which **can** be set in `vkGetQueryPoolResults::flags` and `vkCmdCopyQueryPoolResults::flags`, specifying how and when results are returned, are:

```
typedef enum VkQueryResultFlagBits {
    VK_QUERY_RESULT_64_BIT = 0x00000001,
    VK_QUERY_RESULT_WAIT_BIT = 0x00000002,
    VK_QUERY_RESULT_WITH_AVAILABILITY_BIT = 0x00000004,
    VK_QUERY_RESULT_PARTIAL_BIT = 0x00000008,
    VK_QUERY_RESULT_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkQueryResultFlagBits;
```

- `VK_QUERY_RESULT_64_BIT` specifies the results will be written as an array of 64-bit unsigned integer values. If this bit is not set, the results will be written as an array of 32-bit unsigned integer values.
- `VK_QUERY_RESULT_WAIT_BIT` specifies that Vulkan will wait for each query's status to become available before retrieving its results.
- `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` specifies that the availability status accompanies the results.
- `VK_QUERY_RESULT_PARTIAL_BIT` specifies that returning partial results is acceptable.

```
typedef VkFlags VkQueryResultFlags;
```

`VkQueryResultFlags` is a bitmask type for setting a mask of zero or more `VkQueryResultFlagBits`.

To copy query statuses and numerical results directly to buffer memory, call:

```
void vkCmdCopyQueryPoolResults(  
    VkCommandBuffer  
    commandBuffer,  
    VkQueryPool  
    queryPool,  
    uint32_t  
    firstQuery,  
    uint32_t  
    queryCount,  
    VkBuffer  
    dstBuffer,  
    VkDeviceSize  
    dstOffset,  
    VkDeviceSize  
    stride,  
    VkQueryResultFlags  
    flags);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool managing the queries containing the desired results.
- `firstQuery` is the initial query index.
- `queryCount` is the number of queries. `firstQuery` and `queryCount` together define a range of queries.
- `dstBuffer` is a `VkBuffer` object that will receive the results of the copy command.
- `dstOffset` is an offset into `dstBuffer`.
- `stride` is the stride in bytes between results for individual queries within `dstBuffer`. The required size of the backing memory for `dstBuffer` is determined as described above for `vkGetQueryPoolResults`.
- `flags` is a bitmask of `VkQueryResultFlagBits` specifying how and when results are returned.

`vkCmdCopyQueryPoolResults` is guaranteed to see the effect of previous uses of `vkCmdResetQueryPool` in the same queue, without any additional synchronization. Thus, the results will always reflect the most recent use of the query.

`flags` has the same possible values described above for the `flags` parameter of `vkGetQueryPoolResults`, but the different style of execution causes some subtle behavioral differences. Because `vkCmdCopyQueryPoolResults` executes in order with respect to other query commands, there is less ambiguity about which use of a query is being requested.

Results for all requested occlusion queries, pipeline statistics queries, transform feedback queries, and timestamp queries are written as 64-bit unsigned integer values if `VK_QUERY_RESULT_64_BIT` is set or 32-bit unsigned integer values otherwise. Performance queries store results in a tightly packed array whose type is determined by the `unit` member of the corresponding `VkPerformanceCounterKHR`.

If neither of `VK_QUERY_RESULT_WAIT_BIT` and `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` are set, results are only written out for queries in the available state.

If `VK_QUERY_RESULT_WAIT_BIT` is set, the implementation will wait for each query's status to be in the available state before retrieving the numerical results for that query. This is guaranteed to reflect

the most recent use of the query on the same queue, assuming that the query is not being simultaneously used by other queues. If the query does not become available in a finite amount of time (e.g. due to not issuing a query since the last reset), a `VK_ERROR_DEVICE_LOST` error **may** occur.

Similarly, if `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is set and `VK_QUERY_RESULT_WAIT_BIT` is not set, the availability is guaranteed to reflect the most recent use of the query on the same queue, assuming that the query is not being simultaneously used by other queues. As with `vkGetQueryPoolResults`, implementations **must** guarantee that if they return a non-zero availability value, then the numerical results are valid.

If `VK_QUERY_RESULT_PARTIAL_BIT` is set, `VK_QUERY_RESULT_WAIT_BIT` is not set, and the query's status is unavailable, an intermediate result value between zero and the final result value is written for that query.

`VK_QUERY_RESULT_PARTIAL_BIT` **must** not be used if the pool's `queryType` is `VK_QUERY_TYPE_TIMESTAMP`.

`vkCmdCopyQueryPoolResults` is considered to be a transfer operation, and its writes to buffer memory **must** be synchronized using `VK_PIPELINE_STAGE_TRANSFER_BIT` and `VK_ACCESS_TRANSFER_WRITE_BIT` before using the results.

## Valid Usage

- `dstOffset` **must** be less than the size of `dstBuffer`
- `firstQuery` **must** be less than the number of queries in `queryPool`
- The sum of `firstQuery` and `queryCount` **must** be less than or equal to the number of queries in `queryPool`
- If `VK_QUERY_RESULT_64_BIT` is not set in `flags` then `dstOffset` and `stride` **must** be multiples of 4
- If `VK_QUERY_RESULT_64_BIT` is set in `flags` then `dstOffset` and `stride` **must** be multiples of 8
- `dstBuffer` **must** have enough storage, from `dstOffset`, to contain the result of each query, as described [here](#)
- `dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag
- If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TIMESTAMP`, `flags` **must** not contain `VK_QUERY_RESULT_PARTIAL_BIT`
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, `VkPhysicalDevicePerformanceQueryPropertiesKHR::allowCommandBufferQueryCopies` **must** be `VK_TRUE`
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, `flags` **must** not contain `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`, `VK_QUERY_RESULT_PARTIAL_BIT` or `VK_QUERY_RESULT_64_BIT`
- If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `queryPool` **must** have been submitted once for each pass as retrieved via a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.
- `vkCmdCopyQueryPoolResults` **must** not be called if the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL`.

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `queryPool` **must** be a valid `VkQueryPool` handle
- `dstBuffer` **must** be a valid `VkBuffer` handle
- `flags` **must** be a valid combination of `VkQueryResultFlagBits` values
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- This command **must** only be called outside of a render pass instance
- Each of `commandBuffer`, `dstBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Outside	Graphics Compute	Transfer

Rendering operations such as clears, MSAA resolves, attachment load/store operations, and blits **may** count towards the results of queries. This behavior is implementation-dependent and **may** vary depending on the path used within an implementation. For example, some implementations have several types of clears, some of which **may** include vertices and some not.

## 17.3. Occlusion Queries

Occlusion queries track the number of samples that pass the per-fragment tests for a set of drawing commands. As such, occlusion queries are only available on queue families supporting graphics operations. The application **can** then use these results to inform future rendering decisions. An occlusion query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively. When an occlusion query begins, the count of passing samples always starts at zero. For each drawing command, the count is incremented as described in [Sample Counting](#). If `flags` does not contain `VK_QUERY_CONTROL_PRECISE_BIT` an implementation **may** generate any non-zero result value for the query if the count of passing samples is non-zero.

*Note*

Not setting `VK_QUERY_CONTROL_PRECISE_BIT` mode **may** be more efficient on some implementations, and **should** be used where it is sufficient to know a boolean result on whether any samples passed the per-fragment tests. In this case, some implementations **may** only return zero or one, indifferent to the actual number of samples passing the per-fragment tests.

When an occlusion query finishes, the result for that query is marked as available. The application **can** then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

*Note*

If occluding geometry is not drawn first, samples **can** pass the depth test, but still not be visible in a final image.

## 17.4. Pipeline Statistics Queries

Pipeline statistics queries allow the application to sample a specified set of `VkPipeline` counters. These counters are accumulated by Vulkan for a set of either draw or dispatch commands while a pipeline statistics query is active. As such, pipeline statistics queries are available on queue families supporting either graphics or compute operations. The availability of pipeline statistics queries is indicated by the `pipelineStatisticsQuery` member of the `VkPhysicalDeviceFeatures` object (see `vkGetPhysicalDeviceFeatures` and `vkCreateDevice` for detecting and requesting this query type on a `VkDevice`).

A pipeline statistics query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively. When a pipeline statistics query begins, all statistics counters are set to zero. While the query is active, the pipeline type determines which set of statistics are available, but these **must** be configured on the query pool when it is created. If a statistic counter is issued on a command buffer that does not support the corresponding operation, the value of that counter is undefined after the query has finished. At least one statistic counter relevant to the operations supported on the recording command buffer **must** be enabled.

Bits which **can** be set to individually enable pipeline statistics counters for query pools with `VkQueryPoolCreateInfo::pipelineStatistics`, and for secondary command buffers with `VkCommandBufferInheritanceInfo::pipelineStatistics`, are:

```

typedef enum VkQueryPipelineStatisticFlagBits {
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT = 0x00000001,
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT = 0x00000002,
    VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT = 0x00000004,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT = 0x00000008,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT = 0x00000010,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT = 0x00000020,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT = 0x00000040,
    VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT = 0x00000080,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT = 0x00000100,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT =
        0x00000200,
    VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT = 0x00000400,
    VK_QUERY_PIPELINE_STATISTIC_FLAG_BITS_MAX_ENUM = 0x7FFFFFFF
} VkQueryPipelineStatisticFlagBits;

```

- **VK\_QUERY\_PIPELINE\_STATISTIC\_INPUT\_ASSEMBLY\_VERTICES\_BIT** specifies that queries managed by the pool will count the number of vertices processed by the [input assembly](#) stage. Vertices corresponding to incomplete primitives **may** contribute to the count.
- **VK\_QUERY\_PIPELINE\_STATISTIC\_INPUT\_ASSEMBLY\_PRIMITIVES\_BIT** specifies that queries managed by the pool will count the number of primitives processed by the [input assembly](#) stage. If primitive restart is enabled, restarting the primitive topology has no effect on the count. Incomplete primitives **may** be counted.
- **VK\_QUERY\_PIPELINE\_STATISTIC\_VERTEX\_SHADER\_INVOCATIONS\_BIT** specifies that queries managed by the pool will count the number of vertex shader invocations. This counter's value is incremented each time a vertex shader is [invoked](#).
- **VK\_QUERY\_PIPELINE\_STATISTIC\_GEOMETRY\_SHADER\_INVOCATIONS\_BIT** specifies that queries managed by the pool will count the number of geometry shader invocations. This counter's value is incremented each time a geometry shader is [invoked](#). In the case of [instanced geometry shaders](#), the geometry shader invocations count is incremented for each separate instanced invocation.
- **VK\_QUERY\_PIPELINE\_STATISTIC\_GEOMETRY\_SHADER\_PRIMITIVES\_BIT** specifies that queries managed by the pool will count the number of primitives generated by geometry shader invocations. The counter's value is incremented each time the geometry shader emits a primitive. Restarting primitive topology using the SPIR-V instructions [OpEndPrimitive](#) or [OpEndStreamPrimitive](#) has no effect on the geometry shader output primitives count.
- **VK\_QUERY\_PIPELINE\_STATISTIC\_CLIPPING\_INVOCATIONS\_BIT** specifies that queries managed by the pool will count the number of primitives processed by the [Primitive Clipping](#) stage of the pipeline. The counter's value is incremented each time a primitive reaches the primitive clipping stage.
- **VK\_QUERY\_PIPELINE\_STATISTIC\_CLIPPING\_PRIMITIVES\_BIT** specifies that queries managed by the pool will count the number of primitives output by the [Primitive Clipping](#) stage of the pipeline. The counter's value is incremented each time a primitive passes the primitive clipping stage. The actual number of primitives output by the primitive clipping stage for a particular input primitive is implementation-dependent but **must** satisfy the following conditions:

- If at least one vertex of the input primitive lies inside the clipping volume, the counter is incremented by one or more.
- Otherwise, the counter is incremented by zero or more.
- `VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT` specifies that queries managed by the pool will count the number of fragment shader invocations. The counter’s value is incremented each time the fragment shader is [invoked](#).
- `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT` specifies that queries managed by the pool will count the number of patches processed by the tessellation control shader. The counter’s value is incremented once for each patch for which a tessellation control shader is [invoked](#).
- `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT` specifies that queries managed by the pool will count the number of invocations of the tessellation evaluation shader. The counter’s value is incremented each time the tessellation evaluation shader is [invoked](#).
- `VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT` specifies that queries managed by the pool will count the number of compute shader invocations. The counter’s value is incremented every time the compute shader is invoked. Implementations **may** skip the execution of certain compute shader invocations or execute additional compute shader invocations for implementation-dependent reasons as long as the results of rendering otherwise remain unchanged.

These values are intended to measure relative statistics on one implementation. Various device architectures will count these values differently. Any or all counters **may** be affected by the issues described in [Query Operation](#).

#### Note

For example, tile-based rendering devices **may** need to replay the scene multiple times, affecting some of the counts.

If a pipeline has `rasterizerDiscardEnable` enabled, implementations **may** discard primitives after the final vertex processing stage. As a result, if `rasterizerDiscardEnable` is enabled, the clipping input and output primitives counters **may** not be incremented.

When a pipeline statistics query finishes, the result for that query is marked as available. The application **can** copy the result to a buffer (via `vkCmdCopyQueryPoolResults`), or request it be put into host memory (via `vkGetQueryPoolResults`).

```
typedef VkFlags VkQueryPipelineStatisticFlags;
```

`VkQueryPipelineStatisticFlags` is a bitmask type for setting a mask of zero or more `VkQueryPipelineStatisticFlagBits`.

## 17.5. Timestamp Queries

*Timestamps* provide applications with a mechanism for timing the execution of commands. A

timestamp is an integer value generated by the `VkPhysicalDevice`. Unlike other queries, timestamps do not operate over a range, and so do not use `vkCmdBeginQuery` or `vkCmdEndQuery`. The mechanism is built around a set of commands that allow the application to tell the `VkPhysicalDevice` to write timestamp values to a `query pool` and then either read timestamp values on the host (using `vkGetQueryPoolResults`) or copy timestamp values to a `VkBuffer` (using `vkCmdCopyQueryPoolResults`). The application **can** then compute differences between timestamps to determine execution time.

The number of valid bits in a timestamp value is determined by the `VkQueueFamilyProperties::timestampValidBits` property of the queue on which the timestamp is written. Timestamps are supported on any queue which reports a non-zero value for `timestampValidBits` via `vkGetPhysicalDeviceQueueFamilyProperties`. If the `timestampComputeAndGraphics` limit is `VK_TRUE`, timestamps are supported by every queue family that supports either graphics or compute operations (see `VkQueueFamilyProperties`).

The number of nanoseconds it takes for a timestamp value to be incremented by 1 **can** be obtained from `VkPhysicalDeviceLimits::timestampPeriod` after a call to `vkGetPhysicalDeviceProperties`.

To request a timestamp, call:

```
void vkCmdWriteTimestamp(  
    VkCommandBuffer  
    VkPipelineStageFlagBits  
    VkQueryPool  
    uint32_t  
        commandBuffer,  
        pipelineStage,  
        queryPool,  
        query);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineStage` is one of the `VkPipelineStageFlagBits`, specifying a stage of the pipeline.
- `queryPool` is the query pool that will manage the timestamp.
- `query` is the query within the query pool that will contain the timestamp.

`vkCmdWriteTimestamp` latches the value of the timer when all previous commands have completed executing as far as the specified pipeline stage, and writes the timestamp value to memory. When the timestamp value is written, the availability status of the query is set to available.

*Note*

If an implementation is unable to detect completion and latch the timer at any specific stage of the pipeline, it **may** instead do so at any logically later stage.

`vkCmdCopyQueryPoolResults` **can** then be called to copy the timestamp value from the query pool into buffer memory, with ordering and synchronization behavior equivalent to how other queries operate. Timestamp values **can** also be retrieved from the query pool using `vkGetQueryPoolResults`. As with other queries, the query **must** be reset using `vkCmdResetQueryPool` or `vkResetQueryPoolEXT` before requesting the timestamp value be written to it.

While `vkCmdWriteTimestamp` **can** be called inside or outside of a render pass instance, `vkCmdCopyQueryPoolResults` **must** only be called outside of a render pass instance.

Timestamps **may** only be meaningfully compared if they are written by commands submitted to the same queue.

*Note*

An example of such a comparison is determining the execution time of a sequence of commands.

If `vkCmdWriteTimestamp` is called while executing a render pass instance that has multiview enabled, the timestamp uses N consecutive query indices in the query pool (starting at `query`) where N is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

- The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the difference between the first query written by each command.
- All N queries are timestamp values. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the sum of the difference between corresponding queries written by each command. The difference between corresponding queries **may** be the execution time of a single view.

In either case, the application **can** sum the differences between all N queries to determine the total execution time.

## Valid Usage

- `queryPool` **must** have been created with a `queryType` of `VK_QUERY_TYPE_TIMESTAMP`
- The query identified by `queryPool` and `query` **must** be *unavailable*
- The command pool's queue family **must** support a non-zero `timestampValidBits`
- All queries used by the command **must** be unavailable
- If `vkCmdWriteTimestamp` is called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in `queryPool`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `pipelineStage` **must** be a valid `VkPipelineStageFlagBits` value
- `queryPool` **must** be a valid `VkQueryPool` handle
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations
- Both of `commandBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Transfer Graphics Compute	Transfer

## 17.6. Performance Queries

*Performance queries* provide applications with a mechanism for getting performance counter information about the execution of command buffers, render passes, and commands.

Each queue family advertises the performance counters that **can** be queried on a queue of that family via a call to `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR`. Implementations **may** limit access to performance counters based on platform requirements or only to specialized drivers for development purposes.

### Note

This may include no performance counters being enumerated, or a reduced set. Please refer to platform-specific documentation for guidance on any such restrictions.

Performance queries use the existing `vkCmdBeginQuery` and `vkCmdEndQuery` to control what

command buffers, render passes, or commands to get performance information for.

Implementations **may** require multiple passes where the command buffer, render passes, or commands being recorded are the same and are executed on the same queue to record performance counter data. This is achieved by submitting the same batch and providing a [VkPerformanceQuerySubmitInfoKHR](#) structure containing a counter pass index. The number of passes required for a given performance query pool **can** be queried via a call to [vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR](#).

*Note*

Command buffers created with `enum:VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` **must** not be re-submitted. Changing command buffer usage bits **may** affect performance. To avoid this, the application **should** re-record any command buffers with the `enum:VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` when multiple counter passes are required.

Performance counter results from a performance query pool **can** be obtained with the command [vkGetQueryPoolResults](#).

Performance query results are returned in an array of [VkPerformanceCounterResultKHR](#) unions containing the data associated with each counter in the query, stored in the same order as the counters supplied in `pCounterIndices` when creating the performance query. The [VkPerformanceCounterKHR::unit](#) enumeration specifies how to parse the counter data.

```
typedef union VkPerformanceCounterResultKHR {
    int32_t    int32;
    int64_t    int64;
    uint32_t   uint32;
    uint64_t   uint64;
    float      float32;
    double     float64;
} VkPerformanceCounterResultKHR;
```

### 17.6.1. Profiling Lock

To record and submit a command buffer that contains a performance query pool the profiling lock **must** be held. The profiling lock **must** be acquired prior to any call to [vkBeginCommandBuffer](#) that will be using a performance query pool. The profiling lock **must** be held while any command buffer that contains a performance query pool is in the *recording*, *executable*, or *pending state*. To acquire the profiling lock, call:

```
VkResult vkAcquireProfilingLockKHR(
    VkDevice           device,
    const VkAcquireProfilingLockInfoKHR* pInfo);
```

- `device` is the logical device to profile.

- `pInfo` is a pointer to an instance of the `VkAcquireProfilingLockInfoKHR` structure which contains information about how the profiling is to be acquired.

Implementations **may** allow multiple actors to hold the profiling lock concurrently.

## Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pInfo` **must** be a valid pointer to a valid `VkAcquireProfilingLockInfoKHR` structure

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_TIMEOUT`

The `VkAcquireProfilingLockInfoKHR` structure is defined as:

```
typedef struct VkAcquireProfilingLockInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkAcquireProfilingLockFlagsKHR flags;
    uint64_t                  timeout;
} VkAcquireProfilingLockInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is reserved for future use.
- `timeout` indicates how long the function waits, in nanoseconds, if the profiling lock is not available.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR`
- `pNext` **must** be `NULL`
- `flags` **must** be `0`

If `timeout` is 0, `vkAcquireProfilingLockKHR` will not block while attempting to acquire the profiling lock. If `timeout` is `UINT64_MAX`, the function will not return until the profiling lock was acquired.

```
typedef enum VkAcquireProfilingLockFlagBitsKHR {
    VK_ACQUIRE_PROFILING_LOCK_FLAG_BITS_MAX_ENUM_KHR = 0x7FFFFFFF
} VkAcquireProfilingLockFlagBitsKHR;
```

```
typedef VkFlags VkAcquireProfilingLockFlagsKHR;
```

`VkAcquireProfilingLockFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To release the profiling lock, call:

```
void vkReleaseProfilingLockKHR(
    VkDevice                                     device);
```

- `device` is the logical device to cease profiling on.

### Valid Usage

- The profiling lock of `device` **must** have been held via a previous successful call to [vkAcquireProfilingLockKHR](#).

### Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle

## 17.7. Transform Feedback Queries

Transform feedback queries track the number of primitives attempted to be written and actually written, by the vertex stream being captured, to a transform feedback buffer. This query is updated during draw commands while transform feedback is active. The number of primitives actually written will be less than the number attempted to be written if the bound transform feedback buffer size was too small for the number of primitives actually drawn. Primitives are not written beyond the bound range of the transform feedback buffer. A transform feedback query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively to query for vertex stream zero. `vkCmdBeginQueryIndexedEXT` and `vkCmdEndQueryIndexedEXT` **can** be used to begin and end transform feedback queries for any supported vertex stream. When a transform feedback query begins, the count of primitives written and primitives needed starts from zero. For each drawing command, the count is incremented as vertex attribute outputs are captured to the transform feedback buffers while transform feedback is active.

When a transform feedback query finishes, the result for that query is marked as available. The application **can** then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

## 17.8. Intel performance queries

Intel performance queries allow an application to capture performance data for a set of commands. Performance queries are used in a similar way than other types of queries. A main difference with existing queries is that the resulting data should be handed over to a library capable of producing human readable results rather than being read directly by an application.

Prior to creating a performance query pool, initialize the device for performance queries with the call:

```
VkResult vkInitializePerformanceApiINTEL(  
    VkDevice                                     device,  
    const VkInitializePerformanceApiInfoINTEL* pInitializeInfo);
```

- `device` is the logical device used for the queries.
- `pInitializeInfo` is a pointer to a `VkInitializePerformanceApiInfoINTEL` structure specifying initialization parameters.

### Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `pInitializeInfo` **must** be a valid pointer to a valid `VkInitializePerformanceApiInfoINTEL` structure

### Return Codes

#### Success

- `VK_SUCCESS`

#### Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkInitializePerformanceApiInfoINTEL` structure is defined as :

```
typedef struct VkInitializePerformanceApiInfoINTEL {  
    VkStructureType    sType;  
    const void*        pNext;  
    void*              pUserData;  
} VkInitializePerformanceApiInfoINTEL;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.

- `pUserData` is a pointer for application data.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_INITIALIZE_PERFORMANCE_API_INFO_INTEL`
- `pNext` **must** be `NULL`

Once performance query operations have completed, uninitialized the device for performance queries with the call:

```
void vkUninitializePerformanceApiINTEL(  
    VkDevice                               device);
```

- `device` is the logical device used for the queries.

### Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle

Some performance query features of a device can be discovered with the call:

```
VkResult vkGetPerformanceParameterINTEL(  
    VkDevice                               device,  
    VkPerformanceParameterTypeINTEL      parameter,  
    VkPerformanceValueINTEL*            pValue);
```

- `device` is the logical device to query.
- `parameter` is the parameter to query.
- `pValue` is a pointer to a `VkPerformanceValueINTEL` structure in which the type and value of the parameter are returned.

### Valid Usage (Implicit)

- `device` **must** be a valid `VkDevice` handle
- `parameter` **must** be a valid `VkPerformanceParameterTypeINTEL` value
- `pValue` **must** be a valid pointer to a `VkPerformanceValueINTEL` structure

## Return Codes

### Success

- VK\_SUCCESS

### Failure

- VK\_ERROR\_TOO\_MANY\_OBJECTS
- VK\_ERROR\_OUT\_OF\_HOST\_MEMORY

Possible values of `vkGetPerformanceParameterINTEL::parameter`, specifying a performance query feature, are:

```
typedef enum VkPerformanceParameterTypeINTEL {
    VK_PERFORMANCE_PARAMETER_TYPE_HW_COUNTERS_SUPPORTED_INTEL = 0,
    VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL = 1,
    VK_PERFORMANCE_PARAMETER_TYPE_MAX_ENUM_INTEL = 0x7FFFFFFF
} VkPerformanceParameterTypeINTEL;
```

- `VK_PERFORMANCE_PARAMETER_TYPE_HW_COUNTERS_SUPPORTED_INTEL` has a boolean result which tells whether hardware counters can be captured.
- `VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL` has a 32 bits integer result which tells how many bits can be written into the `VkPerformanceValueINTEL` value.

The `VkPerformanceValueINTEL` structure is defined as:

```
typedef struct VkPerformanceValueINTEL {
    VkPerformanceValueTypeINTEL    type;
    VkPerformanceValueDataINTEL   data;
} VkPerformanceValueINTEL;
```

- `type` is a `VkPerformanceValueTypeINTEL` value specifying the type of the returned data.
- `data` is a `VkPerformanceValueDataINTEL` union specifying the value of the returned data.

## Valid Usage (Implicit)

- `type` **must** be a valid `VkPerformanceValueTypeINTEL` value
- `data` **must** be a valid `VkPerformanceValueDataINTEL` union

Possible values of `VkPerformanceValueINTEL::type`, specifying the type of the data returned in `VkPerformanceValueINTEL::data`, are:

- `VK_PERFORMANCE_VALUE_TYPE_UINT32_INTEL` specifies that unsigned 32-bit integer data is returned in `data.value32`.
- `VK_PERFORMANCE_VALUE_TYPE_UINT64_INTEL` specifies that unsigned 64-bit integer data is returned

in `data.value64`.

- `VK_PERFORMANCE_VALUE_TYPE_FLOAT_INTEL` specifies that floating-point data is returned in `data.valueFloat`.
- `VK_PERFORMANCE_VALUE_TYPE_BOOL_INTEL` specifies that `Bool32` data is returned in `data.valueBool`.
- `VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL` specifies that a pointer to a null-terminated UTF-8 string is returned in `data.valueString`. The pointer is valid for the lifetime of the `device` parameter passed to `vkGetPerformanceParameterINTEL`.

```
typedef enum VkPerformanceValueTypeINTEL {
    VK_PERFORMANCE_VALUE_TYPE_UINT32_INTEL = 0,
    VK_PERFORMANCE_VALUE_TYPE_UINT64_INTEL = 1,
    VK_PERFORMANCE_VALUE_TYPE_FLOAT_INTEL = 2,
    VK_PERFORMANCE_VALUE_TYPE_BOOL_INTEL = 3,
    VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL = 4,
    VK_PERFORMANCE_VALUE_TYPE_MAX_ENUM_INTEL = 0x7FFFFFFF
} VkPerformanceValueTypeINTEL;
```

The `VkPerformanceValueDataINTEL` union is defined as:

```
typedef union VkPerformanceValueDataINTEL {
    uint32_t      value32;
    uint64_t      value64;
    float         valueFloat;
    VkBool32      valueBool;
    const char*   valueString;
} VkPerformanceValueDataINTEL;
```

- `data.value32` represents 32-bit integer data.
- `data.value64` represents 64-bit integer data.
- `data.valueFloat` represents floating-point data.
- `data.valueBool` represents `Bool32` data.
- `data.valueString` represents a pointer to a null-terminated UTF-8 string.

The correct member of the union is determined by the associated `VkPerformanceValueTypeINTEL` value.

### Valid Usage (Implicit)

- `valueString` must be a valid pointer to a valid

The `VkQueryPoolCreateInfoINTEL` structure is defined as:

```

typedef struct VkQueryPoolCreateInfoINTEL {
    VkStructureType           sType;
    const void*              pNext;
    VkQueryPoolSamplingModeINTEL performanceCountersSampling;
} VkQueryPoolCreateInfoINTEL;

```

To create a pool for Intel performance queries, set `VkQueryPoolCreateInfo::queryType` to `VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL` and add a `VkQueryPoolCreateInfoINTEL` to the `pNext` chain of the `VkQueryPoolCreateInfo` structure.

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `performanceCountersSampling` describe how performance queries should be captured.

### Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO_INTEL`
- `pNext` **must** be `NULL`
- `performanceCountersSampling` **must** be a valid `VkQueryPoolSamplingModeINTEL` value

Possible values of `VkQueryPoolCreateInfoINTEL::performanceCountersSampling` are:

```

typedef enum VkQueryPoolSamplingModeINTEL {
    VK_QUERY_POOL_SAMPLING_MODE_MANUAL_INTEL = 0,
    VK_QUERY_POOL_SAMPLING_MODE_MAX_ENUM_INTEL = 0x7FFFFFFF
} VkQueryPoolSamplingModeINTEL;

```

- `VK_QUERY_POOL_SAMPLING_MODE_MANUAL_INTEL` is the default mode in which the application calls `vkCmdBeginQuery` and `vkCmdEndQuery` to record performance data.

To help associate query results with a particular point at which an application emitted commands, markers can be set into the command buffers with the call:

```

VkResult vkCmdSetPerformanceMarkerINTEL(
    VkCommandBuffer                      commandBuffer,
    const VkPerformanceMarkerInfoINTEL* pMarkerInfo);

```

The last marker set onto a command buffer before the end of a query will be part of the query result.

## Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle
- `pMarkerInfo` must be a valid pointer to a valid `VkPerformanceMarkerInfoINTEL` structure
- `commandBuffer` must be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, or transfer operations

## Host Synchronization

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Graphics Compute Transfer	

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkPerformanceMarkerInfoINTEL` structure is defined as:

```
typedef struct VkPerformanceMarkerInfoINTEL {
    VkStructureType    sType;
    const void*        pNext;
    uint64_t           marker;
} VkPerformanceMarkerInfoINTEL;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `marker` is the marker value that will be recorded into the opaque query results.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_MARKER_INFO_INTEL`
- `pNext` **must** be `NULL`

When monitoring the behavior of an application within the dataset generated by the entire set of applications running on the system, it is useful to identify draw calls within a potentially huge amount of performance data. To do so, application can generate stream markers that will be used to trace back a particular draw call with a particular performance data item.

```
VkResult vkCmdSetPerformanceStreamMarkerINTEL(  
    VkCommandBuffer                           commandBuffer,  
    const VkPerformanceStreamMarkerInfoINTEL* pMarkerInfo);
```

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `pMarkerInfo` **must** be a valid pointer to a valid `VkPerformanceStreamMarkerInfoINTEL` structure
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, compute, or transfer operations

## Host Synchronization

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Graphics Compute Transfer	

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkPerformanceStreamMarkerInfoINTEL` structure is defined as:

```
typedef struct VkPerformanceStreamMarkerInfoINTEL {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           marker;
} VkPerformanceStreamMarkerInfoINTEL;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `marker` is the marker value that will be recorded into the reports consumed by an external application.

## Valid Usage

- The value written by the application into `marker` **must** only used the valid bits as reported by `vkGetPerformanceParameterINTEL` with the `VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL`.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_STREAM_MARKER_INFO_INTEL`
- `pNext` **must** be `NULL`

Some applications might want measure the effect of a set of commands with a different settings. It is possible to override a particular settings using :

```
VkResult vkCmdSetPerformanceOverrideINTEL(
    VkCommandBuffer          commandBuffer,
    const VkPerformanceOverrideInfoINTEL* pOverrideInfo);
```

- `commandBuffer` is the command buffer where the override takes place.
- `pOverrideInfo` is a pointer to a `VkPerformanceOverrideInfoINTEL` structure selecting the

parameter to override.

## Valid Usage

- `pOverrideInfo` **must** not be used with a `VkPerformanceOverrideTypeINTEL` that is not reported available by `vkGetPerformanceParameterINTEL`.

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `pOverrideInfo` **must** be a valid pointer to a valid `VkPerformanceOverrideInfoINTEL` structure
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, compute, or transfer operations

## Host Synchronization

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Graphics Compute Transfer	

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkPerformanceOverrideInfoINTEL` structure is defined as:

```

typedef struct VkPerformanceOverrideInfoINTEL {
    VkStructureType          sType;
    const void*             pNext;
    VkPerformanceOverrideTypeINTEL type;
    VkBool32                 enable;
    uint64_t                  parameter;
} VkPerformanceOverrideInfoINTEL;

```

- **type** is the particular `VkPerformanceOverrideTypeINTEL` to set.
- **enable** defines whether the override is enabled.
- **parameter** is a potential required parameter for the override.

## Valid Usage (Implicit)

- **sType** **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_OVERRIDE_INFO_INTEL`
- **pNext** **must** be `NULL`
- **type** **must** be a valid `VkPerformanceOverrideTypeINTEL` value

Possible values of `VkPerformanceOverrideInfoINTEL::type`, specifying performance override types, are:

```

typedef enum VkPerformanceOverrideTypeINTEL {
    VK_PERFORMANCE_OVERRIDE_TYPE_NULL_HARDWARE_INTEL = 0,
    VK_PERFORMANCE_OVERRIDE_TYPE_FLUSH_GPU_CACHES_INTEL = 1,
    VK_PERFORMANCE_OVERRIDE_TYPE_MAX_ENUM_INTEL = 0x7FFFFFFF
} VkPerformanceOverrideTypeINTEL;

```

- `VK_PERFORMANCE_OVERRIDE_TYPE_NULL_HARDWARE_INTEL` turns all rendering operations into noop.
- `VK_PERFORMANCE_OVERRIDE_TYPE_FLUSH_GPU_CACHES_INTEL` stalls the stream of commands until all previously emitted commands have completed and all caches been flushed and invalidated.

Before submitting command buffers containing performance queries commands to a device queue, the application must acquire and set a performance query configuration. The configuration can be released once all command buffers containing performance query commands are not in a pending state.

```
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPerformanceConfigurationINTEL)
```

To acquire a device performance configuration, call:

```
VkResult vkAcquirePerformanceConfigurationINTEL(  
    VkDevice device,  
    const VkPerformanceConfigurationAcquireInfoINTEL* pAcquireInfo,  
    VkPerformanceConfigurationINTEL* pConfiguration);
```

- **device** is the logical device that the performance query commands will be submitted to.
- **pAcquireInfo** is a pointer to a `VkPerformanceConfigurationAcquireInfoINTEL` structure, specifying the performance configuration to acquire.
- **pConfiguration** is a pointer to a `VkPerformanceConfigurationINTEL` handle in which the resulting configuration object is returned.

## Valid Usage (Implicit)

- **device** **must** be a valid `VkDevice` handle
- **pAcquireInfo** **must** be a valid pointer to a `VkPerformanceConfigurationAcquireInfoINTEL` structure
- **pConfiguration** **must** be a valid pointer to a `VkPerformanceConfigurationINTEL` handle

## Return Codes

### Success

- `VK_SUCCESS`

### Failure

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkPerformanceConfigurationAcquireInfoINTEL` structure is defined as:

```
typedef struct VkPerformanceConfigurationAcquireInfoINTEL {  
    VkStructureType sType;  
    const void* pNext;  
    VkPerformanceConfigurationTypeINTEL type;  
} VkPerformanceConfigurationAcquireInfoINTEL;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to an extension-specific structure.
- **type** is one of the `VkPerformanceConfigurationTypeINTEL` type of performance configuration that will be acquired.

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PERFORMANCE_CONFIGURATION_ACQUIRE_INFO_INTEL`
- `pNext` **must** be `NULL`
- `type` **must** be a valid `VkPerformanceConfigurationTypeINTEL` value

Possible values of `VkPerformanceConfigurationAcquireInfoINTEL::type`, specifying performance configuration types, are:

```
typedef enum VkPerformanceConfigurationTypeINTEL {
    VK_PERFORMANCE_CONFIGURATION_TYPE_COMMAND_QUEUE_METRICS_DISCOVERY_ACTIVATED_INTEL
= 0,
    VK_PERFORMANCE_CONFIGURATION_TYPE_MAX_ENUM_INTEL = 0x7FFFFFFF
} VkPerformanceConfigurationTypeINTEL;
```

To set a performance configuration, call:

```
VkResult vkQueueSetPerformanceConfigurationINTEL(
    VkQueue                           queue,
    VkPerformanceConfigurationINTEL   configuration);
```

- `queue` is the queue on which the configuration will be used.
- `configuration` is the configuration to use.

## Valid Usage (Implicit)

- `queue` **must** be a valid `VkQueue` handle
- `configuration` **must** be a valid `VkPerformanceConfigurationINTEL` handle
- Both of `configuration`, and `queue` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
-	-	Any	-

## Return Codes

### Success

- VK\_SUCCESS

### Failure

- VK\_ERROR\_TOO\_MANY\_OBJECTS
- VK\_ERROR\_OUT\_OF\_HOST\_MEMORY

To release a device performance configuration, call:

```
VkResult vkReleasePerformanceConfigurationINTEL(  
    VkDevice           device,  
    VkPerformanceConfigurationINTEL configuration);
```

- **device** is the device associated to the configuration object to release.
- **configuration** is the configuration object to release.

## Valid Usage

- **configuration must** not be released before all command buffers submitted while the configuration was set are in **pending state**.

## Valid Usage (Implicit)

- **device must** be a valid **VkDevice** handle
- **configuration must** be a valid **VkPerformanceConfigurationINTEL** handle
- **configuration must** have been created, allocated, or retrieved from **device**

## Return Codes

### Success

- VK\_SUCCESS

### Failure

- VK\_ERROR\_TOO\_MANY\_OBJECTS
- VK\_ERROR\_OUT\_OF\_HOST\_MEMORY

# Chapter 18. Clear Commands

## 18.1. Clearing Images Outside A Render Pass Instance

Color and depth/stencil images **can** be cleared outside a render pass instance using [vkCmdClearColorImage](#) or [vkCmdClearDepthStencilImage](#), respectively. These commands are only allowed outside of a render pass instance.

To clear one or more subranges of a color image, call:

```
void vkCmdClearColorImage(  
    VkCommandBuffer  
    VkImage  
    VkImageLayout  
    const VkClearColorValue*  
    uint32_t  
    const VkImageSubresourceRange*  
                                commandBuffer,  
                                image,  
                                imageLayout,  
                                pColor,  
                                rangeCount,  
                                pRanges);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **image** is the image to be cleared.
- **imageLayout** specifies the current layout of the image subresource ranges to be cleared, and **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`.
- **pColor** is a pointer to a [VkClearColorValue](#) structure containing the values that the image subresource ranges will be cleared to (see [Clear Values](#) below).
- **rangeCount** is the number of image subresource range structures in **pRanges**.
- **pRanges** is a pointer to an array of [VkImageSubresourceRange](#) structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in [Image Views](#).

Each specified range in **pRanges** is cleared to the value specified by **pColor**.

## Valid Usage

- The `format features` of `image` **must** contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.
- `image` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag
- `image` **must** not use a format listed in `Formats requiring sampler Y'CBCR conversion for VK_IMAGE_ASPECT_COLOR_BIT image views`
- If `image` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `imageLayout` **must** specify the layout of the image subresource ranges of `image` specified in `pRanges` at the time this command is executed on a `VkDevice`
- `imageLayout` **must** be `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`
- The `VkImageSubresourceRange::aspectMask` members of the elements of the `pRanges` array **must** each only include `VK_IMAGE_ASPECT_COLOR_BIT`
- The `VkImageSubresourceRange::baseMipLevel` members of the elements of the `pRanges` array **must** each be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- For each `VkImageSubresourceRange` element of `pRanges`, if the `levelCount` member is not `VK_REMAINING_MIP_LEVELS`, then `baseMipLevel + levelCount` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- The `VkImageSubresourceRange::baseArrayLayer` members of the elements of the `pRanges` array **must** each be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- For each `VkImageSubresourceRange` element of `pRanges`, if the `layerCount` member is not `VK_REMAINING_ARRAY_LAYERS`, then `baseArrayLayer + layerCount` **must** be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- `image` **must** not have a compressed or depth/stencil format
- If `commandBuffer` is an unprotected command buffer, then `image` **must** not be a protected image
- If `commandBuffer` is a protected command buffer, then `image` **must** not be an unprotected image

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `image` **must** be a valid `VkImage` handle
- `imageLayout` **must** be a valid `VkImageLayout` value
- `pColor` **must** be a valid pointer to a valid `VkClearColorValue` union
- `pRanges` **must** be a valid pointer to an array of `rangeCount` valid `VkImageSubresourceRange` structures
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- This command **must** only be called outside of a render pass instance
- `rangeCount` **must** be greater than `0`
- Both of `commandBuffer`, and `image` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Outside	Graphics Compute	Transfer

To clear one or more subranges of a depth/stencil image, call:

```
void vkCmdClearDepthStencilImage(  
    VkCommandBuffer  
    VkImage  
    VkImageLayout  
    const VkClearDepthStencilValue*  
    uint32_t  
    const VkImageSubresourceRange*  
        commandBuffer,  
        image,  
        imageLayout,  
        pDepthStencil,  
        rangeCount,  
        pRanges);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

- `image` is the image to be cleared.
- `imageLayout` specifies the current layout of the image subresource ranges to be cleared, and **must** be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`.
- `pDepthStencil` is a pointer to a `VkClearDepthStencilValue` structure containing the values that the depth and stencil image subresource ranges will be cleared to (see [Clear Values](#) below).
- `rangeCount` is the number of image subresource range structures in `pRanges`.
- `pRanges` is a pointer to an array of `VkImageSubresourceRange` structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in [Image Views](#).

## Valid Usage

- The `format` features of `image` **must** contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.
- If any element of `pRanges.aspect` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, and `image` was created with `separate stencil usage`, `VK_IMAGE_USAGE_TRANSFER_DST_BIT` **must** have been included in the `VkImageStencilUsageCreateInfoEXT::stencilUsage` used to create `image`
- If any element of `pRanges.aspect` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, and `image` was not created with `separate stencil usage`, `VK_IMAGE_USAGE_TRANSFER_DST_BIT` **must** have been included in the `VkImageCreateInfo::usage` used to create `image`
- If any element of `pRanges.aspect` includes `VK_IMAGE_ASPECT_DEPTH_BIT`, `VK_IMAGE_USAGE_TRANSFER_DST_BIT` **must** have been included in the `VkImageCreateInfo::usage` used to create `image`
- If `image` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `imageLayout` **must** specify the layout of the image subresource ranges of `image` specified in `pRanges` at the time this command is executed on a `VkDevice`
- `imageLayout` **must** be either of `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`
- The `VkImageSubresourceRange::aspectMask` members of the elements of the `pRanges` array **must** each only include `VK_IMAGE_ASPECT_DEPTH_BIT` if the image format has a depth component
- The `VkImageSubresourceRange::aspectMask` members of the elements of the `pRanges` array **must** each only include `VK_IMAGE_ASPECT_STENCIL_BIT` if the image format has a stencil component
- The `VkImageSubresourceRange::baseMipLevel` members of the elements of the `pRanges` array **must** each be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- For each `VkImageSubresourceRange` element of `pRanges`, if the `levelCount` member is not `VK_REMAINING_MIP_LEVELS`, then `baseMipLevel + levelCount` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created
- The `VkImageSubresourceRange::baseArrayLayer` members of the elements of the `pRanges` array **must** each be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- For each `VkImageSubresourceRange` element of `pRanges`, if the `layerCount` member is not `VK_REMAINING_ARRAY_LAYERS`, then `baseArrayLayer + layerCount` **must** be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created
- `image` **must** have a depth/stencil format
- If `commandBuffer` is an unprotected command buffer, then `image` **must** not be a protected image
- If `commandBuffer` is a protected command buffer, then `image` **must** not be an unprotected image

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `image` **must** be a valid `VkImage` handle
- `imageLayout` **must** be a valid `VkImageLayout` value
- `pDepthStencil` **must** be a valid pointer to a valid `VkClearDepthStencilValue` structure
- `pRanges` **must** be a valid pointer to an array of `rangeCount` valid `VkImageSubresourceRange` structures
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called outside of a render pass instance
- `rangeCount` **must** be greater than `0`
- Both of `commandBuffer`, and `image` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Outside	Graphics	Transfer

Clears outside render pass instances are treated as transfer operations for the purposes of memory barriers.

## 18.2. Clearing Images Inside A Render Pass Instance

To clear one or more regions of color and depth/stencil attachments inside a render pass instance, call:

```
void vkCmdClearAttachments(  
    VkCommandBuffer  
    uint32_t  
    const VkClearAttachment*  
    uint32_t  
    const VkClearRect*  
                                commandBuffer,  
                                attachmentCount,  
                                pAttachments,  
                                rectCount,  
                                pRects);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `attachmentCount` is the number of entries in the `pAttachments` array.
- `pAttachments` is a pointer to an array of `VkClearAttachment` structures defining the attachments to clear and the clear values to use. If any attachment to be cleared in the current subpass is `VK_ATTACHMENT_UNUSED`, then the clear has no effect on that attachment.
- `rectCount` is the number of entries in the `pRects` array.
- `pRects` is a pointer to an array of `VkClearRect` structures defining regions within each selected attachment to clear.

`vkCmdClearAttachments` can clear multiple regions of each attachment used in the current subpass of a render pass instance. This command must be called only inside a render pass instance, and implicitly selects the images to clear based on the current framebuffer attachments and the command parameters.

If the render pass has a [fragment density map attachment](#), clears follow the [operations of fragment density maps](#) as if each clear region was a primitive which generates fragments. The clear color is applied to all pixels inside each fragment's area regardless if the pixels lie outside of the clear region. Clears may have a different set of supported fragment areas than draws.

Unlike other [clear commands](#), `vkCmdClearAttachments` executes as a drawing command, rather than a transfer command, with writes performed by it executing in [rasterization order](#). Clears to color attachments are executed as color attachment writes, by the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` stage. Clears to depth/stencil attachments are executed as [depth writes](#) and [writes](#) by the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` and `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` stages.

## Valid Usage

- If the `aspectMask` member of any element of `pAttachments` contains `VK_IMAGE_ASPECT_COLOR_BIT`, then the `colorAttachment` member of that element **must** either refer to a color attachment which is `VK_ATTACHMENT_UNUSED`, or **must** be a valid color attachment.
- If the `aspectMask` member of any element of `pAttachments` contains `VK_IMAGE_ASPECT_DEPTH_BIT`, then the current subpass' depth/stencil attachment **must** either be `VK_ATTACHMENT_UNUSED`, or **must** have a depth component
- If the `aspectMask` member of any element of `pAttachments` contains `VK_IMAGE_ASPECT_STENCIL_BIT`, then the current subpass' depth/stencil attachment **must** either be `VK_ATTACHMENT_UNUSED`, or **must** have a stencil component
- The `rect` member of each element of `pRects` **must** have an `extent.width` greater than `0`
- The `rect` member of each element of `pRects` **must** have an `extent.height` greater than `0`
- The rectangular region specified by each element of `pRects` **must** be contained within the render area of the current render pass instance
- The layers specified by each element of `pRects` **must** be contained within every attachment that `pAttachments` refers to
- The `layerCount` member of each element of `pRects` **must** not be `0`
- If `commandBuffer` is an unprotected command buffer, then each attachment to be cleared **must** not be a protected image.
- If `commandBuffer` is a protected command buffer, then each attachment to be cleared **must** not be an unprotected image.
- If the render pass instance this is recorded in uses multiview, then `baseArrayLayer` **must** be zero and `layerCount` **must** be one.

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkClearAttachment` structures
- `pRects` **must** be a valid pointer to an array of `rectCount` `VkClearRect` structures
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called inside of a render pass instance
- `attachmentCount` **must** be greater than `0`
- `rectCount` **must** be greater than `0`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Inside	Graphics	Graphics

The `VkClearRect` structure is defined as:

```
typedef struct VkClearRect {  
    VkRect2D      rect;  
    uint32_t      baseArrayLayer;  
    uint32_t      layerCount;  
} VkClearRect;
```

- `rect` is the two-dimensional region to be cleared.
- `baseArrayLayer` is the first layer to be cleared.
- `layerCount` is the number of layers to clear.

The layers `[baseArrayLayer, baseArrayLayer + layerCount)` counting from the base layer of the attachment image view are cleared.

The `VkClearAttachment` structure is defined as:

```
typedef struct VkClearAttachment {  
    VkImageAspectFlags aspectMask;  
    uint32_t          colorAttachment;  
    VkClearValue      clearValue;  
} VkClearAttachment;
```

- `aspectMask` is a mask selecting the color, depth and/or stencil aspects of the attachment to be cleared.
- `colorAttachment` is only meaningful if `VK_IMAGE_ASPECT_COLOR_BIT` is set in `aspectMask`, in which case it is an index to the `pColorAttachments` array in the `VkSubpassDescription` structure of the current subpass which selects the color attachment to clear.
- `clearValue` is the color or depth/stencil value to clear the attachment to, as described in [Clear](#)

Values below.

No memory barriers are needed between `vkCmdClearAttachments` and preceding or subsequent draw or attachment clear commands in the same subpass.

The `vkCmdClearAttachments` command is not affected by the bound pipeline state.

Attachments **can** also be cleared at the beginning of a render pass instance by setting `loadOp` (or `stencilLoadOp`) of `VkAttachmentDescription` to `VK_ATTACHMENT_LOAD_OP_CLEAR`, as described for `vkCreateRenderPass`.

### Valid Usage

- If `aspectMask` includes `VK_IMAGE_ASPECT_COLOR_BIT`, it **must** not include `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`
- `aspectMask` **must** not include `VK_IMAGE_ASPECT_METADATA_BIT`
- `aspectMask` **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index `i`.
- `clearValue` **must** be a valid `VkClearColorValue` union

### Valid Usage (Implicit)

- `aspectMask` **must** be a valid combination of `VkImageAspectFlagBits` values
- `aspectMask` **must** not be `0`

## 18.3. Clear Values

The `VkClearColorValue` structure is defined as:

```
typedef union VkClearColorValue {
    float      float32[4];
    int32_t    int32[4];
    uint32_t   uint32[4];
} VkClearColorValue;
```

- `float32` are the color clear values when the format of the image or attachment is one of the formats in the [Interpretation of Numeric Format](#) table other than signed integer (`SINT`) or unsigned integer (`UINT`). Floating point values are automatically converted to the format of the image, with the clear value being treated as linear if the image is sRGB.
- `int32` are the color clear values when the format of the image or attachment is signed integer (`SINT`). Signed integer values are converted to the format of the image by casting to the smaller type (with negative 32-bit values mapping to negative values in the smaller type). If the integer clear value is not representable in the target type (e.g. would overflow in conversion to that type), the clear value is undefined.

- `uint32` are the color clear values when the format of the image or attachment is unsigned integer (`UINT`). Unsigned integer values are converted to the format of the image by casting to the integer type with fewer bits.

The four array elements of the clear color map to R, G, B, and A components of image formats, in order.

If the image has more than one sample, the same value is written to all samples for any pixels being cleared.

The `VkClearDepthStencilValue` structure is defined as:

```
typedef struct VkClearDepthStencilValue {
    float      depth;
    uint32_t   stencil;
} VkClearDepthStencilValue;
```

- `depth` is the clear value for the depth aspect of the depth/stencil attachment. It is a floating-point value which is automatically converted to the attachment's format.
- `stencil` is the clear value for the stencil aspect of the depth/stencil attachment. It is a 32-bit integer value which is converted to the attachment's format by taking the appropriate number of LSBs.

### Valid Usage

- Unless the `VK_EXT_depth_range_unrestricted` extension is enabled `depth` **must** be between `0.0` and `1.0`, inclusive

The `VkClearValue` union is defined as:

```
typedef union VkClearValue {
    VkClearColorValue        color;
    VkClearDepthStencilValue depthStencil;
} VkClearValue;
```

- `color` specifies the color image clear values to use when clearing a color image or attachment.
- `depthStencil` specifies the depth and stencil clear values to use when clearing a depth/stencil image or attachment.

This union is used where part of the API requires either color or depth/stencil clear values, depending on the attachment, and defines the initial clear values in the `VkRenderPassBeginInfo` structure.

## 18.4. Filling Buffers

To clear buffer data, call:

```
void vkCmdFillBuffer(  
    VkCommandBuffer           commandBuffer,  
    VkBuffer                  dstBuffer,  
    VkDeviceSize              dstOffset,  
    VkDeviceSize              size,  
    uint32_t                 data);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `dstBuffer` is the buffer to be filled.
- `dstOffset` is the byte offset into the buffer at which to start filling, and **must** be a multiple of 4.
- `size` is the number of bytes to fill, and **must** be either a multiple of 4, or `VK_WHOLE_SIZE` to fill the range from `offset` to the end of the buffer. If `VK_WHOLE_SIZE` is used and the remaining size of the buffer is not a multiple of 4, then the nearest smaller multiple is used.
- `data` is the 4-byte word written repeatedly to the buffer to fill `size` bytes of data. The data word is written to memory according to the host endianness.

`vkCmdFillBuffer` is treated as “transfer” operation for the purposes of synchronization barriers. The `VK_BUFFER_USAGE_TRANSFER_DST_BIT` **must** be specified in `usage` of `VkBufferCreateInfo` in order for the buffer to be compatible with `vkCmdFillBuffer`.

### Valid Usage

- `dstOffset` **must** be less than the size of `dstBuffer`
- `dstOffset` **must** be a multiple of 4
- If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be greater than 0
- If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be less than or equal to the size of `dstBuffer` minus `dstOffset`
- If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be a multiple of 4
- `dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag
- If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- If `commandBuffer` is an unprotected command buffer, then `dstBuffer` **must** not be a protected buffer
- If `commandBuffer` is a protected command buffer, then `dstBuffer` **must** not be an unprotected buffer

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `dstBuffer` **must** be a valid `VkBuffer` handle
- `commandBuffer` **must** be in the `recording state`
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics or compute operations
- This command **must** only be called outside of a render pass instance
- Both of `commandBuffer`, and `dstBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Outside	Transfer Graphics Compute	Transfer

## 18.5. Updating Buffers

To update buffer data inline in a command buffer, call:

```
void vkCmdUpdateBuffer(  
    VkCommandBuffer  
    VkBuffer  
    VkDeviceSize  
    VkDeviceSize  
    const void*
```

```
                                commandBuffer,  
                                dstBuffer,  
                                dstOffset,  
                                dataSize,  
                                pData);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `dstBuffer` is a handle to the buffer to be updated.
- `dstOffset` is the byte offset into the buffer to start updating, and **must** be a multiple of 4.
- `dataSize` is the number of bytes to update, and **must** be a multiple of 4.

- `pData` is a pointer to the source data for the buffer update, and **must** be at least `dataSize` bytes in size.

`dataSize` **must** be less than or equal to 65536 bytes. For larger updates, applications **can** use buffer to buffer [copies](#).

*Note*

Buffer updates performed with `vkCmdUpdateBuffer` first copy the data into command buffer memory when the command is recorded (which requires additional storage and may incur an additional allocation), and then copy the data from the command buffer into `dstBuffer` when the command is executed on a device.

The additional cost of this functionality compared to [buffer to buffer copies](#) means it is only recommended for very small amounts of data, and is why it is limited to only 65536 bytes.

Applications **can** work around this by issuing multiple `vkCmdUpdateBuffer` commands to different ranges of the same buffer, but it is strongly recommended that they **should not**.

The source data is copied from the user pointer to the command buffer when the command is called.

`vkCmdUpdateBuffer` is only allowed outside of a render pass. This command is treated as “transfer” operation, for the purposes of synchronization barriers. The `VK_BUFFER_USAGE_TRANSFER_DST_BIT` **must** be specified in `usage` of `VkBufferCreateInfo` in order for the buffer to be compatible with `vkCmdUpdateBuffer`.

## Valid Usage

- `dstOffset` **must** be less than the size of `dstBuffer`
- `dataSize` **must** be less than or equal to the size of `dstBuffer` minus `dstOffset`
- `dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag
- If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `dstOffset` **must** be a multiple of 4
- `dataSize` **must** be less than or equal to 65536
- `dataSize` **must** be a multiple of 4
- If `commandBuffer` is an unprotected command buffer, then `dstBuffer` **must** not be a protected buffer
- If `commandBuffer` is a protected command buffer, then `dstBuffer` **must** not be an unprotected buffer

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `dstBuffer` **must** be a valid `VkBuffer` handle
- `pData` **must** be a valid pointer to an array of `dataSize` bytes
- `commandBuffer` **must** be in the `recording state`
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations
- This command **must** only be called outside of a render pass instance
- `dataSize` **must** be greater than `0`
- Both of `commandBuffer`, and `dstBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Outside	Transfer Graphics Compute	Transfer

### Note

The `pData` parameter was of type `uint32_t*` instead of `void*` prior to version 1.0.19 of the Specification and `VK_HEADER_VERSION` 19 of the [Vulkan Header Files](#). This was a historical anomaly, as the source data may be of other types.

# Chapter 19. Copy Commands

An application **can** copy buffer and image data using several methods depending on the type of data transfer. Data **can** be copied between buffer objects with `vkCmdCopyBuffer` and a portion of an image **can** be copied to another image with `vkCmdCopyImage`. Image data **can** also be copied to and from buffer memory using `vkCmdCopyImageToBuffer` and `vkCmdCopyBufferToImage`. Image data **can** be blitted (with or without scaling and filtering) with `vkCmdBlitImage`. Multisampled images **can** be resolved to a non-multisampled image with `vkCmdResolveImage`.

## 19.1. Common Operation

The following valid usage rules apply to all copy commands:

- Copy commands **must** be recorded outside of a render pass instance.
- The set of all bytes bound to all the source regions **must** not overlap the set of all bytes bound to the destination regions.
- The set of all bytes bound to each destination region **must** not overlap the set of all bytes bound to another destination region.
- Copy regions **must** be non-empty.
- Regions **must** not extend outside the bounds of the buffer or image level, except that regions of compressed images **can** extend as far as the dimension of the image level rounded up to a complete compressed texel block.
- Source image subresources **must** be in either the `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` layout. Destination image subresources **must** be in the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` layout. As a consequence, if an image subresource is used as both source and destination of a copy, it **must** be in the `VK_IMAGE_LAYOUT_GENERAL` layout.
- Source images **must** have `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT` in their **format features**.
- Destination images **must** have `VK_FORMAT_FEATURE_TRANSFER_DST_BIT` in their **format features**.
- Source buffers **must** have been created with the `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage bit enabled and destination buffers **must** have been created with the `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage bit enabled.
- If the stencil aspect of source image is accessed, and the source image was not created with **separate stencil usage**, the source image **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` set in `VkImageCreateInfo::usage`
- If the stencil aspect of destination image is accessed, and the destination image was not created with **separate stencil usage**, the destination image **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` set in `VkImageCreateInfo::usage`
- If the stencil aspect of source image is accessed, and the source image was created with **separate stencil usage**, the source image **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` set in `VkImageStencilUsageCreateInfoEXT::stencilUsage`
- If the stencil aspect of destination image is accessed, and the destination image was created

with `separate stencil usage`, the destination image **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` set in `VkImageStencilUsageCreateInfoEXT::stencilUsage`

- If non-stencil aspects of a source image are accessed, the source image **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` set in `VkImageCreateInfo::usage`
- If non-stencil aspects of a source image are accessed, the source image **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` set in `VkImageCreateInfo::usage`

All copy commands are treated as “transfer” operations for the purposes of synchronization barriers.

## 19.2. Copying Data Between Buffers

To copy data between buffer objects, call:

```
void vkCmdCopyBuffer(  
    VkCommandBuffer  
    VkBuffer  
    VkBuffer  
    uint32_t  
    const VkBufferCopy*
```

`commandBuffer,`  
`srcBuffer,`  
`dstBuffer,`  
`regionCount,`  
`pRegions);`

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcBuffer` is the source buffer.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferCopy` structures specifying the regions to copy.

Each region in `pRegions` is copied from the source buffer to the same region of the destination buffer. `srcBuffer` and `dstBuffer` **can** be the same buffer or alias the same memory, but the resulting values are undefined if the copy regions overlap in memory.

## Valid Usage

- The `srcOffset` member of each element of `pRegions` **must** be less than the size of `srcBuffer`
- The `dstOffset` member of each element of `pRegions` **must** be less than the size of `dstBuffer`
- The `size` member of each element of `pRegions` **must** be less than or equal to the size of `srcBuffer` minus `srcOffset`
- The `size` member of each element of `pRegions` **must** be less than or equal to the size of `dstBuffer` minus `dstOffset`
- The union of the source regions, and the union of the destination regions, specified by the elements of `pRegions`, **must** not overlap in memory
- `srcBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag
- If `srcBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag
- If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- If `commandBuffer` is an unprotected command buffer, then `srcBuffer` **must** not be a protected buffer
- If `commandBuffer` is an unprotected command buffer, then `dstBuffer` **must** not be a protected buffer
- If `commandBuffer` is a protected command buffer, then `dstBuffer` **must** not be an unprotected buffer

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `srcBuffer` **must** be a valid `VkBuffer` handle
- `dstBuffer` **must** be a valid `VkBuffer` handle
- `pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkBufferCopy` structures
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations
- This command **must** only be called outside of a render pass instance
- `regionCount` **must** be greater than 0
- Each of `commandBuffer`, `dstBuffer`, and `srcBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Outside	Transfer Graphics Compute	Transfer

The `VkBufferCopy` structure is defined as:

```
typedef struct VkBufferCopy {
    VkDeviceSize    srcOffset;
    VkDeviceSize    dstOffset;
    VkDeviceSize    size;
} VkBufferCopy;
```

- `srcOffset` is the starting offset in bytes from the start of `srcBuffer`.
- `dstOffset` is the starting offset in bytes from the start of `dstBuffer`.
- `size` is the number of bytes to copy.

## Valid Usage

- The `size` **must** be greater than `0`

## 19.3. Copying Data Between Images

`vkCmdCopyImage` performs image copies in a similar manner to a host `memcpy`. It does not perform general-purpose conversions such as scaling, resizing, blending, color-space conversion, or format conversions. Rather, it simply copies raw image data. `vkCmdCopyImage` **can** copy between images with different formats, provided the formats are compatible as defined below.

To copy data between image objects, call:

```

void vkCmdCopyImage(
    VkCommandBuffer
    VkImage
    VkImageLayout
    VkImage
    VkImageLayout
    uint32_t
    const VkImageCopy*

```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the current layout of the source image subresource.
- `dstImage` is the destination image.
- `dstImageLayout` is the current layout of the destination image subresource.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy` structures specifying the regions to copy.

Each region in `pRegions` is copied from the source image to the same region of the destination image. `srcImage` and `dstImage` **can** be the same image or alias the same memory.

The formats of `srcImage` and `dstImage` **must** be compatible. Formats are compatible if they share the same class, as shown in the [Compatible Formats](#) table. Depth/stencil formats **must** match exactly.

If the format of `srcImage` or `dstImage` is a [multi-planar image format](#), regions of each plane to be copied **must** be specified separately using the `srcSubresource` and `dstSubresource` members of the `VkImageCopy` structure. In this case, the `aspectMask` of the `srcSubresource` or `dstSubresource` that refers to the multi-planar image **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`. For the purposes of `vkCmdCopyImage`, each plane of a multi-planar image is treated as having the format listed in [Compatible formats of planes of multi-planar formats](#) for the plane identified by the `aspectMask` of the corresponding subresource. This applies both to `VkFormat` and to coordinates used in the copy, which correspond to texels in the *plane* rather than how these texels map to coordinates in the image as a whole.

#### Note

For example, the `VK_IMAGE_ASPECT_PLANE_1_BIT` plane of a `VK_FORMAT_G8_B8R8_2PLANE_420_UNORM` image is compatible with an image of format `VK_FORMAT_R8G8_UNORM` and (less usefully) with the `VK_IMAGE_ASPECT_PLANE_0_BIT` plane of an image of format `VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_420_UNORM_3PACK16`, as each texel is 2 bytes in size.

`vkCmdCopyImage` allows copying between *size-compatible* compressed and uncompressed internal formats. Formats are size-compatible if the texel block size of the uncompressed format is equal to the texel block size of the compressed format. Such a copy does not perform on-the-fly compression or decompression. When copying from an uncompressed format to a compressed format, each

texel of uncompressed data of the source image is copied as a raw value to the corresponding compressed texel block of the destination image. When copying from a compressed format to an uncompressed format, each compressed texel block of the source image is copied as a raw value to the corresponding texel of uncompressed data in the destination image. Thus, for example, it is legal to copy between a 128-bit uncompressed format and a compressed format which has a 128-bit sized compressed texel block representing  $4 \times 4$  texels (using 8 bits per texel), or between a 64-bit uncompressed format and a compressed format which has a 64-bit sized compressed texel block representing  $4 \times 4$  texels (using 4 bits per texel).

When copying between compressed and uncompressed formats the `extent` members represent the texel dimensions of the source image and not the destination. When copying from a compressed image to an uncompressed image the image texel dimensions written to the uncompressed image will be source extent divided by the compressed texel block dimensions. When copying from an uncompressed image to a compressed image the image texel dimensions written to the compressed image will be the source extent multiplied by the compressed texel block dimensions. In both cases the number of bytes read and the number of bytes written will be identical.

Copying to or from block-compressed images is typically done in multiples of the compressed texel block size. For this reason the `extent` **must** be a multiple of the compressed texel block dimension. There is one exception to this rule which is **required** to handle compressed images created with dimensions that are not a multiple of the compressed texel block dimensions: if the `srcImage` is compressed, then:

- If `extent.width` is not a multiple of the compressed texel block width, then (`extent.width + srcOffset.x`) **must** equal the image subresource width.
- If `extent.height` is not a multiple of the compressed texel block height, then (`extent.height + srcOffset.y`) **must** equal the image subresource height.
- If `extent.depth` is not a multiple of the compressed texel block depth, then (`extent.depth + srcOffset.z`) **must** equal the image subresource depth.

Similarly, if the `dstImage` is compressed, then:

- If `extent.width` is not a multiple of the compressed texel block width, then (`extent.width + dstOffset.x`) **must** equal the image subresource width.
- If `extent.height` is not a multiple of the compressed texel block height, then (`extent.height + dstOffset.y`) **must** equal the image subresource height.
- If `extent.depth` is not a multiple of the compressed texel block depth, then (`extent.depth + dstOffset.z`) **must** equal the image subresource depth.

This allows the last compressed texel block of the image in each non-multiple dimension to be included as a source or destination of the copy.

“[\\_422](#)” image formats that are not *multi-planar* are treated as having a  $2 \times 1$  compressed texel block for the purposes of these rules.

`vkCmdCopyImage` **can** be used to copy image data between multisample images, but both images **must** have the same number of samples.

## Valid Usage

- The source region specified by each element of `pRegions` **must** be a region that is contained within `srcImage` if the `srcImage`'s `VkFormat` is not a `multi-planar format`, and **must** be a region that is contained within the plane being copied if the `srcImage`'s `VkFormat` is a multi-planar format
- The destination region specified by each element of `pRegions` **must** be a region that is contained within `dstImage` if the `dstImage`'s `VkFormat` is not a `multi-planar format`, and **must** be a region that is contained within the plane being copied to if the `dstImage`'s `VkFormat` is a multi-planar format
- The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory
- The `format features` of `srcImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`.
- `srcImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag
- If `srcImage` is non-sparse then the image or *disjoint* plane to be copied **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- `srcImageLayout` **must** be `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`
- The `format features` of `dstImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.
- `dstImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag
- If `dstImage` is non-sparse then the image or *disjoint* plane that is the destination of the copy **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`
- If the `VkFormat` of each of `srcImage` and `dstImage` is not a `multi-planar format`, the `VkFormat` of each of `srcImage` and `dstImage` **must** be compatible, as defined [above](#)
- In a copy to or from a plane of a `multi-planar image`, the `VkFormat` of the image and plane **must** be compatible according to the description of `compatible planes` for the plane being copied
- When a copy is performed to or from an image with a `multi-planar format`, the `aspectMask` of the `srcSubresource` and/or `dstSubresource` that refers to the multi-planar image **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT` (with `VK_IMAGE_ASPECT_PLANE_2_BIT` valid only for a `VkFormat` with three planes)
- The sample count of `srcImage` and `dstImage` **must** match
- If `commandBuffer` is an unprotected command buffer, then `srcImage` **must** not be a protected image

- If `commandBuffer` is an unprotected command buffer, then `dstImage` **must** not be a protected image
- If `commandBuffer` is a protected command buffer, then `dstImage` **must** not be an unprotected image
- The `srcSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created
- The `dstSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created
- The `srcSubresource.baseArrayLayer` + `srcSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created
- The `dstSubresource.baseArrayLayer` + `dstSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created
- The `srcOffset` and `extent` members of each element of `pRegions` **must** respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`
- The `dstOffset` and `extent` members of each element of `pRegions` **must** respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`
- `dstImage` and `srcImage` **must** not have been created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `srcImage` **must** be a valid `VkImage` handle
- `srcImageLayout` **must** be a valid `VkImageLayout` value
- `dstImage` **must** be a valid `VkImage` handle
- `dstImageLayout` **must** be a valid `VkImageLayout` value
- `pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkImageCopy` structures
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations
- This command **must** only be called outside of a render pass instance
- `regionCount` **must** be greater than `0`
- Each of `commandBuffer`, `dstImage`, and `srcImage` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Outside	Transfer Graphics Compute	Transfer

The `VkImageCopy` structure is defined as:

```
typedef struct VkImageCopy {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D             srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D             dstOffset;
    VkExtent3D              extent;
} VkImageCopy;
```

- `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively.
- `srcOffset` and `dstOffset` select the initial `x`, `y`, and `z` offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the image to copy in `width`, `height` and `depth`.

For `VK_IMAGE_TYPE_3D` images, copies are performed slice by slice starting with the `z` member of the `srcOffset` or `dstOffset`, and copying `depth` slices. For images with multiple layers, copies are performed layer by layer starting with the `baseArrayLayer` member of the `srcSubresource` or `dstSubresource` and copying `layerCount` layers. Image data **can** be copied between images with different image types. If one image is `VK_IMAGE_TYPE_3D` and the other image is `VK_IMAGE_TYPE_2D` with multiple layers, then each slice is copied to or from a different layer.

Copies involving a [multi-planar image format](#) specify the region to be copied in terms of the *plane* to be copied, not the coordinates of the multi-planar image. This means that copies accessing the R/B planes of “`_422`” format images **must** fit the copied region within half the `width` of the parent image, and that copies accessing the R/B planes of “`_420`” format images **must** fit the copied region within half the `width` and `height` of the parent image.

## Valid Usage

- If neither the calling command's `srcImage` nor the calling command's `dstImage` has a [multi-planar image format](#) then the `aspectMask` member of `srcSubresource` and `dstSubresource` **must** match
- If the calling command's `srcImage` has a `VkFormat` with [two planes](#) then the `srcSubresource aspectMask` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT` or `VK_IMAGE_ASPECT_PLANE_1_BIT`
- If the calling command's `srcImage` has a `VkFormat` with [three planes](#) then the `srcSubresource aspectMask` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`
- If the calling command's `dstImage` has a `VkFormat` with [two planes](#) then the `dstSubresource aspectMask` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT` or `VK_IMAGE_ASPECT_PLANE_1_BIT`
- If the calling command's `dstImage` has a `VkFormat` with [three planes](#) then the `dstSubresource aspectMask` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`
- If the calling command's `srcImage` has a [multi-planar image format](#) and the `dstImage` does not have a multi-planar image format, the `dstSubresource aspectMask` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`
- If the calling command's `dstImage` has a [multi-planar image format](#) and the `srcImage` does not have a multi-planar image format, the `srcSubresource aspectMask` **must** be `VK_IMAGE_ASPECT_COLOR_BIT`
- The number of slices of the `extent` (for 3D) or layers of the `srcSubresource` (for non-3D) **must** match the number of slices of the `extent` (for 3D) or layers of the `dstSubresource` (for non-3D)
- If either of the calling command's `srcImage` or `dstImage` parameters are of `VkImageType VK_IMAGE_TYPE_3D`, the `baseArrayLayer` and `layerCount` members of the corresponding subresource **must** be `0` and `1`, respectively
- The `aspectMask` member of `srcSubresource` **must** specify aspects present in the calling command's `srcImage`
- The `aspectMask` member of `dstSubresource` **must** specify aspects present in the calling command's `dstImage`
- `srcOffset.x` and  $(\text{extent.width} + \text{srcOffset.x})$  **must** both be greater than or equal to `0` and less than or equal to the source image subresource width
- `srcOffset.y` and  $(\text{extent.height} + \text{srcOffset.y})$  **must** both be greater than or equal to `0` and less than or equal to the source image subresource height
- If the calling command's `srcImage` is of type `VK_IMAGE_TYPE_1D`, then `srcOffset.y` **must** be `0` and `extent.height` **must** be `1`.
- `srcOffset.z` and  $(\text{extent.depth} + \text{srcOffset.z})$  **must** both be greater than or equal to `0` and less than or equal to the source image subresource depth
- If the calling command's `srcImage` is of type `VK_IMAGE_TYPE_1D`, then `srcOffset.z` **must** be `0`

and `extent.depth` must be 1.

- If the calling command's `dstImage` is of type `VK_IMAGE_TYPE_1D`, then `dstOffset.z` must be 0 and `extent.depth` must be 1.
- If the calling command's `srcImage` is of type `VK_IMAGE_TYPE_2D`, then `srcOffset.z` must be 0.
- If the calling command's `dstImage` is of type `VK_IMAGE_TYPE_2D`, then `dstOffset.z` must be 0.
- If both `srcImage` and `dstImage` are of type `VK_IMAGE_TYPE_2D` then `extent.depth` must be 1.
- If the calling command's `srcImage` is of type `VK_IMAGE_TYPE_2D`, and the `dstImage` is of type `VK_IMAGE_TYPE_3D`, then `extent.depth` must equal to the `layerCount` member of `srcSubresource`.
- If the calling command's `dstImage` is of type `VK_IMAGE_TYPE_2D`, and the `srcImage` is of type `VK_IMAGE_TYPE_3D`, then `extent.depth` must equal to the `layerCount` member of `dstSubresource`.
- `dstOffset.x` and  $(\text{extent.width} + \text{dstOffset.x})$  must both be greater than or equal to 0 and less than or equal to the destination image subresource width
- `dstOffset.y` and  $(\text{extent.height} + \text{dstOffset.y})$  must both be greater than or equal to 0 and less than or equal to the destination image subresource height
- If the calling command's `dstImage` is of type `VK_IMAGE_TYPE_1D`, then `dstOffset.y` must be 0 and `extent.height` must be 1.
- `dstOffset.z` and  $(\text{extent.depth} + \text{dstOffset.z})$  must both be greater than or equal to 0 and less than or equal to the destination image subresource depth
- If the calling command's `srcImage` is a compressed image, or a *single-plane*, “[\\_422](#)” image format, all members of `srcOffset` must be a multiple of the corresponding dimensions of the compressed texel block
- If the calling command's `srcImage` is a compressed image, or a *single-plane*, “[\\_422](#)” image format, `extent.width` must be a multiple of the compressed texel block width or  $(\text{extent.width} + \text{srcOffset.x})$  must equal the source image subresource width
- If the calling command's `srcImage` is a compressed image, or a *single-plane*, “[\\_422](#)” image format, `extent.height` must be a multiple of the compressed texel block height or  $(\text{extent.height} + \text{srcOffset.y})$  must equal the source image subresource height
- If the calling command's `srcImage` is a compressed image, or a *single-plane*, “[\\_422](#)” image format, `extent.depth` must be a multiple of the compressed texel block depth or  $(\text{extent.depth} + \text{srcOffset.z})$  must equal the source image subresource depth
- If the calling command's `dstImage` is a compressed format image, or a *single-plane*, “[\\_422](#)” image format, all members of `dstOffset` must be a multiple of the corresponding dimensions of the compressed texel block
- If the calling command's `dstImage` is a compressed format image, or a *single-plane*, “[\\_422](#)” image format, `extent.width` must be a multiple of the compressed texel block width or  $(\text{extent.width} + \text{dstOffset.x})$  must equal the destination image subresource width
- If the calling command's `dstImage` is a compressed format image, or a *single-plane*, “[\\_422](#)” image format, `extent.height` must be a multiple of the compressed texel block height or  $(\text{extent.height} + \text{dstOffset.y})$  must equal the destination image subresource height

- If the calling command's `dstImage` is a compressed format image, or a *single-plane*, “[\\_422](#)” image format, `extent.depth` **must** be a multiple of the compressed texel block depth or `(extent.depth + dstOffset.z)` **must** equal the destination image subresource depth

## Valid Usage (Implicit)

- `srcSubresource` **must** be a valid `VkImageSubresourceLayers` structure
- `dstSubresource` **must** be a valid `VkImageSubresourceLayers` structure

The `VkImageSubresourceLayers` structure is defined as:

```
typedef struct VkImageSubresourceLayers {
    VkImageAspectFlags aspectMask;
    uint32_t          mipLevel;
    uint32_t          baseArrayLayer;
    uint32_t          layerCount;
} VkImageSubresourceLayers;
```

- `aspectMask` is a combination of `VkImageAspectFlagBits`, selecting the color, depth and/or stencil aspects to be copied.
- `mipLevel` is the mipmap level to copy from.
- `baseArrayLayer` and `layerCount` are the starting layer and number of layers to copy.

## Valid Usage

- If `aspectMask` contains `VK_IMAGE_ASPECT_COLOR_BIT`, it **must** not contain either of `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`
- `aspectMask` **must** not contain `VK_IMAGE_ASPECT_METADATA_BIT`
- `aspectMask` **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index `i`.
- `layerCount` **must** be greater than 0

## Valid Usage (Implicit)

- `aspectMask` **must** be a valid combination of `VkImageAspectFlagBits` values
- `aspectMask` **must** not be 0

## 19.4. Copying Data Between Buffers and Images

To copy data from a buffer object to an image object, call:

```
void vkCmdCopyBufferToImage(  
    VkCommandBuffer  
    VkBuffer  
    VkImage  
    VkImageLayout  
    uint32_t  
    const VkBufferImageCopy*
```

```
        commandBuffer,  
        srcBuffer,  
        dstImage,  
        dstImageLayout,  
        regionCount,  
        pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcBuffer` is the source buffer.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the copy.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferImageCopy` structures specifying the regions to copy.

Each region in `pRegions` is copied from the specified region of the source buffer to the specified region of the destination image.

If the format of `dstImage` is a [multi-planar image format](#)), regions of each plane to be a target of a copy **must** be specified separately using the `pRegions` member of the `VkBufferImageCopy` structure. In this case, the `aspectMask` of `imageSubresource` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`. For the purposes of `vkCmdCopyBufferToImage`, each plane of a multi-planar image is treated as having the format listed in [Compatible formats of planes of multi-planar formats](#) for the plane identified by the `aspectMask` of the corresponding subresource. This applies both to `VkFormat` and to coordinates used in the copy, which correspond to texels in the *plane* rather than how these texels map to coordinates in the image as a whole.

## Valid Usage

- `srcBuffer` **must** be large enough to contain all buffer locations that are accessed according to [Buffer and Image Addressing](#), for each element of `pRegions`
- The image region specified by each element of `pRegions` **must** be a region that is contained within `dstImage` if the `dstImage`'s `VkFormat` is not a [multi-planar format](#), and **must** be a region that is contained within the plane being copied to if the `dstImage`'s `VkFormat` is a multi-planar format
- The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory
- `srcBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag
- The [format features](#) of `dstImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.
- If `srcBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `dstImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag
- If `dstImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `dstImage` **must** have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`
- `dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`
- If `commandBuffer` is an unprotected command buffer, then `srcBuffer` **must** not be a protected buffer
- If `commandBuffer` is an unprotected command buffer, then `dstImage` **must** not be a protected image
- If `commandBuffer` is a protected command buffer, then `dstImage` **must** not be an unprotected image
- The `imageSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created
- The `imageSubresource.baseArrayLayer + imageSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created
- The `imageOffset` and `imageExtent` members of each element of `pRegions` **must** respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in [VkQueueFamilyProperties](#)
- `dstImage` **must** not have been created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `srcBuffer` **must** be a valid `VkBuffer` handle
- `dstImage` **must** be a valid `VkImage` handle
- `dstImageLayout` **must** be a valid `VkImageLayout` value
- `pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy` structures
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations
- This command **must** only be called outside of a render pass instance
- `regionCount` **must** be greater than `0`
- Each of `commandBuffer`, `dstImage`, and `srcBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Outside	Transfer Graphics Compute	Transfer

To copy data from an image object to a buffer object, call:

```
void vkCmdCopyImageToBuffer(  
    VkCommandBuffer  
    VkImage  
    VkImageLayout  
    VkBuffer  
    uint32_t  
    const VkBufferImageCopy*  
        commandBuffer,  
        srcImage,  
        srcImageLayout,  
        dstBuffer,  
        regionCount,  
        pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the copy.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferImageCopy` structures specifying the regions to copy.

Each region in `pRegions` is copied from the specified region of the source image to the specified region of the destination buffer.

If the `VkFormat` of `srcImage` is a [multi-planar image format](#), regions of each plane to be a source of a copy **must** be specified separately using the `pRegions` member of the `VkBufferImageCopy` structure. In this case, the `aspectMask` of `imageSubresource` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`. For the purposes of `vkCmdCopyBufferToImage`, each plane of a multi-planar image is treated as having the format listed in [Compatible formats of planes of multi-planar formats](#) for the plane identified by the `aspectMask` of the corresponding subresource. This applies both to `VkFormat` and to coordinates used in the copy, which correspond to texels in the *plane* rather than how these texels map to coordinates in the image as a whole.

## Valid Usage

- The image region specified by each element of `pRegions` **must** be a region that is contained within `srcImage` if the `srcImage`'s `VkFormat` is not a [multi-planar format](#), and **must** be a region that is contained within the plane being copied if the `srcImage`'s `VkFormat` is a multi-planar format
- `dstBuffer` **must** be large enough to contain all buffer locations that are accessed according to [Buffer and Image Addressing](#), for each element of `pRegions`
- The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory
- The [format features](#) of `srcImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`.
- `srcImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag
- If `srcImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `srcImage` **must** have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`
- `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- `srcImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`
- `dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag
- If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- If `commandBuffer` is an unprotected command buffer, then `srcImage` **must** not be a protected image
- If `commandBuffer` is an unprotected command buffer, then `dstBuffer` **must** not be a protected buffer
- If `commandBuffer` is a protected command buffer, then `dstBuffer` **must** not be an unprotected buffer
- The `imageSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created
- The `imageSubresource.baseArrayLayer + imageSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created
- The `imageOffset` and `imageExtent` members of each element of `pRegions` **must** respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`
- `srcImage` **must** not have been created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `srcImage` **must** be a valid `VkImage` handle
- `srcImageLayout` **must** be a valid `VkImageLayout` value
- `dstBuffer` **must** be a valid `VkBuffer` handle
- `pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy` structures
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations
- This command **must** only be called outside of a render pass instance
- `regionCount` **must** be greater than `0`
- Each of `commandBuffer`, `dstBuffer`, and `srcImage` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Outside	Transfer Graphics Compute	Transfer

For both `vkCmdCopyBufferToImage` and `vkCmdCopyImageToBuffer`, each element of `pRegions` is a structure defined as:

```

typedef struct VkBufferImageCopy {
    VkDeviceSize          bufferOffset;
    uint32_t              bufferRowLength;
    uint32_t              bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D            imageOffset;
    VkExtent3D            imageExtent;
} VkBufferImageCopy;

```

- **bufferOffset** is the offset in bytes from the start of the buffer object where the image data is copied from or to.
- **bufferRowLength** and **bufferImageHeight** specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the **imageExtent**.
- **imageSubresource** is a [VkImageSubresourceLayers](#) used to specify the specific image subresources of the image used for the source or destination image data.
- **imageOffset** selects the initial **x**, **y**, **z** offsets in texels of the sub-region of the source or destination image data.
- **imageExtent** is the size in texels of the image to copy in **width**, **height** and **depth**.

When copying to or from a depth or stencil aspect, the data in buffer memory uses a layout that is a (mostly) tightly packed representation of the depth or stencil data. Specifically:

- data copied to or from the stencil aspect of any depth/stencil format is tightly packed with one **VK\_FORMAT\_S8\_UINT** value per texel.
- data copied to or from the depth aspect of a **VK\_FORMAT\_D16\_UNORM** or **VK\_FORMAT\_D16\_UNORM\_S8\_UINT** format is tightly packed with one **VK\_FORMAT\_D16\_UNORM** value per texel.
- data copied to or from the depth aspect of a **VK\_FORMAT\_D32\_SFLOAT** or **VK\_FORMAT\_D32\_SFLOAT\_S8\_UINT** format is tightly packed with one **VK\_FORMAT\_D32\_SFLOAT** value per texel.
- data copied to or from the depth aspect of a **VK\_FORMAT\_X8\_D24\_UNORM\_PACK32** or **VK\_FORMAT\_D24\_UNORM\_S8\_UINT** format is packed with one 32-bit word per texel with the D24 value in the LSBs of the word, and undefined values in the eight MSBs.

#### *Note*

To copy both the depth and stencil aspects of a depth/stencil format, two entries in **pRegions** **can** be used, where one specifies the depth aspect in **imageSubresource**, and the other specifies the stencil aspect.

Because depth or stencil aspect buffer to image copies **may** require format conversions on some implementations, they are not supported on queues that do not support graphics.

When copying to a depth aspect, and the **VK\_EXT\_depth\_range\_unrestricted** extension is not enabled, the data in buffer memory **must** be in the range [0,1], or the resulting values are

undefined.

Copies are done layer by layer starting with image layer `baseArrayLayer` member of `imageSubresource`. `layerCount` layers are copied from the source image or to the destination image.

## Valid Usage

- If the calling command's `VkImage` parameter's format is not a depth/stencil format or a [multi-planar format](#), then `bufferOffset` **must** be a multiple of the format's texel block size.
- If the calling command's `VkImage` parameter's format is a [multi-planar format](#), then `bufferOffset` **must** be a multiple of the element size of the compatible format for the format and the `aspectMask` of the `imageSubresource` as defined in [Compatible formats of planes of multi-planar formats](#)
- `bufferOffset` **must** be a multiple of 4
- `bufferRowLength` **must** be 0, or greater than or equal to the `width` member of `imageExtent`
- `bufferImageHeight` **must** be 0, or greater than or equal to the `height` member of `imageExtent`
- `imageOffset.x` and (`imageExtent.width + imageOffset.x`) **must** both be greater than or equal to 0 and less than or equal to the image subresource width where this refers to the width of the *plane* of the image involved in the copy in the case of a [multi-planar format](#)
- `imageOffset.y` and (`imageExtent.height + imageOffset.y`) **must** both be greater than or equal to 0 and less than or equal to the image subresource height where this refers to the height of the *plane* of the image involved in the copy in the case of a [multi-planar format](#)
- If the calling command's `srcImage` (`vkCmdCopyImageToBuffer`) or `dstImage` (`vkCmdCopyBufferToImage`) is of type `VK_IMAGE_TYPE_1D`, then `imageOffset.y` **must** be 0 and `imageExtent.height` **must** be 1.
- `imageOffset.z` and (`imageExtent.depth + imageOffset.z`) **must** both be greater than or equal to 0 and less than or equal to the image subresource depth
- If the calling command's `srcImage` (`vkCmdCopyImageToBuffer`) or `dstImage` (`vkCmdCopyBufferToImage`) is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then `imageOffset.z` **must** be 0 and `imageExtent.depth` **must** be 1
- If the calling command's `VkImage` parameter is a compressed image, or a *single-plane, “\_422”* image format, `bufferRowLength` **must** be a multiple of the compressed texel block width
- If the calling command's `VkImage` parameter is a compressed image, or a *single-plane, “\_422”* image format, `bufferImageHeight` **must** be a multiple of the compressed texel block height
- If the calling command's `VkImage` parameter is a compressed image, or a *single-plane, “\_422”* image format, all members of `imageOffset` **must** be a multiple of the corresponding dimensions of the compressed texel block
- If the calling command's `VkImage` parameter is a compressed image, or a *single-plane, “\_422”* image format, `bufferOffset` **must** be a multiple of the compressed texel block size in bytes
- If the calling command's `VkImage` parameter is a compressed image, or a *single-plane, “\_422”* image format, `imageExtent.width` **must** be a multiple of the compressed texel block width or (`imageExtent.width + imageOffset.x`) **must** equal the image subresource width
- If the calling command's `VkImage` parameter is a compressed image, or a *single-plane, “\_422”* image format, `imageExtent.height` **must** be a multiple of the compressed texel block height or (`imageExtent.height + imageOffset.y`) **must** equal the image subresource height
- If the calling command's `VkImage` parameter is a compressed image, or a *single-plane, “\_422”* image format, `imageExtent.depth` **must** be a multiple of the compressed texel block depth or (`imageExtent.depth + imageOffset.z`) **must** equal the image subresource depth

`_422`" image format, `imageExtent.height` **must** be a multiple of the compressed texel block height or (`imageExtent.height + imageOffset.y`) **must** equal the image subresource height

- If the calling command's `VkImage` parameter is a compressed image, or a *single-plane*, “`_422`” image format, `imageExtent.depth` **must** be a multiple of the compressed texel block depth or (`imageExtent.depth + imageOffset.z`) **must** equal the image subresource depth
- The `aspectMask` member of `imageSubresource` **must** specify aspects present in the calling command's `VkImage` parameter
- If the calling command's `VkImage` parameter's format is a *multi-planar format*, then the `aspectMask` member of `imageSubresource` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT` (with `VK_IMAGE_ASPECT_PLANE_2_BIT` valid only for image formats with three planes)
- The `aspectMask` member of `imageSubresource` **must** only have a single bit set
- If the calling command's `VkImage` parameter is of `VkImageType VK_IMAGE_TYPE_3D`, the `baseArrayLayer` and `layerCount` members of `imageSubresource` **must** be `0` and `1`, respectively

### Valid Usage (Implicit)

- `imageSubresource` **must** be a valid `VkImageSubresourceLayers` structure

#### 19.4.1. Buffer and Image Addressing

Pseudocode for image/buffer addressing of uncompressed formats is:

```
rowLength = region->bufferRowLength;  
if (rowLength == 0)  
    rowLength = region->imageExtent.width;  
  
imageHeight = region->bufferImageHeight;  
if (imageHeight == 0)  
    imageHeight = region->imageExtent.height;  
  
texelBlockSize = <texel block size of the format of the src/dstImage>;  
  
address of (x,y,z) = region->bufferOffset + (((z * imageHeight) + y) * rowLength + x)  
* texelBlockSize;  
  
where x,y,z range from (0,0,0) to region->imageExtent.{width,height,depth}.
```

Note that `imageOffset` does not affect addressing calculations for buffer memory. Instead, `bufferOffset` can be used to select the starting address in buffer memory.

For block-compressed formats, all parameters are still specified in texels rather than compressed texel blocks, but the addressing math operates on whole compressed texel blocks. Pseudocode for compressed copy addressing is:

```

rowLength = region->bufferRowLength;
if (rowLength == 0)
    rowLength = region->imageExtent.width;

imageHeight = region->bufferImageHeight;
if (imageHeight == 0)
    imageHeight = region->imageExtent.height;

compressedTexelBlockSizeInBytes = <compressed texel block size taken from the src
/dstImage>;
rowLength /= compressedTexelBlockWidth;
imageHeight /= compressedTexelBlockHeight;

address of (x,y,z) = region->bufferOffset + (((z * imageHeight) + y) * rowLength + x)
* compressedTexelBlockSizeInBytes;

where x,y,z range from (0,0,0) to region->imageExtent.{width/
compressedTexelBlockWidth,height/compressedTexelBlockHeight,depth/compressedTexelBlock
Depth}.

```

Copying to or from block-compressed images is typically done in multiples of the compressed texel block size. For this reason the `imageExtent` **must** be a multiple of the compressed texel block dimension. There is one exception to this rule which is **required** to handle compressed images created with dimensions that are not a multiple of the compressed texel block dimensions:

- If `imageExtent.width` is not a multiple of the compressed texel block width, then `(imageExtent.width + imageOffset.x)` **must** equal the image subresource width.
- If `imageExtent.height` is not a multiple of the compressed texel block height, then `(imageExtent.height + imageOffset.y)` **must** equal the image subresource height.
- If `imageExtent.depth` is not a multiple of the compressed texel block depth, then `(imageExtent.depth + imageOffset.z)` **must** equal the image subresource depth.

This allows the last compressed texel block of the image in each non-multiple dimension to be included as a source or destination of the copy.

## 19.5. Image Copies with Scaling

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```

void vkCmdBlitImage(
    VkCommandBuffer
    VkImage
    VkImageLayout
    VkImage
    VkImageLayout
    uint32_t
    const VkImageBlit*
    VkFilter
        commandBuffer,
        srcImage,
        srcImageLayout,
        dstImage,
        dstImageLayout,
        regionCount,
        pRegions,
        filter);

```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the blit.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the blit.
- `regionCount` is the number of regions to blit.
- `pRegions` is a pointer to an array of `VkImageBlit` structures specifying the regions to blit.
- `filter` is a `VkFilter` specifying the filter to apply if the blits require scaling.

`vkCmdBlitImage` must not be used for multisampled source or destination images. Use `vkCmdResolveImage` for this purpose.

As the sizes of the source and destination extents **can** differ in any dimension, texels in the source extent are scaled and filtered to the destination extent. Scaling occurs via the following operations:

- For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in [unnormalized to integer conversion](#):

$$u_{\text{base}} = i + \frac{1}{2}$$

$$v_{\text{base}} = j + \frac{1}{2}$$

$$w_{\text{base}} = k + \frac{1}{2}$$

- These base coordinates are then offset by the first destination offset:

$$u_{\text{offset}} = u_{\text{base}} - x_{\text{dst0}}$$

$$v_{\text{offset}} = v_{\text{base}} - y_{\text{dst0}}$$

$$w_{\text{offset}} = w_{\text{base}} - z_{\text{dst0}}$$

$$a_{\text{offset}} = a - \text{baseArrayCount}_{\text{dst}}$$

- The scale is determined from the source and destination regions, and applied to the offset coordinates:

$$\text{scale\_u} = (\mathbf{x}_{\text{src1}} - \mathbf{x}_{\text{src0}}) / (\mathbf{x}_{\text{dst1}} - \mathbf{x}_{\text{dst0}})$$

$$\text{scale\_v} = (\mathbf{y}_{\text{src1}} - \mathbf{y}_{\text{src0}}) / (\mathbf{y}_{\text{dst1}} - \mathbf{y}_{\text{dst0}})$$

$$\text{scale\_w} = (\mathbf{z}_{\text{src1}} - \mathbf{z}_{\text{src0}}) / (\mathbf{z}_{\text{dst1}} - \mathbf{z}_{\text{dst0}})$$

$$\mathbf{u}_{\text{scaled}} = \mathbf{u}_{\text{offset}} * \text{scale}_u$$

$$\mathbf{v}_{\text{scaled}} = \mathbf{v}_{\text{offset}} * \text{scale}_v$$

$$\mathbf{w}_{\text{scaled}} = \mathbf{w}_{\text{offset}} * \text{scale}_w$$

- Finally the source offset is added to the scaled coordinates, to determine the final unnormalized coordinates used to sample from `srcImage`:

$$\mathbf{u} = \mathbf{u}_{\text{scaled}} + \mathbf{x}_{\text{src0}}$$

$$\mathbf{v} = \mathbf{v}_{\text{scaled}} + \mathbf{y}_{\text{src0}}$$

$$\mathbf{w} = \mathbf{w}_{\text{scaled}} + \mathbf{z}_{\text{src0}}$$

$$q = \text{mipLevel}$$

$$a = a_{\text{offset}} + \text{baseArrayCount}_{\text{src}}$$

These coordinates are used to sample from the source image, as described in [Image Operations chapter](#), with the filter mode equal to that of `filter`, a mipmap mode of `VK_SAMPLER_MIPMAP_MODE_NEAREST` and an address mode of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`. Implementations **must** clamp at the edge of the source image, and **may** additionally clamp to the edge of the source region.

*Note*

Due to allowable rounding errors in the generation of the source texture coordinates, it is not always possible to guarantee exactly which source texels will be sampled for a given blit. As rounding errors are implementation dependent, the exact results of a blitting operation are also implementation dependent.

Blits are done layer by layer starting with the `baseArrayLayer` member of `srcSubresource` for the source and `dstSubresource` for the destination. `layerCount` layers are blitted to the destination image.

3D textures are blitted slice by slice. Slices in the source region bounded by `srcOffsets[0].z` and `srcOffsets[1].z` are copied to slices in the destination region bounded by `dstOffsets[0].z` and `dstOffsets[1].z`. For each destination slice, a source z coordinate is linearly interpolated between `srcOffsets[0].z` and `srcOffsets[1].z`. If the `filter` parameter is `VK_FILTER_LINEAR` then the value

sampled from the source image is taken by doing linear filtering using the interpolated  $z$  coordinate. If `filter` parameter is `VK_FILTER_NEAREST` then the value sampled from the source image is taken from the single nearest slice, with an implementation-dependent arithmetic rounding mode.

The following filtering and conversion rules apply:

- Integer formats **can** only be converted to other integer formats with the same signedness.
- No format conversion is supported between depth/stencil images. The formats **must** match.
- Format conversions on unorm, snorm, unscaled and packed float formats of the copied aspect of the image are performed by first converting the pixels to float values.
- For sRGB source formats, nonlinear RGB values are converted to linear representation prior to filtering.
- After filtering, the float values are first clamped and then cast to the destination image format. In case of sRGB destination format, linear RGB values are converted to nonlinear representation before writing the pixel to the image.

Signed and unsigned integers are converted by first clamping to the representable range of the destination format, then casting the value.

## Valid Usage

- The source region specified by each element of `pRegions` **must** be a region that is contained within `srcImage`
- The destination region specified by each element of `pRegions` **must** be a region that is contained within `dstImage`
- The union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory with any texel that **may** be sampled during the blit operation
- The `format features` of `srcImage` **must** contain `VK_FORMAT_FEATURE_BLIT_SRC_BIT`.
- `srcImage` **must** not use a format listed in `Formats requiring sampler Y'CBCR conversion for VK_IMAGE_ASPECT_COLOR_BIT image views`
- `srcImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag
- If `srcImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- `srcImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`
- The `format features` of `dstImage` **must** contain `VK_FORMAT_FEATURE_BLIT_DST_BIT`.
- `dstImage` **must** not use a format listed in `Formats requiring sampler Y'CBCR conversion for VK_IMAGE_ASPECT_COLOR_BIT image views`
- `dstImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag
- If `dstImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`
- The sample count of `srcImage` and `dstImage` **must** both be equal to `VK_SAMPLE_COUNT_1_BIT`
- If either of `srcImage` or `dstImage` was created with a signed integer `VkFormat`, the other **must** also have been created with a signed integer `VkFormat`
- If either of `srcImage` or `dstImage` was created with an unsigned integer `VkFormat`, the other **must** also have been created with an unsigned integer `VkFormat`
- If either of `srcImage` or `dstImage` was created with a depth/stencil format, the other **must** have exactly the same format
- If `srcImage` was created with a depth/stencil format, `filter` **must** be `VK_FILTER_NEAREST`
- `srcImage` **must** have been created with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`
- `dstImage` **must** have been created with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`
- If `filter` is `VK_FILTER_LINEAR`, then the `format features` of `srcImage` **must** contain

`VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- If `filter` is `VK_FILTER_CUBIC_EXT`, then the `format` features of `srcImage` **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.
- If `filter` is `VK_FILTER_CUBIC_EXT`, `srcImage` **must** have a `VkImageType` of `VK_IMAGE_TYPE_2D`
- If `commandBuffer` is an unprotected command buffer, then `srcImage` **must** not be a protected image
- If `commandBuffer` is an unprotected command buffer, then `dstImage` **must** not be a protected image
- If `commandBuffer` is a protected command buffer, then `dstImage` **must** not be an unprotected image
- The `srcSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created
- The `dstSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created
- The `srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created
- The `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created
- `dstImage` and `srcImage` **must** not have been created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `srcImage` **must** be a valid `VkImage` handle
- `srcImageLayout` **must** be a valid `VkImageLayout` value
- `dstImage` **must** be a valid `VkImage` handle
- `dstImageLayout` **must** be a valid `VkImageLayout` value
- `pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkImageBlit` structures
- `filter` **must** be a valid `VkFilter` value
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called outside of a render pass instance
- `regionCount` **must** be greater than 0
- Each of `commandBuffer`, `dstImage`, and `srcImage` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Outside	Graphics	Transfer

The `VkImageBlit` structure is defined as:

```
typedef struct VkImageBlit {  
    VkImageSubresourceLayers    srcSubresource;  
    VkOffset3D                 srcOffsets[2];  
    VkImageSubresourceLayers    dstSubresource;  
    VkOffset3D                 dstOffsets[2];  
} VkImageBlit;
```

- `srcSubresource` is the subresource to blit from.
- `srcOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the source region within `srcSubresource`.
- `dstSubresource` is the subresource to blit into.
- `dstOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the destination region within `dstSubresource`.

For each element of the `pRegions` array, a blit operation is performed the specified source and destination regions.

## Valid Usage

- The `aspectMask` member of `srcSubresource` and `dstSubresource` **must** match
- The `layerCount` member of `srcSubresource` and `dstSubresource` **must** match
- If either of the calling command's `srcImage` or `dstImage` parameters are of `VkImageType VK_IMAGE_TYPE_3D`, the `baseArrayLayer` and `layerCount` members of both `srcSubresource` and `dstSubresource` **must** be `0` and `1`, respectively
- The `aspectMask` member of `srcSubresource` **must** specify aspects present in the calling command's `srcImage`
- The `aspectMask` member of `dstSubresource` **must** specify aspects present in the calling command's `dstImage`
- `srcOffset[0].x` and `srcOffset[1].x` **must** both be greater than or equal to `0` and less than or equal to the source image subresource width
- `srcOffset[0].y` and `srcOffset[1].y` **must** both be greater than or equal to `0` and less than or equal to the source image subresource height
- If the calling command's `srcImage` is of type `VK_IMAGE_TYPE_1D`, then `srcOffset[0].y` **must** be `0` and `srcOffset[1].y` **must** be `1`.
- `srcOffset[0].z` and `srcOffset[1].z` **must** both be greater than or equal to `0` and less than or equal to the source image subresource depth
- If the calling command's `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then `srcOffset[0].z` **must** be `0` and `srcOffset[1].z` **must** be `1`.
- `dstOffset[0].x` and `dstOffset[1].x` **must** both be greater than or equal to `0` and less than or equal to the destination image subresource width
- `dstOffset[0].y` and `dstOffset[1].y` **must** both be greater than or equal to `0` and less than or equal to the destination image subresource height
- If the calling command's `dstImage` is of type `VK_IMAGE_TYPE_1D`, then `dstOffset[0].y` **must** be `0` and `dstOffset[1].y` **must** be `1`.
- `dstOffset[0].z` and `dstOffset[1].z` **must** both be greater than or equal to `0` and less than or equal to the destination image subresource depth
- If the calling command's `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then `dstOffset[0].z` **must** be `0` and `dstOffset[1].z` **must** be `1`.

## Valid Usage (Implicit)

- `srcSubresource` **must** be a valid `VkImageSubresourceLayers` structure
- `dstSubresource` **must** be a valid `VkImageSubresourceLayers` structure

## 19.6. Resolving Multisample Images

To resolve a multisample image to a non-multisample image, call:

```
void vkCmdResolveImage(  
    VkCommandBuffer  
    VkImage  
    VkImageLayout  
    VkImage  
    VkImageLayout  
    uint32_t  
    const VkImageResolve*  
                                commandBuffer,  
                                srcImage,  
                                srcImageLayout,  
                                dstImage,  
                                dstImageLayout,  
                                regionCount,  
                                pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the resolve.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the resolve.
- `regionCount` is the number of regions to resolve.
- `pRegions` is a pointer to an array of `VkImageResolve` structures specifying the regions to resolve.

During the resolve the samples corresponding to each pixel location in the source are converted to a single sample before being written to the destination. If the source formats are floating-point or normalized types, the sample values for each pixel are resolved in an implementation-dependent manner. If the source formats are integer types, a single sample's value is selected for each pixel.

`srcOffset` and `dstOffset` select the initial `x`, `y`, and `z` offsets in texels of the sub-regions of the source and destination image data. `extent` is the size in texels of the source image to resolve in `width`, `height` and `depth`.

Resolves are done layer by layer starting with `baseArrayLayer` member of `srcSubresource` for the source and `dstSubresource` for the destination. `layerCount` layers are resolved to the destination image.

## Valid Usage

- The source region specified by each element of `pRegions` **must** be a region that is contained within `srcImage`
- The destination region specified by each element of `pRegions` **must** be a region that is contained within `dstImage`
- The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory
- If `srcImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `srcImage` **must** have a sample count equal to any valid sample count value other than `VK_SAMPLE_COUNT_1_BIT`
- If `dstImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `dstImage` **must** have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`
- `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- `srcImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`
- `dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
- `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`
- The `format features` of `dstImage` **must** contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`.
- `srcImage` and `dstImage` **must** have been created with the same image format
- If `commandBuffer` is an unprotected command buffer, then `srcImage` **must** not be a protected image
- If `commandBuffer` is an unprotected command buffer, then `dstImage` **must** not be a protected image
- If `commandBuffer` is a protected command buffer, then `dstImage` **must** not be an unprotected image
- The `srcSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created
- The `dstSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created
- The `srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created
- The `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo`

when `dstImage` was created

- `dstImage` and `srcImage` **must** not have been created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `srcImage` **must** be a valid `VkImage` handle
- `srcImageLayout` **must** be a valid `VkImageLayout` value
- `dstImage` **must** be a valid `VkImage` handle
- `dstImageLayout` **must** be a valid `VkImageLayout` value
- `pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkImageResolve` structures
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called outside of a render pass instance
- `regionCount` **must** be greater than `0`
- Each of `commandBuffer`, `dstImage`, and `srcImage` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Outside	Graphics	Transfer

The `VkImageResolve` structure is defined as:

```
typedef struct VkImageResolve {
    VkImageSubresourceLayers    srcSubresource;
    VkOffset3D                  srcOffset;
    VkImageSubresourceLayers    dstSubresource;
    VkOffset3D                  dstOffset;
    VkExtent3D                  extent;
} VkImageResolve;
```

- **srcSubresource** and **dstSubresource** are [VkImageSubresourceLayers](#) structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.
- **srcOffset** and **dstOffset** select the initial **x**, **y**, and **z** offsets in texels of the sub-regions of the source and destination image data.
- **extent** is the size in texels of the source image to resolve in **width**, **height** and **depth**.

## Valid Usage

- The `aspectMask` member of `srcSubresource` and `dstSubresource` **must** only contain `VK_IMAGE_ASPECT_COLOR_BIT`
- The `layerCount` member of `srcSubresource` and `dstSubresource` **must** match
- If either of the calling command's `srcImage` or `dstImage` parameters are of `VkImageType VK_IMAGE_TYPE_3D`, the `baseArrayLayer` and `layerCount` members of both `srcSubresource` and `dstSubresource` **must** be `0` and `1`, respectively
- `srcOffset.x` and `(extent.width + srcOffset.x)` **must** both be greater than or equal to `0` and less than or equal to the source image subresource width
- `srcOffset.y` and `(extent.height + srcOffset.y)` **must** both be greater than or equal to `0` and less than or equal to the source image subresource height
- If the calling command's `srcImage` is of type `VK_IMAGE_TYPE_1D`, then `srcOffset.y` **must** be `0` and `extent.height` **must** be `1`.
- `srcOffset.z` and `(extent.depth + srcOffset.z)` **must** both be greater than or equal to `0` and less than or equal to the source image subresource depth
- If the calling command's `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then `srcOffset.z` **must** be `0` and `extent.depth` **must** be `1`.
- `dstOffset.x` and `(extent.width + dstOffset.x)` **must** both be greater than or equal to `0` and less than or equal to the destination image subresource width
- `dstOffset.y` and `(extent.height + dstOffset.y)` **must** both be greater than or equal to `0` and less than or equal to the destination image subresource height
- If the calling command's `dstImage` is of type `VK_IMAGE_TYPE_1D`, then `dstOffset.y` **must** be `0` and `extent.height` **must** be `1`.
- `dstOffset.z` and `(extent.depth + dstOffset.z)` **must** both be greater than or equal to `0` and less than or equal to the destination image subresource depth
- If the calling command's `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then `dstOffset.z` **must** be `0` and `extent.depth` **must** be `1`.

## Valid Usage (Implicit)

- `srcSubresource` **must** be a valid `VkImageSubresourceLayers` structure
- `dstSubresource` **must** be a valid `VkImageSubresourceLayers` structure

## 19.7. Buffer Markers

To write a 32-bit marker value into a buffer as a pipelined operation, call:

```
void vkCmdWriteBufferMarkerAMD(  
    VkCommandBuffer  
    VkPipelineStageFlagBits  
    VkBuffer  
    VkDeviceSize  
    uint32_t  
                                commandBuffer,  
                                pipelineStage,  
                                dstBuffer,  
                                dstOffset,  
                                marker);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineStage` is one of the `VkPipelineStageFlagBits` values, specifying the pipeline stage whose completion triggers the marker write.
- `dstBuffer` is the buffer where the marker will be written to.
- `dstOffset` is the byte offset into the buffer where the marker will be written to.
- `marker` is the 32-bit value of the marker.

The command will write the 32-bit marker value into the buffer only after all preceding commands have finished executing up to at least the specified pipeline stage. This includes the completion of other preceding `vkCmdWriteBufferMarkerAMD` commands so long as their specified pipeline stages occur either at the same time or earlier than this command's specified `pipelineStage`.

While consecutive buffer marker writes with the same `pipelineStage` parameter are implicitly complete in submission order, memory and execution dependencies between buffer marker writes and other operations must still be explicitly ordered using synchronization commands. The access scope for buffer marker writes falls under the `VK_ACCESS_TRANSFER_WRITE_BIT`, and the pipeline stages for identifying the synchronization scope **must** include both `pipelineStage` and `VK_PIPELINE_STAGE_TRANSFER_BIT`.

*Note*

Similar to `vkCmdWriteTimestamp`, if an implementation is unable to write a marker at any specific pipeline stage, it **may** instead do so at any logically later stage.

*Note*

Implementations **may** only support a limited number of pipelined marker write operations in flight at a given time, thus excessive number of marker write operations **may** degrade command execution performance.

## Valid Usage

- `dstOffset` **must** be less than or equal to the size of `dstBuffer` minus 4.
- `dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag
- If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `dstOffset` **must** be a multiple of 4

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `pipelineStage` **must** be a valid `VkPipelineStageFlagBits` value
- `dstBuffer` **must** be a valid `VkBuffer` handle
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations
- Both of `commandBuffer`, and `dstBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Transfer Graphics Compute	Transfer

# Chapter 20. Drawing Commands

*Drawing commands* (commands with `Draw` in the name) provoke work in a graphics pipeline. Drawing commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound graphics pipeline. A graphics pipeline **must** be bound to a command buffer before any drawing commands are recorded in that command buffer.

Drawing can be achieved in two modes:

- [Programmable Mesh Shading](#), the mesh shader assembles primitives, or
- [Programmable Primitive Shading](#), the input primitives are assembled

as follows.

Each draw is made up of zero or more vertices and zero or more instances, which are processed by the device and result in the assembly of primitives. Primitives are assembled according to the `pInputAssemblyState` member of the `VkGraphicsPipelineCreateInfo` structure, which is of type `VkPipelineInputAssemblyStateCreateInfo`:

```
typedef struct VkPipelineInputAssemblyStateCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineInputAssemblyStateCreateFlags   flags;
    VkPrimitiveTopology        topology;
    VkBool32                  primitiveRestartEnable;
} VkPipelineInputAssemblyStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to an extension-specific structure.
- `flags` is reserved for future use.
- `topology` is a [VkPrimitiveTopology](#) defining the primitive topology, as described below.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. This enable only applies to indexed draws (`vkCmdDrawIndexed` and `vkCmdDrawIndexedIndirect`), and the special index value is either `0xFFFFFFFF` when the `indexType` parameter of `vkCmdBindIndexBuffer` is equal to `VK_INDEX_TYPE_UINT32`, `0xFF` when `indexType` is equal to `VK_INDEX_TYPE_UINT8_EXT`, or `0xFFFF` when `indexType` is equal to `VK_INDEX_TYPE_UINT16`. Primitive restart is not allowed for “list” topologies.

Restarting the assembly of primitives discards the most recent index values if those elements formed an incomplete primitive, and restarts the primitive assembly using the subsequent indices, but only assembling the immediately following element through the end of the originally specified elements. The primitive restart index value comparison is performed before adding the `vertexOffset` value to the index value.

## Valid Usage

- If `topology` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, `primitiveRestartEnable` **must** be `VK_FALSE`
- If the `geometry shaders` feature is not enabled, `topology` **must** not be any of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`
- If the `tessellation shaders` feature is not enabled, `topology` **must** not be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`

## Valid Usage (Implicit)

- `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO`
- `pNext` **must** be `NULL`
- `flags` **must** be `0`
- `topology` **must** be a valid `VkPrimitiveTopology` value

```
typedef VkFlags VkPipelineInputAssemblyStateCreateFlags;
```

`VkPipelineInputAssemblyStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

## 20.1. Primitive Topologies

*Primitive topology* determines how consecutive vertices are organized into primitives, and determines the type of primitive that is used at the beginning of the graphics pipeline. The effective topology for later stages of the pipeline is altered by tessellation or geometry shading (if either is in use) and depends on the execution modes of those shaders. In the case of mesh shading the only effective topology is defined by the execution mode of the mesh shader.

The primitive topologies defined by `VkPrimitiveTopology` are:

```

typedef enum VkPrimitiveTopology {
    VK_PRIMITIVE_TOPOLOGY_POINT_LIST = 0,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST = 1,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP = 2,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST = 3,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP = 4,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN = 5,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY = 6,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY = 7,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY = 8,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY = 9,
    VK_PRIMITIVE_TOPOLOGY_PATCH_LIST = 10,
    VK_PRIMITIVE_TOPOLOGY_MAX_ENUM = 0x7FFFFFFF
} VkPrimitiveTopology;

```

- **VK\_PRIMITIVE\_TOPOLOGY\_POINT\_LIST** specifies a series of **separate point primitives**.
- **VK\_PRIMITIVE\_TOPOLOGY\_LINE\_LIST** specifies a series of **separate line primitives**.
- **VK\_PRIMITIVE\_TOPOLOGY\_LINE\_STRIP** specifies a series of **connected line primitives** with consecutive lines sharing a vertex.
- **VK\_PRIMITIVE\_TOPOLOGY\_TRIANGLE\_LIST** specifies a series of **separate triangle primitives**.
- **VK\_PRIMITIVE\_TOPOLOGY\_TRIANGLE\_STRIP** specifies a series of **connected triangle primitives** with consecutive triangles sharing an edge.
- **VK\_PRIMITIVE\_TOPOLOGY\_TRIANGLE\_FAN** specifies a series of **connected triangle primitives** with all triangles sharing a common vertex.
- **VK\_PRIMITIVE\_TOPOLOGY\_LINE\_LIST\_WITH\_ADJACENCY** specifies a series of **separate line primitives with adjacency**.
- **VK\_PRIMITIVE\_TOPOLOGY\_LINE\_STRIP\_WITH\_ADJACENCY** specifies a series of **connected line primitives with adjacency**, with consecutive primitives sharing three vertices.
- **VK\_PRIMITIVE\_TOPOLOGY\_TRIANGLE\_LIST\_WITH\_ADJACENCY** specifies a series of **separate triangle primitives with adjacency**.
- **VK\_PRIMITIVE\_TOPOLOGY\_TRIANGLE\_STRIP\_WITH\_ADJACENCY** specifies **connected triangle primitives with adjacency**, with consecutive triangles sharing an edge.
- **VK\_PRIMITIVE\_TOPOLOGY\_PATCH\_LIST** specifies **separate patch primitives**.

Each primitive topology, and its construction from a list of vertices, is described in detail below with a supporting diagram, according to the following key:

●	Vertex	A point in 3-dimensional space. Positions chosen within the diagrams are arbitrary and for illustration only.
5	Vertex Number	Sequence position of a vertex within the provided vertex data.
→	Provoking Vertex	Provoking vertex within the main primitive. The arrow points along an edge of the relevant primitive, following winding order. Used in <b>flat shading</b> .

	Primitive Edge	An edge connecting the points of a main primitive.
	Adjacency Edge	Points connected by these lines do not contribute to a main primitive, and are only accessible in a <a href="#">geometry shader</a> .
	Winding Order	The relative order in which vertices are defined within a primitive, used in the <a href="#">facing determination</a> . This ordering has no specific start or end point.

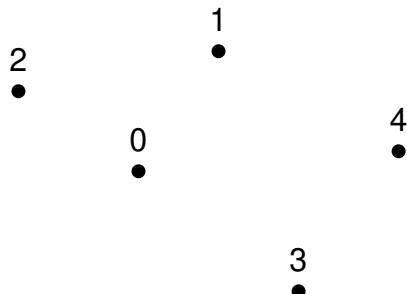

The diagrams are supported with mathematical definitions where the vertices ( $v$ ) and primitives ( $p$ ) are numbered starting from 0;  $v_0$  is the first vertex in the provided data and  $p_0$  is the first primitive in the set of primitives defined by the vertices and topology.

## 20.1.1. Point Lists

When the topology is [VK\\_PRIMITIVE\\_TOPOLOGY\\_POINT\\_LIST](#), each consecutive vertex defines a single point primitive, according to the equation:

$$p_i = \{v_i\}$$

As there is only one vertex, that vertex is the provoking vertex. The number of primitives generated is equal to [vertexCount](#).

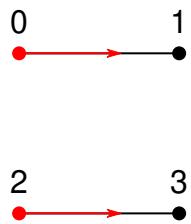

## 20.1.2. Line Lists

When the [topology](#) is [VK\\_PRIMITIVE\\_TOPOLOGY\\_LINE\\_LIST](#), each consecutive pair of vertices defines a single line primitive, according to the equation:

$$p_i = \{v_{2i}, v_{2i+1}\}$$

The provoking vertex for  $p_i$  is  $v_{2i}$ . The number of primitives generated is equal to [vertexCount/2](#).

### 20.1.3. Line Strips

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, one line primitive is defined by each vertex and the following vertex, according to the equation:

$$p_i = \{v_i, v_{i+1}\}$$

The provoking vertex for  $p_i$  is  $v_i$ . The number of primitives generated is equal to  $\max(0, \text{vertexCount} - 1)$ .

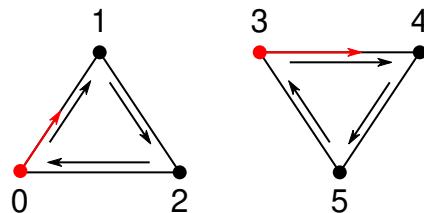

### 20.1.4. Triangle Lists

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, each consecutive set of three vertices defines a single triangle primitive, according to the equation:

$$p_i = \{v_{3i}, v_{3i+1}, v_{3i+2}\}$$

The provoking vertex for  $p_i$  is  $v_{3i}$ . The number of primitives generated is equal to  $\text{vertexCount}/3$ .

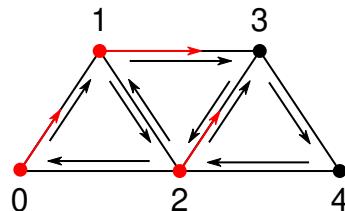

### 20.1.5. Triangle Strips

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, one triangle primitive is defined by each vertex and the two vertices that follow it, according to the equation:

$$p_i = \{v_i, v_{i+(1+i\%2)}, v_{i+(2-i\%2)}\}$$

The provoking vertex for  $p_i$  is  $v_i$ . The number of primitives generated is equal to  $\max(0, \text{vertexCount} - 2)$ .

*Note*

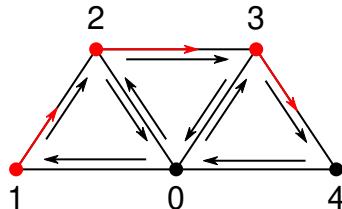

The ordering of the vertices in each successive triangle is reversed, so that the winding order is consistent throughout the strip.

## 20.1.6. Triangle Fans

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`, triangle primitives are defined around a shared common vertex, according to the equation:

$$p_i = \{v_{i+1}, v_{i+2}, v_0\}$$

The provoking vertex for  $p_i$  is  $v_{i+1}$ . The number of primitives generated is equal to  $\max(0, \text{vertexCount}-2)$ .

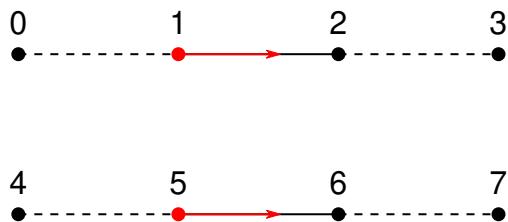

## 20.1.7. Line Lists With Adjacency

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, each consecutive set of four vertices defines a single line primitive with adjacency, according to the equation:

$$p_i = \{v_{4i}, v_{4i+1}, v_{4i+2}, v_{4i+3}\}$$

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a `geometry shader`.

The provoking vertex for  $p_i$  is  $v_{4i+1}$ . The number of primitives generated is equal to `vertexCount/4`.

## 20.1.8. Line Strips With Adjacency

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`, one line primitive with adjacency is defined by each vertex and the following vertex, according to the equation:

$$p_i = \{v_i, v_{i+1}, v_{i+2}, v_{i+3}\}$$

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a `geometry shader`.

The provoking vertex for  $p_i$  is  $v_{i+1}$ . The number of primitives generated is equal to  $\max(0, \text{vertexCount}-3)$ .

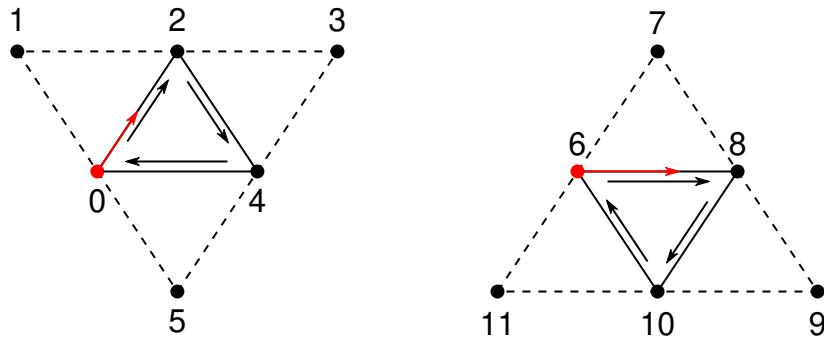

## 20.1.9. Triangle Lists With Adjacency

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, each consecutive set of six vertices defines a single triangle primitive with adjacency, according to the equations:

$$p_i = \{v_{6i}, v_{6i+1}, v_{6i+2}, v_{6i+3}, v_{6i+4}, v_{6i+5}\}$$

A triangle primitive is described by the first, third, and fifth vertices of the total primitive, with the remaining three vertices only accessible in a [geometry shader](#).

The provoking vertex for  $p_i$  is  $v_{6i}$ . The number of primitives generated is equal to `vertexCount/6` .

## 20.1.10. Triangle Strips With Adjacency

When the `topology` is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`, one triangle primitive with adjacency is defined by each vertex and the following 5 vertices.

The number of primitives generated,  $n$ , is equal to `max(0, vertexCount - 4)/2` .

If  $n=1$ , the primitive is defined as:

$$p_i = \{v_0, v_1, v_2, v_5, v_4, v_3\}$$

If  $n>1$ , the total primitive consists of different vertices according to where it is in the strip:

$$p_i = \{v_{2i}, v_{2i+1}, v_{2i+2}, v_{2i+6}, v_{2i+4}, v_{2i+3}\} \text{ when } i=0$$

$$p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+6}, v_{2i+2}, v_{2i+1}\} \text{ when } i>0, i<n-1, \text{ and } i \% 2 = 1$$

$$p_i = \{v_{2i}, v_{2i-2}, v_{2i+2}, v_{2i+6}, v_{2i+4}, v_{2i+3}\} \text{ when } i>0, i<n-1, \text{ and } i \% 2 = 0$$

$$p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+5}, v_{2i+2}, v_{2i-2}\} \text{ when } i=n-1 \text{ and } i \% 2 = 1$$

$$p_i = \{v_{2i}, v_{2i-2}, v_{2i+2}, v_{2i+5}, v_{2i+4}, v_{2i+3}\} \text{ when } i=n-1 \text{ and } i \% 2 = 0$$

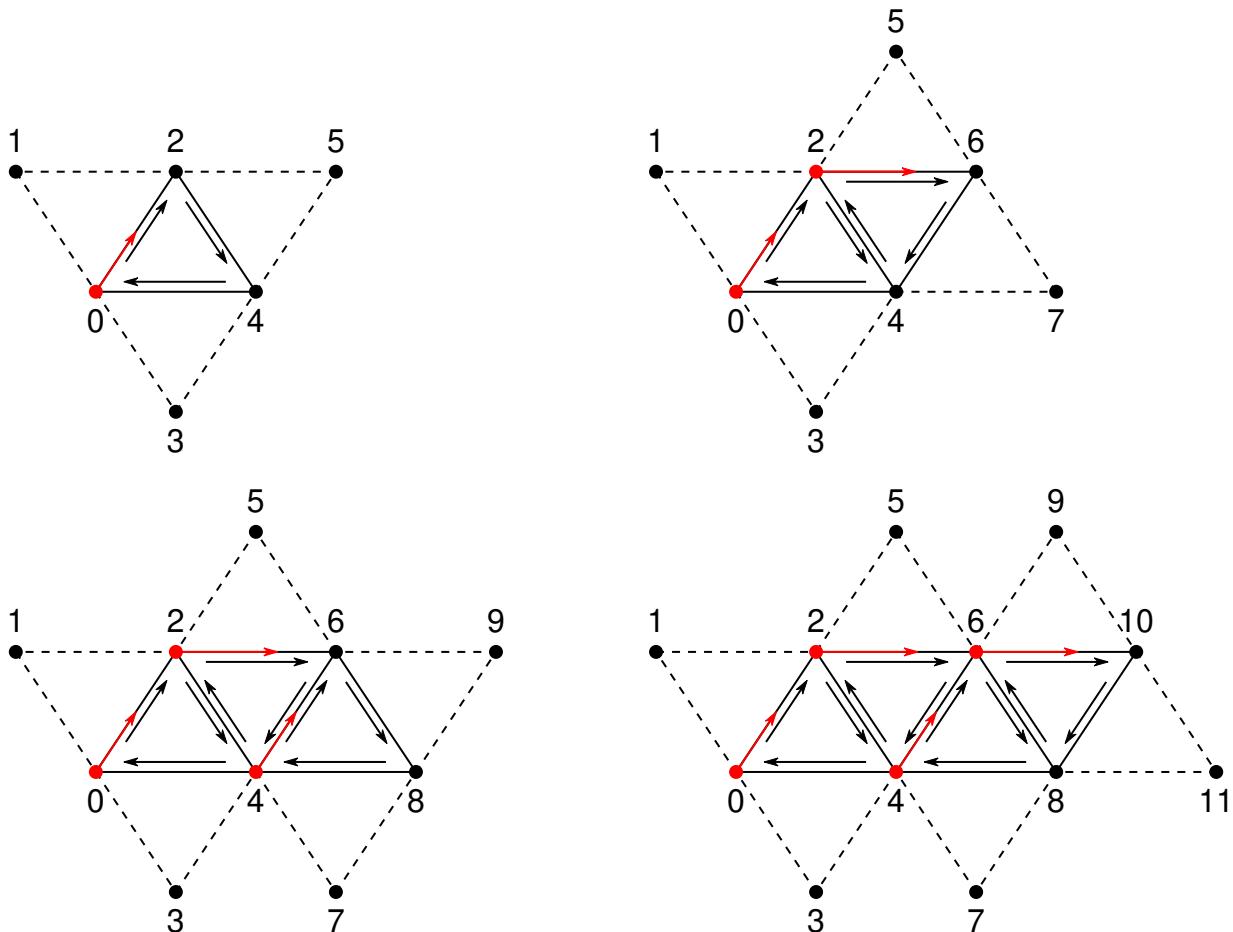

A triangle primitive is described by the first, third, and fifth vertices of the total primitive in all cases, with the remaining three vertices only accessible in a [geometry shader](#).

### Note

The ordering of the vertices in each successive triangle is altered so that the winding order is consistent throughout the strip.

The provoking vertex for  $p_i$  is always  $v_{2i}$ .

### 20.1.11. Patch Lists

When the [topology](#) is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, each consecutive set of  $m$  vertices defines a single patch primitive, according to the equation:

$$p_i = \{v_{mi}, v_{mi+1}, \dots, v_{mi+(m-2)}, v_{mi+(m-1)}\}$$

where  $m$  is equal to [`VkPipelineTessellationStateCreateInfo::patchControlPoints`](#).

Patch lists are never passed to [vertex post-processing](#), and as such no provoking vertex is defined for patch primitives. The number of primitives generated is equal to  $\text{vertexCount}/m$  .

The vertices comprising a patch have no implied geometry, and are used as inputs to tessellation shaders and the fixed-function tessellator to generate new point, line, or triangle primitives.

## 20.2. Primitive Order

Primitives generated by [drawing commands](#) progress through the stages of the [graphics pipeline](#) in *primitive order*. Primitive order is initially determined in the following way:

1. Submission order determines the initial ordering
2. For indirect draw commands, the order in which accessed instances of the `VkDrawIndirectCommand` are stored in `buffer`, from lower indirect buffer addresses to higher addresses.
3. If a draw command includes multiple instances, the order in which instances are executed, from lower numbered instances to higher.
4. The order in which primitives are specified by a draw command:
  - For non-indexed draws, from vertices with a lower numbered `vertexIndex` to a higher numbered `vertexIndex`.
  - For indexed draws, vertices sourced from a lower index buffer addresses to higher addresses.
  - For draws using mesh shaders, the order is provided by `mesh shading`.

Within this order implementations further sort primitives:

5. If tessellation shading is active, by an implementation-dependent order of new primitives generated by `tessellation`.
6. If geometry shading is active, by the order new primitives are generated by `geometry shading`.
7. If the `polygon mode` is not `VK_POLYGON_MODE_FILL`, or `VK_POLYGON_MODE_FILL_RECTANGLE_NV`, by an implementation-dependent ordering of the new primitives generated within the original primitive.

Primitive order is later used to define `rasterization order`, which determines the order in which fragments output results to a framebuffer.

## 20.3. Programmable Primitive Shading

Once primitives are assembled, they proceed to the vertex shading stage of the pipeline. If the draw includes multiple instances, then the set of primitives is sent to the vertex shading stage multiple times, once for each instance.

It is implementation-dependent whether vertex shading occurs on vertices that are discarded as part of incomplete primitives, but if it does occur then it operates as if they were vertices in complete primitives and such invocations **can** have side effects.

Vertex shading receives two per-vertex inputs from the primitive assembly stage - the `vertexIndex` and the `instanceIndex`. How these values are generated is defined below, with each command.

Drawing commands fall roughly into two categories:

- Non-indexed drawing commands present a sequential `vertexIndex` to the vertex shader. The sequential index is generated automatically by the device (see [Fixed-Function Vertex Processing](#) for details on both specifying the vertex attributes indexed by `vertexIndex`, as well as binding vertex buffers containing those attributes to a command buffer). These commands are:
  - `vkCmdDraw`

- `vkCmdDrawIndirect`
- `vkCmdDrawIndirectCountKHR`
- `vkCmdDrawIndirectCountAMD`
- Indexed drawing commands read index values from an *index buffer* and use this to compute the `vertexIndex` value for the vertex shader. These commands are:
  - `vkCmdDrawIndexed`
  - `vkCmdDrawIndexedIndirect`
  - `vkCmdDrawIndexedIndirectCountKHR`
  - `vkCmdDrawIndexedIndirectCountAMD`

To bind an index buffer to a command buffer, call:

```
void vkCmdBindIndexBuffer(
    VkCommandBuffer           commandBuffer,
    VkBuffer                  buffer,
    VkDeviceSize              offset,
    VkIndexType               indexType);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer being bound.
- `offset` is the starting offset in bytes within `buffer` used in index buffer address calculations.
- `indexType` is a `VkIndexType` value specifying whether indices are treated as 16 bits or 32 bits.

## Valid Usage

- `offset` **must** be less than the size of `buffer`
- The sum of `offset` and the address of the range of `VkDeviceMemory` object that is backing `buffer`, **must** be a multiple of the type indicated by `indexType`
- `buffer` **must** have been created with the `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` flag
- If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `indexType` **must** not be `VK_INDEX_TYPE_NONE_NV`.
- If `indexType` is `VK_INDEX_TYPE_UINT8_EXT`, the `indexTypeUint8` feature **must** be enabled

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `buffer` **must** be a valid `VkBuffer` handle
- `indexType` **must** be a valid `VkIndexType` value
- `commandBuffer` **must** be in the `recording state`
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- Both of `buffer`, and `commandBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Both	Graphics	

Possible values of `vkCmdBindIndexBuffer::indexType`, specifying the size of indices, are:

```
typedef enum VkIndexType {
    VK_INDEX_TYPE_UINT16 = 0,
    VK_INDEX_TYPE_UINT32 = 1,
    VK_INDEX_TYPE_NONE_NV = 1000165000,
    VK_INDEX_TYPE_UINT8_EXT = 1000265000,
    VK_INDEX_TYPE_MAX_ENUM = 0x7FFFFFFF
} VkIndexType;
```

- `VK_INDEX_TYPE_UINT16` specifies that indices are 16-bit unsigned integer values.
- `VK_INDEX_TYPE_UINT32` specifies that indices are 32-bit unsigned integer values.
- `VK_INDEX_TYPE_NONE_NV` specifies that no indices are provided.
- `VK_INDEX_TYPE_UINT8_EXT` specifies that indices are 8-bit unsigned integer values.

The parameters for each drawing command are specified directly in the command or read from

buffer memory, depending on the command. Drawing commands that source their parameters from buffer memory are known as *indirect* drawing commands.

All drawing commands interact with the [Robust Buffer Access](#) feature.

To record a non-indexed draw, call:

```
void vkCmdDraw(  
    VkCommandBuffer  
    uint32_t  
    uint32_t  
    uint32_t  
    uint32_t  
    uint32_t  
        commandBuffer,  
        vertexCount,  
        instanceCount,  
        firstVertex,  
        firstInstance);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `vertexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstVertex` is the index of the first vertex to draw.
- `firstInstance` is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and `vertexCount` consecutive vertex indices with the first `vertexIndex` value equal to `firstVertex`. The primitives are drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

## Valid Usage

- If a `VkImageView` is sampled with `VK_FILTER_LINEAR` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN_EXT` or `VK_SAMPLER_REDUCTION_MODE_MAX_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.
- For each set  $n$  that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to  $n$  at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set  $n$ , with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)
- For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)
- Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command
- A valid pipeline **must** be bound to the pipeline bind point used by this command
- If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set for `commandBuffer`
- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage
- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a

`VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage
- If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- If `commandBuffer` is an unprotected command buffer, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be a protected resource
- The current render pass **must** be `compatible` with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.
- The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.
- Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set
- Image subresources used as attachments in the current render pass **must** not be accessed in any way other than as an attachment by this command.
- If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.
- If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set
- If `commandBuffer` is a protected command buffer, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be an unprotected resource
- If `commandBuffer` is a protected command buffer, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point **must** not write to any resource
- All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have valid buffers bound

- For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called inside of a render pass instance

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Inside	Graphics	Graphics

To record an indexed draw, call:

```
void vkCmdDrawIndexed(
    VkCommandBuffer
    uint32_t
    uint32_t
    uint32_t
    int32_t
    uint32_t
        commandBuffer,
        indexCount,
        instanceCount,
        firstIndex,
        vertexOffset,
        firstInstance);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
- `firstInstance` is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and `indexCount` vertices whose indices are retrieved from the index buffer. The index buffer is treated as an array of tightly packed unsigned integers of size defined by the `vkCmdBindIndexBuffer` ::`indexType` parameter with which the buffer was bound.

The first vertex index is at an offset of `firstIndex * indexSize + offset` within the bound index buffer, where `offset` is the offset specified by `vkCmdBindIndexBuffer` and `indexSize` is the byte size of the type specified by `indexType`. Subsequent index values are retrieved from consecutive locations in the index buffer. Indices are first compared to the primitive restart value, then zero extended to 32 bits (if the `indexType` is `VK_INDEX_TYPE_UINT8_EXT` or `VK_INDEX_TYPE_UINT16`) and have `vertexOffset` added to them, before being supplied as the `vertexIndex` value.

The primitives are drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

## Valid Usage

- If a `VkImageView` is sampled with `VK_FILTER_LINEAR` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN_EXT` or `VK_SAMPLER_REDUCTION_MODE_MAX_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.
- For each set  $n$  that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to  $n$  at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set  $n$ , with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)
- For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)
- Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command
- A valid pipeline **must** be bound to the pipeline bind point used by this command
- If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set for `commandBuffer`
- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage
- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a

`VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage
- If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- If `commandBuffer` is an unprotected command buffer, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be a protected resource
- The current render pass **must** be `compatible` with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.
- The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.
- Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set
- Image subresources used as attachments in the current render pass **must** not be accessed in any way other than as an attachment by this command.
- If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.
- If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set
- If `commandBuffer` is a protected command buffer, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be an unprotected resource
- If `commandBuffer` is a protected command buffer, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point **must** not write to any resource
- All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have valid buffers bound

- For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)
- $(\text{indexSize} * (\text{firstIndex} + \text{indexCount}) + \text{offset})$  **must** be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `commandBuffer` **must** be in the [recording state](#)
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called inside of a render pass instance

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary	Inside	Graphics	Graphics
Secondary			

To record a non-indexed indirect draw, call:

```
void vkCmdDrawIndirect(
    VkCommandBuffer
    VkBuffer
    VkDeviceSize
    uint32_t
    uint32_t
        commandBuffer,
        buffer,
        offset,
        drawCount,
        stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and **can** be zero.

- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirect` behaves similarly to `vkCmdDraw` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndirectCommand` structures. If `drawCount` is less than or equal to one, `stride` is ignored.

## Valid Usage

- If a `VkImageView` is sampled with `VK_FILTER_LINEAR` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN_EXT` or `VK_SAMPLER_REDUCTION_MODE_MAX_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.
- For each set  $n$  that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to  $n$  at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set  $n$ , with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)
- For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)
- Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command
- A valid pipeline **must** be bound to the pipeline bind point used by this command
- If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set for `commandBuffer`
- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage
- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a

`VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage
- If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- If `commandBuffer` is an unprotected command buffer, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be a protected resource
- The current render pass **must** be `compatible` with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.
- The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.
- Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set
- Image subresources used as attachments in the current render pass **must** not be accessed in any way other than as an attachment by this command.
- If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.
- If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set
- All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have valid buffers bound
- For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)
- If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `buffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- `offset` **must** be a multiple of 4
- `commandBuffer` **must** not be a protected command buffer
- If the `multi-draw indirect` feature is not enabled, `drawCount` **must** be 0 or 1
- `drawCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`
- If the `drawIndirectFirstInstance` feature is not enabled, all the `firstInstance` members of the `VkDrawIndirectCommand` structures accessed by this command **must** be 0
- If `drawCount` is greater than 1, `stride` **must** be a multiple of 4 and **must** be greater than or equal to `sizeof(VkDrawIndirectCommand)`
- If `drawCount` is equal to 1, `(offset + sizeof(VkDrawIndirectCommand))` **must** be less than or equal to the size of `buffer`
- If `drawCount` is greater than 1, `(stride × (drawCount - 1) + offset + sizeof(VkDrawIndirectCommand))` **must** be less than or equal to the size of `buffer`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `buffer` **must** be a valid `VkBuffer` handle
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called inside of a render pass instance
- Both of `buffer`, and `commandBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Inside	Graphics	Graphics

The `VkDrawIndirectCommand` structure is defined as:

```
typedef struct VkDrawIndirectCommand {  
    uint32_t    vertexCount;  
    uint32_t    instanceCount;  
    uint32_t    firstVertex;  
    uint32_t    firstInstance;  
} VkDrawIndirectCommand;
```

- `vertexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstVertex` is the index of the first vertex to draw.
- `firstInstance` is the instance ID of the first instance to draw.

The members of `VkDrawIndirectCommand` have the same meaning as the similarly named parameters of `vkCmdDraw`.

## Valid Usage

- For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)
- If the `drawIndirectFirstInstance` feature is not enabled, `firstInstance` **must** be `0`

To record a non-indexed draw call with a draw call count sourced from a buffer, call:

```
void vkCmdDrawIndirectCountKHR(  
    VkCommandBuffer  
    VkBuffer  
    VkDeviceSize  
    VkBuffer  
    VkDeviceSize  
    uint32_t  
    uint32_t  
        commandBuffer,  
        buffer,  
        offset,  
        countBuffer,  
        countBufferOffset,  
        maxDrawCount,  
        stride);
```

or the equivalent command

```
void vkCmdDrawIndirectCountAMD(  
    VkCommandBuffer  
    VkBuffer  
    VkDeviceSize  
    VkBuffer  
    VkDeviceSize  
    uint32_t  
    uint32_t  
        commandBuffer,  
        buffer,  
        offset,  
        countBuffer,  
        countBufferOffset,  
        maxDrawCount,  
        stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.

- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `countBuffer` is the buffer containing the draw count.
- `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
- `maxDrawCount` specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirectCountKHR` behaves similarly to `vkCmdDrawIndirect` except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.

## Valid Usage

- If a `VkImageView` is sampled with `VK_FILTER_LINEAR` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN_EXT` or `VK_SAMPLER_REDUCTION_MODE_MAX_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.
- For each set  $n$  that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to  $n$  at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set  $n$ , with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)
- For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)
- Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command
- A valid pipeline **must** be bound to the pipeline bind point used by this command
- If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set for `commandBuffer`
- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage
- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a

`VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage
- If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- If `commandBuffer` is an unprotected command buffer, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be a protected resource
- The current render pass **must** be `compatible` with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.
- The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.
- Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set
- Image subresources used as attachments in the current render pass **must** not be accessed in any way other than as an attachment by this command.
- If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.
- If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set
- All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have valid buffers bound
- For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)
- If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `buffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- `offset` **must** be a multiple of 4
- `commandBuffer` **must** not be a protected command buffer
- If `countBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `countBuffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set
- `countBufferOffset` **must** be a multiple of 4
- The count stored in `countBuffer` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`
- `stride` **must** be a multiple of 4 and **must** be greater than or equal to `sizeof(VkDrawIndirectCommand)`
- If `maxDrawCount` is greater than or equal to 1,  $(\text{stride} \times (\text{maxDrawCount} - 1) + \text{offset} + \text{sizeof}(\text{VkDrawIndirectCommand}))$  **must** be less than or equal to the size of `buffer`
- If the count stored in `countBuffer` is equal to 1,  $(\text{offset} + \text{sizeof}(\text{VkDrawIndirectCommand}))$  **must** be less than or equal to the size of `buffer`
- If the count stored in `countBuffer` is greater than 1,  $(\text{stride} \times (\text{drawCount} - 1) + \text{offset} + \text{sizeof}(\text{VkDrawIndirectCommand}))$  **must** be less than or equal to the size of `buffer`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `buffer` **must** be a valid `VkBuffer` handle
- `countBuffer` **must** be a valid `VkBuffer` handle
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called inside of a render pass instance
- Each of `buffer`, `commandBuffer`, and `countBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Inside	Graphics	Graphics

To record an indexed indirect draw, call:

```
void vkCmdDrawIndexedIndirect(  
    VkCommandBuffer  
    VkBuffer  
    VkDeviceSize  
    uint32_t  
    uint32_t  
                                commandBuffer,  
                                buffer,  
                                offset,  
                                drawCount,  
                                stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and `can` be zero.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndexedIndirect` behaves similarly to `vkCmdDrawIndexed` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndexedIndirectCommand` structures. If `drawCount` is less than or equal to one, `stride` is ignored.

## Valid Usage

- If a `VkImageView` is sampled with `VK_FILTER_LINEAR` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN_EXT` or `VK_SAMPLER_REDUCTION_MODE_MAX_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.
- For each set  $n$  that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to  $n$  at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set  $n$ , with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)
- For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)
- Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command
- A valid pipeline **must** be bound to the pipeline bind point used by this command
- If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set for `commandBuffer`
- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage
- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a

`VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage
- If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- If `commandBuffer` is an unprotected command buffer, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be a protected resource
- The current render pass **must** be `compatible` with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.
- The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.
- Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set
- Image subresources used as attachments in the current render pass **must** not be accessed in any way other than as an attachment by this command.
- If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.
- If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set
- All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have valid buffers bound
- For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)
- If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `buffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- `offset` **must** be a multiple of 4
- `commandBuffer` **must** not be a protected command buffer
- If the `multi-draw indirect` feature is not enabled, `drawCount` **must** be 0 or 1
- `drawCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`
- If `drawCount` is greater than 1, `stride` **must** be a multiple of 4 and **must** be greater than or equal to `sizeof(VkDrawIndexedIndirectCommand)`
- If the `drawIndirectFirstInstance` feature is not enabled, all the `firstInstance` members of the `VkDrawIndexedIndirectCommand` structures accessed by this command **must** be 0
- If `drawCount` is equal to 1, `(offset + sizeof(VkDrawIndexedIndirectCommand))` **must** be less than or equal to the size of `buffer`
- If `drawCount` is greater than 1, `(stride × (drawCount - 1) + offset + sizeof(VkDrawIndexedIndirectCommand))` **must** be less than or equal to the size of `buffer`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `buffer` **must** be a valid `VkBuffer` handle
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called inside of a render pass instance
- Both of `buffer`, and `commandBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Inside	Graphics	Graphics

The `VkDrawIndexedIndirectCommand` structure is defined as:

```

typedef struct VkDrawIndexedIndirectCommand {
    uint32_t    indexCount;
    uint32_t    instanceCount;
    uint32_t    firstIndex;
    int32_t     vertexOffset;
    uint32_t    firstInstance;
} VkDrawIndexedIndirectCommand;

```

- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
- `firstInstance` is the instance ID of the first instance to draw.

The members of `VkDrawIndexedIndirectCommand` have the same meaning as the similarly named parameters of `vkCmdDrawIndexed`.

## Valid Usage

- For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)
- `(indexSize * (firstIndex + indexCount) + offset)` **must** be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer`
- If the `drawIndirectFirstInstance` feature is not enabled, `firstInstance` **must** be `0`

To record an indexed draw call with a draw call count sourced from a buffer, call:

```

void vkCmdDrawIndexedIndirectCountKHR(
    VkCommandBuffer                                commandBuffer,
    VkBuffer                                         buffer,
    VkDeviceSize                                     offset,
    VkBuffer                                         countBuffer,
    VkDeviceSize                                     countBufferOffset,
    uint32_t                                         maxDrawCount,
    uint32_t                                         stride);

```

or the equivalent command

```
void vkCmdDrawIndexedIndirectCountAMD(  
    VkCommandBuffer  
    VkBuffer  
    VkDeviceSize  
    VkBuffer  
    VkDeviceSize  
    uint32_t  
    uint32_t  
                                commandBuffer,  
                                buffer,  
                                offset,  
                                countBuffer,  
                                countBufferOffset,  
                                maxDrawCount,  
                                stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `countBuffer` is the buffer containing the draw count.
- `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
- `maxDrawCount` specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndexedIndirectCountKHR` behaves similarly to `vkCmdDrawIndexedIndirect` except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.

## Valid Usage

- If a `VkImageView` is sampled with `VK_FILTER_LINEAR` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN_EXT` or `VK_SAMPLER_REDUCTION_MODE_MAX_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`
- Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.
- For each set  $n$  that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set **must** have been bound to  $n$  at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set  $n$ , with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)
- For each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in [Pipeline Layout Compatibility](#)
- Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command
- A valid pipeline **must** be bound to the pipeline bind point used by this command
- If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set for `commandBuffer`
- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage
- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a

`VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage
- If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- If the `robust buffer access` feature is not enabled, and if the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
- If `commandBuffer` is an unprotected command buffer, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be a protected resource
- The current render pass **must** be `compatible` with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.
- The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.
- Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set
- Image subresources used as attachments in the current render pass **must** not be accessed in any way other than as an attachment by this command.
- If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.
- If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set
- All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have valid buffers bound
- For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#)
- If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `buffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- `offset` **must** be a multiple of 4
- `commandBuffer` **must** not be a protected command buffer
- If `countBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- `countBuffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set
- `countBufferOffset` **must** be a multiple of 4
- The count stored in `countBuffer` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`
- `stride` **must** be a multiple of 4 and **must** be greater than or equal to `sizeof(VkDrawIndexedIndirectCommand)`
- If `maxDrawCount` is greater than or equal to 1,  $(\text{stride} \times (\text{maxDrawCount} - 1) + \text{offset} + \text{sizeof}(\text{VkDrawIndexedIndirectCommand}))$  **must** be less than or equal to the size of `buffer`
- If count stored in `countBuffer` is equal to 1,  $(\text{offset} + \text{sizeof}(\text{VkDrawIndexedIndirectCommand}))$  **must** be less than or equal to the size of `buffer`
- If count stored in `countBuffer` is greater than 1,  $(\text{stride} \times (\text{drawCount} - 1) + \text{offset} + \text{sizeof}(\text{VkDrawIndexedIndirectCommand}))$  **must** be less than or equal to the size of `buffer`

## Valid Usage (Implicit)

- `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- `buffer` **must** be a valid `VkBuffer` handle
- `countBuffer` **must** be a valid `VkBuffer` handle
- `commandBuffer` **must** be in the `recording` state
- The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- This command **must** only be called inside of a render pass instance
- Each of `buffer`, `commandBuffer`, and `countBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

Command Buffer Levels	Render Pass Scope	Supported Queue Types	Pipeline Type
Primary Secondary	Inside	Graphics	Graphics

### 20.3.1. Drawing Transform Feedback

It is possible to draw vertex data that was previously captured during active [transform feedback](#) by binding one or more of the transform feedback buffers as vertex buffers. A pipeline barrier is required between using the buffers as transform feedback buffers and vertex buffers to ensure all writes to the transform feedback buffers are visible when the data is read as vertex attributes. The source access is `VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT` and the destination access is `VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT` for the pipeline stages `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` and `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` respectively. The value written to the counter buffer by `vkCmdEndTransformFeedbackEXT` can be used to determine the vertex count for the draw. A pipeline barrier is required between using the counter buffer for `vkCmdEndTransformFeedbackEXT` and `vkCmdDrawIndirectByteCountEXT` where the source access is `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT` and the destination access is `VK_ACCESS_INDIRECT_COMMAND_READ_BIT` for the pipeline stages `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` and `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT` respectively.

To record a non-indexed draw call, where the vertex count is based on a byte count read from a buffer and the passed in vertex stride parameter, call:

```
void vkCmdDrawIndirectByteCountEXT(  
    VkCommandBuffer  
    uint32_t  
    uint32_t  
    VkBuffer  
    VkDeviceSize  
    uint32_t  
    uint32_t  
    commandBuffer,  
    instanceCount,  
    firstInstance,  
    counterBuffer,  
    counterBufferOffset,  
    counterOffset,  
    vertexStride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `instanceCount` is the number of instances to draw.
- `firstInstance` is the instance ID of the first instance to draw.
- `counterBuffer` is the buffer handle from where the byte count is read.
- `counterBufferOffset` is the offset into the buffer used to read the byte count, which is used to calculate the vertex count for this draw call.
- `counterOffset` is subtracted from the byte count read from the `counterBuffer` at the `counterBufferOffset`

- `vertexStride` is the stride in bytes between each element of the vertex data that is used to calculate the vertex count from the counter value. This value is typically the same value that was used in the graphics pipeline state when the transform feedback was captured as the `XfbStride`.

When the command is executed, primitives are assembled in the same way as done with `vkCmdDraw` except the `vertexCount` is calculated based on the byte count read from `counterBuffer` at offset `counterBufferOffset`. The assembled primitives execute the bound graphics pipeline.

The effective `vertexCount` is calculated as follows:

```
const uint32_t * counterBufferPtr = (const uint8_t *)counterBuffer.address +  
counterBufferOffset;  
vertexCount = floor(max(0, (*counterBufferPtr - counterOffset)) / vertexStride);
```

The effective `firstVertex` is zero.

## Valid Usage

- If a `VkImageView` is sampled with `VK_FILTER_LINEAR` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
- If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
- If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
- Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`
